came to be more oppressively felt as industry was more and more concentrated in huge concerns, such as railways and factories, where the range of choice between employers is limited, and service involves co-operation with a multitude of other "hands" about whose individual care or dexterity nobody can learn much. The influence of the working class was exerted to obtain a modification of the common law, and the Employers' Liability Act embodies a compromise on the subject. It provides that in five specified cases the workman who has sustained injury through the action of a fellow-workman may bring an action for redress as though he were not in the same employment. Where the injury happens by reason of (1) any defect in the works, plant, or machinery; (2) the neglect of any person engaged in superintendence; (3) the neglect of any person to whose orders the workman was bound to conform when the injury took place; (4) the act of any fellow-servant done in obedience to the rules, by-laws, or instructions (if improper or defective) of the employer or his delegate; (5) the negligence of any signalman, pointsman, or person having charge of a locomotive on a railway, the workman is put on the same footing with the public. But for the purpose of the act "workman" is so defined as to exclude seamen, domestic servants, and any servant not employed in manual labour. When an injury has been sustained notice must be given, and the action must be brought within a limited time, and the amount of the compensation must not exceed three years' earnings of a workman in that employment. If the injury prove fatal, the right of action passes to the dead man's representative. The act was originally passed for seven years only, and since 1887 has been renewed from year to year. Parliament has not found time to place the law relating to this subject on a permanent footing. The above statement, both of the common law and of the effect of the act, must be regarded as summary and popular, not full or precise.

For the previous state of the law and the change made by the act, the reader may consult Macdonell, *The Law of Master and Servant.* For a discussion of the principles involved, see *Essays on Jurisprudence and Ethics* by Sir Frederick Pollock (essay v., "Employers' Liability.") In the present session of parliament (1893) the home secretary (Mr. Asquith) has introduced a bill putting the workman on the same footing with the public whenever he has been injured by the negligence of a person in the service of his employer. The bill applies to seamen. The person employed cannot contract himself out of his right beforehand. The Employers' Liability Act, 1880, is to be repealed. It is impossible to say at present what alterations in the law may follow from this bill. F. C. M.

EMPLOYING CLASS. General F. A. Walker, who has contributed greatly to bring into due prominence the functions discharged by the employer (see EMPLOYERS AND EMPLOYED) in the modern world of industry, draws a distinction (*Wages Question*, ch. xiv.) between what he calls a "false employing class" and the "real employing class," to the latter of which alone these functions in his opinion properly belong. The "false employing class" includes, in the first place, those who hire servants who help their employers rather to consume the wealth they have previously produced than to produce fresh wealth. In the second place it includes artisans who are employers on so small a scale that they have only single apprentices; and in the third place it comprises those who are nominally employers, but practically are partners of the employed; and, fourthly and lastly, it contains those who "cling to the skirts" of the profession. The "real employing class," therefore, is the "comparatively small body of men" which is reached by eliminating these various kinds of "false" employers. L. L. P.

EMPLOYMENT. The number of persons employed in the performance of labour in a country obviously cannot exceed the number of persons capable of labour existing in the country, and, as a matter of fact, it is never for any length of time very much below this number; in all countries the able-bodied unemployed, including not only the men "out of work," but all others who from whatever cause are not engaged in labour, are but a minute fraction of the whole able-bodied population. This is sufficient to show that, broadly speaking, the number of persons employed is regulated in the main by the number of persons seeking employment, or in other words, desirous of earning a livelihood by labour. In a small community, say of ten or twelve persons, living in entire isolation from their fellows, every one would find it easy enough to obtain employment, though he might find that a great deal of employment produced very little food. In a great community where co-operation in the production of wealth is effected by means of exchange, the fact that there is always a certain small proportion of persons seeking employment who are unable to find it is chiefly due to the circumstance that, owing to the division of employments, every kind of production comes to be carried on by people who have by training and experience acquired particular skill in that kind of production, so that when the demand for any one commodity slackens and the number of those who produce it has to be reduced, or at any rate not increased at its normal rate, the persons deprived of this employment are not immediately absorbed in other employments.

EMPTION. The right of the crown, exercised from time immemorial, *to take and buy* "at its need" or "for its use" an indefinite amount of commodities, at such price or on such terms of payment as the circumstances of the case might warrant. It was claimed by Edward I. in 1297 that the king was "free to buy and sell like another"; the advantage to the crown being that such purchases were paid for by tallies, and the amount of the maltolte deducted from the purchase-money (see MALTOLTE). Hall, *History of Custom Revenue*, vol. i. pp. 62, 64; (see also PREËMPTION AND PURVEYANCE).

H. HA.

EMPTIO-VENDITIO. The Roman contract of sale, or of buying and selling as it is called in order to denote its bilateral character, is formed by one contracting party promising to pay a sum of money or price (*pretium*), and the other party promising to deliver a thing (*merx*) in return. The contract is binding by mere agreement between the parties, neither requiring any formality nor delivery on one side, and so belonging to the class of contracts called consensual. *Arrha* (see ARLES; EARNEST MONEY), a sum of money or other object of value frequently given by a contracting party to afford evidence of the contract, and a security for its fulfilment, is not a requisite of the contract itself. There can be no contract of *emptio-venditio* unless a determinate price, or a price which can be made so (*id certum est quod certum reddi potest*), is made part of the agreement. It was at one time a subject of dispute whether the price must necessarily be in money; thus the Sabinian school of jurists maintained that exchange was a species, and the oldest species, of sale, citing in support of their view the lines of Homer—

"Here touched Achæan barks in quest of wine,
They purchased it with copper and with steel,
With hides, with horned cattle, and with slaves."
(Poste's *Gaius*, III. § 141.)

But the view prevailed that sale was a contract distinguished from barter or exchange by the fact that it had for its object the payment of a sum of money for a thing.

When the contract of *emptio-venditio* is complete the vendor is bound to deliver the thing to the purchaser and the purchaser to pay the price of the thing, but one party cannot be compelled to perform his part if the other will not perform on his side. The obligation of the vendor is not to make the purchaser owner of the thing, but only to give him possession of it. If, however, the purchaser is evicted by a third party who has a superior title, the vendor is obliged to make good to him the loss. Ownership of the thing does not pass to the purchaser until possession of it has been delivered to him and he has paid the price, if it is a ready-money transaction. But though the property has not passed to the purchaser, he is subject to the risk (*periculum*) of its accidental loss, *i.e.* of loss which cannot be attributed to the negligence of the vendor from the time of entering into the contract (*respuit emptori*). This rule is only applicable where there is a specific object appropriated to the contract. If the thing is determined only by its genus or kind, the risk does not attach to the purchaser until the thing has been weighed, measured, or counted, and the purchaser has had notice of this having been done. The purchaser, on the other hand, could claim all accessions and profits of the thing bought arising between the making of the contract and the date of delivery.

The vendor is liable on account of defects in the thing sold, not only when he represents that they are absent, or fraudulently conceals their existence, but, according to the law established by the edict of the curule Ædiles, who had jurisdiction over the market, even on account of latent defects of the existence of which he was unaware. Thus in the Roman contract of sale there is an implied warranty that the thing sold is free from defects. Such, in brief outline, are the main features of the contract of *emptio-venditio*, with which those of the English contract of sale of goods may be usefully compared.

E. A. W.

EMULATION, EFFECTS OF, ON SOCIETY. The feeling of emulation may be defined as the desire to excel one's fellow-creatures in any respect whatsoever. It thus admits of infinite variations, produces the most dissimilar consequences, and gives rise to the most contradictory judgments. At its best the spirit of emulation is hardly distinguishable from the desire to achieve greatness or perfection, at its worst the spirit of emulation is hardly distinguishable from envy and uncharitableness. It is, however, an indestructible instinct, which may be schooled but cannot be extirpated, and which is most powerful in the most vigorous natures. Further, it prompts to unceasing effort because it is insatiable. The plain animal appetites may be sated; but emulation incessantly creates anew its object of desire, and, the more it has accomplished, finds the more to be done. Next to the instinct of self-preservation and the instinct of sex, the instinct of emulation has probably had greater effects than any other upon the economic history of mankind. We may consider its effects shortly under three heads: (1) *Emulation in accumulating wealth*, (2) *Emulation in expending wealth*, (3) *Emulation in other directions.*

(1) Emulation in accumulating wealth. The desire to be richer than one's neighbour, to excel him in the power and consideration given by wealth, has been a prime factor in accumulation. Its force has varied chiefly with two

circumstances: with the degree of desire for wealth characterising any given society, and with the proportion of persons who have had a chance of acquiring riches. As to the former circumstance, societies have differed considerably in the value which they assign to wealth in comparison with the other goods of life. The causes of this difference are too many and too subtle to be enumerated here; but among the most influential are different moral and religious ideals, different stages of political development, different degrees of command over the resources of nature. As to the latter circumstance—the proportion of persons who can indulge a spirit of emulation in the pursuit of riches is exceedingly variable. In many societies a small proportion has been above, and a large part has been below, any active emulation in wealth. Sometimes a class of nobles has owed its pre-eminence rather to birth and to military prowess than to riches, and has therefore been less emulous of riches. Often a class of slaves who were legally incompetent to hold property, or of serfs who were not adequately protected by law in the enjoyment of their property, or a class of underpaid free labourers who could barely earn their daily bread and nothing more, has found it difficult or impossible to rise into a more comfortable condition, still more to compete in a rivalry of riches. In such a case the spirit of emulation dies out, because not fed with hope. These remarks might be illustrated from the history of mediæval Europe, in which the emulation of riches appears as a great force only in certain classes and in certain places. But in such communities as our colonies and the United States of America, in which material well-being is the accepted ideal, in which every citizen has hopes of realising this ideal, and in which the command over natural resources is almost unbounded, the emulation of wealth becomes a passion as universal as it is intense, and impels to an amazing economic development.

It is conceivable, indeed, that emulation in the pursuit of wealth might become so intense as to lessen, not to augment, the wealth of society. Thus a community of men so zealous in the pursuit of wealth that they grudged time, trouble, and money for national defence, or for alleviating social evils, might end in subjection to a foreign power or in mere anarchy; and would in either case be reduced to comparative poverty. The same result might follow if emulation in the pursuit of riches led to a universal disregard of commercial integrity or to a neglect of all liberal culture. For there is no instinct which, if left to itself, will not sometimes defeat itself.

(2) Emulation in expending wealth must be taken to mean emulation in expenditure which is not directly productive. The immediate result of such emulation is to lessen wealth. Its ultimate result will depend on many considerations. Thus the wealthy citizens of Rome rivalled each other in expenditure on public works intended for the health and recreation of the public; the burghers of mediæval Europe in building and endowing churches; the nobles of France in display at Versailles. Clearly each of these modes of emulation in expense differed from the rest in its ultimate economic effects, although each was in the first instance non-productive. Again, emulation in expense has different economic results accordingly as it is the emulation of a productive or of a non-productive class. The courtier of Versailles, when he had squandered his fortune, remained poor or had to squeeze his dependents. The American, when he has spent lavishly in Europe, goes back to his country and works yet harder to make another fortune.

(3) Emulation in other directions. Every form of emulation soon or late produces economic consequences. In all ages wealth has followed power, and has been kept by strength. Few nations have got wealth and none have kept it unless there was an emulation of public spirit and military virtue among their citizens. Intellectual emulation, emulation in knowledge and culture, has always stimulated economic and industrial development, and often most effectually when it has been most free from sordid motives. Thus the wealth of modern Germany is directly due to the intelligence of the age of Goethe and the public virtue of the age of Bismarck. Again, the economic condition of the later Roman empire and of the middle ages must have been considerably affected by the emulation of ascetic piety which withdrew so many of the strongest wills and keenest intellects from the world to the cloister. The immediate result was an economic loss, although this may have been partially countervailed by the civilising influence of many monastic bodies. Even emulation in mere sports and pastimes would be found to influence occasionally the economic state of society. F. C. M.

ENCABEZAMIENTO, a contract between the Spanish treasury and the local authorities, by which, after a preliminary estimate of the taxes to be levied, the latter engaged to collect and remit the amount. The first known *encabezamiento* goes back to 1494. E. Ca.

ENCLOSURES. Of "enclosing," *i.e.* the fencing round of land which had previously lain open, whether as common field or as common waste, we hear but little before the 13th century, when the necessity for statutory regulation points to the existence of the custom and of differences between the lords of manors and their tenants. About the origin of those common rights of pasture which play so important a part in the history of enclosures, there has been much controversy; but there is

an increasing consensus of opinion as to the main legal points. Although in strict feudal theory the land belonged to the king as the supreme landlord, the lords of manors came in course of time to be treated as owners of the soil within the manor, who in various ways granted certain rights over it to their tenants. Land might be cultivated by the tenants for their lord or for themselves according to a common system of husbandry, upon certain terms which in many cases included certain pasture rights. These might be (1) rights over the arable land during the year, when under the three-field system it was lying fallow, or during the period between harvest and the sowing of seed; or (2) the right of herding a certain number of animals in a common close; or (3) rights over the wastes and woods belonging to the manor. Whether the lord could from the earliest times enclose at will is a matter of some controversy, but, by the statute of Merton, 1236 (20 Hen. III. c. 4), a parliamentary sanction was given to the enclosure of wastes by the lord of a manor, provided that sufficient pasture was left for the requirements of his freehold tenants; while by the Statute of Westminster, II., 1285 (13 Edw. I. c. 46), enclosure was permitted as against commoners who, without being tenants, possessed pasture rights by a special grant. Until the middle of the 14th century the enclosure of open fields in the interests of tillage continued, and many agreements were made between lords and commoners destroying the common rights over the arable land between harvest and seed-time, and sometimes involving exchange of land. Since such enclosure simply implied the rearrangement of estates, and required the same resident population as before, while the conversion from wood and waste into arable land—another feature of the time—found employment for a larger population, no grievance could arise, and the agricultural gain was great. But owing to the scarcity of labour after the ravages of the Black Death (1349), and the consequent introduction of the lease system, attention was turned to the advantages of pasture farming over tillage. When to these influences there was added, in the 15th century, a desire to promote commercial interests by increasing the supply of wool for exportation, pasture farming was still more widely introduced. Sheep could not be properly reared upon open commons, or upon the small scattered strips, and thus arose the policy of enclosing commons wherever this was possible, either by force, or by voluntary agreement; while the profits of sheep-farming led to the conversion of much arable into pasture land. Tenants were encouraged to consolidate their holdings, to exchange their strips in the open fields for separate farms, and to divide the common pasture with the lord, or in some way to make an agreement with him. The economic advantage of enclosure for grazing purposes was doubtless great, but the social and political dangers were considerable, as was pointed out by many contemporary writers who dwelt upon the depopulation of vast tracts, the diminished sphere for employment, the increase of pauperism, the pressure of evictions, and the loss of customary rights. These evils became more apparent after the dissolution of the monasteries; the earlier agricultural system had been retained on many estates which were confiscated, and thus passed under the new system, while the customary rights of the tenants were held to be overridden by the royal grant. Various statutes were enacted throughout the 16th century for the encouragement of tillage, but it was not until its close that the danger passed away. Edward VI. issued a commission in 1548, to investigate the matter throughout the country, but it was unable to put an end to the social discontent, which found an expression in Kett's Rebellion in 1549. The subject was summarised in the charge read by John Hales at the opening of the commission, and in the *Brief Conceipt of English Policy* (see ed. 1893 under the title of *A Discourse of the Commonweal of this Realm of England*, and article by Miss E. Lamond, *English Historical Review*, 1891). By the close of Elizabeth's reign complaints about enclosures in the interest of pasture farming seem to have ceased; this was partly due to the encouragement given to the growth and export of corn, a course which had a more beneficial effect in reviving tillage than the many statutes passed with that object. From this time onwards enclosure of waste and common fields alike is chiefly advocated in the interest of tillage, not of pasture. In the 17th century many writers advocated enclosures of common fields for the improvement of tillage. Steps were taken for the draining and enclosing of the fens under the direction of Cornelius Vermüyden, a Zealander, while the Earl of Bedford headed an enterprise for enclosing the level which bears his name. In each case the undertakers were rewarded with a portion of the lands thus reclaimed, and this led under the Commonwealth to serious riots on the part of the fen men, whose customary rights were thus set aside. The only other noteworthy feature in the history of 17th-century enclosing, was occasioned by the financial necessities of Charles I., which led him to institute proceedings against those who had encroached upon the royal forests. Heavy fines were imposed upon offenders who had thus enclosed, but it is doubtful whether the king derived as much profit from this source of revenue as he had anticipated.

Until the reign of Charles II. enclosures were effected by agreement between the owners of land and those who possessed rights of common, commissioners being appointed to allot the

lands; the agreement was ratified by the court of chancery, or by royal licence where crown interests were concerned, but from the reign of Charles II. a parliamentary sanction was required. This was only given after the consent of the landlord, the tithe owner, and four-fifths of the commoners had been obtained in favour of enclosure. During the first half of the 18th century enclosing continued slowly; but the rise of a moneyed class interested in agriculture and willing to spend money on agricultural improvements, the increased use of green crops, which raised the profits of tillage, but which could not be profitably worked under the open-field system, the increase of population together with the withdrawal of a large portion from agricultural labour, the difficulty of providing a sufficient food-supply and the danger of dependence upon foreign countries, together with the famine prices produced by the French wars—all these various causes combined necessitated the utmost development of natural resources, and gave an enormous impetus to enclosure both of open fields and of common wastes from about 1760 onwards. The rate of progress is most easily shown by a few figures. In the reign of Anne there were three private bills for enclosure, in that of George I. 16, and under George II. 226, a total of 245 in fifty-eight years, while the sixty years of George III.'s reign show the astounding number of 3209 private bills as well as the general enclosing act of 1801. Unlike the enclosures of Tudor times, those of the 18th century were entirely in the interests of tillage. It is hard to estimate by how much the actual area brought under tillage was extended, since a great many enclosures affected open fields already under cultivation. In 1797, when over 1720 private bills had been passed, the select committee on enclosures reported that of the 46,000,000 acres which England was supposed to contain, about 7,800,000 were uncultivated wastes, while 1,200,000 were in the state of common fields, and it has been estimated that about 4000 parishes, containing open fields, chiefly in the eastern and some of the midland counties, out of a rough total of 8500, were enclosed between 1760 and 1844. Where such enclosures took place with due regard to common rights the gain was great, as the customary course of agriculture, and the difficulty of introducing changes such as machinery or a better rotation of crops, were almost insuperable obstacles to improvement. The enclosure of the wastes was also an economic gain, for in many cases they were previously worthless, the cattle reared on them were of an inferior kind, and, as Sir John Sinclair pointed out in an address incorporated in the report of the select committee of 1795, it was found more profitable to hire land for the breeding of sheep of a more valuable sort than to turn them on to a common for nothing. Nor must it be forgotten that though much suffering was probably inflicted, still it was a social gain to clear some districts of an idle and lawless population—the haunts of thieves who, more especially near the capital, were a public nuisance,—while the draining of vast tracts was not without beneficial effects upon the public health. In many cases the enclosures, as carried out, were hurtful to the labourers, whose cottages had been on the commons, and who had been able to keep a cow, which was no longer possible when enclosure of the open fields and of the waste deprived them of customary pasture rights—often without compensation. The expense of enclosing and the loss of pasture rights is one of the many causes which contributed to the disappearance of the yeomanry during this period. The force of the argument against enclosures lies in the fact that the poor did not in many cases receive compensation for the loss of traditional rights. The enclosure bills did indeed provide that all legal rights should be regarded, and on the whole the commissioners tried to act fairly, but the expense of enclosing was very great; much of the money compensation paid to the commoner was swallowed up in legal expenses, and the poor man was doubtless at a disadvantage in contesting the rival interests of a wealthy neighbour. After receiving reports from various select committees which had communicated with the board of agriculture, parliament in 1801 passed a general enclosing act (41 Geo. III. c. 109) with the object of cheapening and facilitating the process of enclosure, and of thus protecting the interests of the poor. By the act certain general provisions were laid down, which rendered the private acts shorter, though the expense of an application to parliament, and of referring contested cases to a parliamentary committee, still remained.

In 1836 an act (6 & 7 Will. IV. c. 115) was passed by which enclosure of common fields was facilitated. Possessors of common rights to the number and value of two-thirds might nominate commissioners to carry out enclosure of common fields, provided that these were beyond certain distances of the larger towns.

By the general enclosure act of 1845 (8 & 9 Vict. c. 118) this method was extended to the common wastes. An enclosure commission was appointed to deal with land of various kinds in England and Wales. (1) All lands held in severalty, or subject to definite common rights, could be enclosed by the authority of the commissioners without parliamentary sanction. By 15 & 16 Vict. c. 79, the commissioners were, however, forced to submit proposals dealing with land as above described to parliament. (2) All lands over which undefined rights of common existed—and all wastes within 15 miles of London, or within certain distances of other

towns. In such cases the commissioners held an inquiry, and then drew a scheme; all the schemes for the year being presented to parliament in one general act. The commissioners were thus substituted for the parliamentary committee, and it was hoped by the promoters of the measure that examination on the spot would prove a security to the poor, whose interests were directly protected by clauses empowering the commissioners to make allotments and recreation grounds. (3) Village and town greens, as well as the New Forest, and the Forest of Dean, were excluded from the operation of the act.

In 1852 parliamentary sanction was made compulsory for the enclosure of land held in severalty without definite common rights. In 1893 the statute of Merton, though not repealed, was greatly modified; and no enclosure may henceforth be made under that act without the consent of the board of agriculture, which in dealing with such proposals is instructed to carry out the requirements of the Commons Act of 1876, when considering applications for the general enclosure of a common.

ENCROACHMENT. See TRESPASS.

ENCYCLICAL. The encyclical of Pope Leo XIII. on the condition of labour, dated 15th May 1891, which is the subject of this notice, receives its name from its opening words *Rerum novarum*. Here, as in previous encyclicals, notably the one *Quod Apostolici Muneris*, issued in the first year of Leo XIII. (1878), the question of capital and labour is considered mainly in its connection with the recent advances of socialism. It offers us, as M. Charles Périn, emeritus-professor of the University of Louvain, puts it, a "synthesis of the economic order according to the divine laws which regulate human conduct," and it is important as constituting "la vérité catholique pour l'ordre économique," or, as we should put it, an authoritative statement on the part of the Roman Catholic Church on the economics of labour. Its distinguishing feature is the introduction of the principles of justice and charity in the solution of economic questions. The encyclical opens with an allusion to the "spirit of revolutionary change," and the influence of this in the "field of practical economy"; it dwells on the danger of social agitation in the presence of real grievances such as "the misery and wretchedness which press so heavily at this moment on the larger majority of the very poor," and the isolated and defenceless condition of working men, "the callousness of employers, and the greed of unrestrained competition" (*Encyclical Letter*, official translation, p. 4). It then proceeds to examine the remedies proposed on the one hand by socialists, which it condemns, and those which are within the province of the church and state, which it recommends, dwelling in conclusion on self-help by means of association and the importance of a wider diffusion of Christian charity in all human relationships which strikes at the root of all social evils. (1) The socialistic proposals are characterised as unjust and tending to rob lawful possessors, and putting the state into "a sphere that is not its own" (p. 5), and thus depriving the labourer of the liberty of choosing his own employer and using the proceeds of his work. Private property is defended, as against the socialistic recommendation of collective ownership as being "according to nature's law," whilst, "the authority of the divine law adds its sanction" (pp. 7, 8); and, considering the rights of the family as co-ordinate with those of the state "our first and fundamental principle, therefore, when we undertake to alleviate the condition of the masses, must be the inviolability of private property" (p. 11). The pope here falls into the common error of supposing that all private property is excluded in the schemes of modern socialism, whereas it is only instruments of production—private ownership in lands, capital, and machinery—which are to be abolished and become state property, the state directing the process of production, with the disappearance of the wages system in the socialistic state. (2) The encyclical declares inequality as in the nature of things permanent, and points out the methods of the church under these circumstances for remedying the evils arising therefrom. It is the duty of the church to teach and to train men in the principles of social ethics (pp. 18, 19), whereby the poor may learn "to suffer and endure" and to abstain from violent measures in compassing their ends, whilst the rich are taught to "religiously refrain from cutting down the workman's earnings, either by force, by fraud, or by usurious dealing" (pp. 13, 14). The church, too, in her institutions, as in the past, guards the "patrimony of the poor" by means of "deposits of piety" flowing from Christian self-sacrifice and charity. (3) The state as the organ of distributive justice protects each class with a view to the common good; all well-constituted states are bound "to provide those bodily and ex-

ternal commodities *the use of which is necessary to virtuous action.*" "It is only by the labour of the working man that states grow rich. Justice, therefore, demánds that the interests of the poorer population be carefully watched over by the administration" (pp. 22, 23). Sunday rest, and the protection of health and the prevention of excessive labour of children and females being among the subjects demanding state interference, as also the restraint of the disturbers of social peace, "to save the workman from their seditious arts, and to protect lawful owners from spoliation" (p. 25). On the wages question Leo XIII. proves himself to be "le pape des prolétaires" in demanding of the state protection against unscrupulous employers, who under a semblance of free contract deprive the labourer of his due. Distinguishing between this theory and facts, between normal wages and fair wages, he points out that the working man, having nothing but his wage to fall back upon for a livelihood, is bound to come to terms with the master even to his own disadvantage, unless he is protected by the state or boards of conciliation authorised by the state to secure the rights of both parties of the contract, and this on the equitable principle that "each one has a right to procure what is required in order to live" (p. 28). (4) In the last place the pope recommends association and corporation as after the pattern of Christian confraternities under the fostering influence, though without undue controlling power, of the state as means of mutual support and protection against encroachments; but it is by a return to Christian faith and charity alone that the evils of society can be cured in the end,—so concludes the encyclical which thus becomes what Anatole Leroy-Beaulieu, in his appreciative study of *La Papauté, le Socialisme, et la Démocratie*, calls "un code de morale sociale" (see pp. 66, 67). But also, as the same writer points out, so far from coming into conflict with the principles of political economy, as now understood, the encyclical is on a line with its most recent developments (*ib.* p. 50), adding to the moral factor the religious forces without which selfishness and greed would be the only prompting motives of economic action.

L. O'Donnell, Chapman and Hall, 1892, gives the text of the encyclical in an appendix.—Henry George, *On the Condition of Labour*, 1891.—Also W. T. Stead, *The Pope and the New Era*, 1890.] M. K.

ENDORSEMENT. See BILL OF EXCHANGE.

ENDOWMENTS. Adam Smith in a well-known passage[1] has written strongly on the subject of endowments. In his eyes they tend to hinder capital and labour from taking their natural course. In certain professions, notably that of holy orders, the existence of endowments, to encourage and support those who are preparing for them, has attracted large numbers of men who would otherwise have carried their energies into different fields. Hence a depression of incomes in those professions, for the number applying for employment in them is greater than the work requires. A change in circumstances since Adam Smith wrote has robbed his particular instance of much of its force, for the endowments in question have, as a rule, been diverted, and the growth of population coupled with well-defined religious revivals has greatly increased the work of the clergy. But Adam Smith goes farther, and maintains that, tested by experience, endowments have failed to secure any good object. The universities, he says, are largely endowed, and have failed to make any great additions to the learning of the country, which is no more than might have been expected *à priori*, for the motive to exertion being removed by the certainty of income independent of it, exertion itself would tend to diminish. Dr. Johnson,[2] though not accepting Adam Smith's conclusions, put the same argument in a popular form when he says, "Why, sir, we would all be idle if we could."

As the growing tendency of the present time is to employ endowments for the advancement of learning or the furtherance of education, it may be worth while to examine the reasoning at greater length. The objections to endowments may be put in the form of a dilemma—either a given result is worth having, and then the public are ready to pay for it, or the public is not ready to pay for it, and then it is not worth having; in the one case endowments are superfluous and cripple energy, in the other they are wasted. It will be observed that this argument is based on the assumption that the public are the best judges in such matters. To this it is objected that although the common exchanges of life may safely be left to competition, and the public are able to judge of quality in the matter of tea, sugar, etc., the case is very different when learning and the higher forms of education are involved. The public, or at least the English public, are not qualified to discern good and bad in such matters. The demand for books and teaching in the highest subjects is never likely to be sufficient to make it worth any one's while to write upon or teach such subjects as a profession, and many persons who have the ability and the taste requisite are powerless to pursue the subjects for want of

[1] *Wealth of Nations*, bk. i. chap. x.; cp. bk. v. chap. i., art. ii.

[2] Boswell's *Life of Johnson*, A.D. 1776.

means. In such cases endowments, it is argued, may profitably be used to provide the means of subsistence for men who are in reality great public benefactors. Certain chairs, for instance, at the universities need endowments to support their holders in the absence of a sufficient number of students ready to pay fees to maintain their teacher. Certain forms of study and research are never likely to be sufficiently remunerative to provide those who pursue them with the means of livelihood, and must consequently be endowed. Outside these special cases it is readily granted that endowments, by making men independent of their exertions, tend to weaken their industry; but unless these particular subjects are endowed, the level of learning and of teaching is likely to be lowered, for the subjects studied and taught will be those, and those only, which bear directly on practical life. The question is not, perhaps, one which admits of a final answer. The enthusiasm which leads a man to adopt an unpopular subject may in many cases be trusted to keep him industrious, independently of reward. A certain habit of mind is observable in those who are mainly supported by endowments, a tendency to delay publication, an excessive self-criticism, a want of definiteness—all these go far to postpone, if not to destroy the realisation of the results of their work. It has been remarked that in this country a large amount of the best work has been done by men who have a regular employment, and with whom the advancement of learning is a secondary occupation. J. S. Mill, *e.g.*, wrote his principal treatises in the intervals of his work as a clerk in the India House. Grote's *History of Greece* was the work of a banker, and other instances might be quoted. In the great majority of cases a certain amount of teaching is a help and not a hindrance to research. The most successful use of endowments has, perhaps, been in cases where they have been employed to support men who have already made themselves a name in a subject, and who have been set free from the necessity of working for their daily bread at some occupation which they have hitherto practised. But the method of distributing endowments is distinct from the question of their inherent advantages or drawbacks. In German universities endowments are, as a rule, only a part of the income of a professor, the proportion that he earns by fees being greater or less as his subject is popular or the reverse.

Apart from the encouragement of research, endowments are largely used to forward the higher education of the country. The universities expend large sums annually in scholarships to attract students; and fellowships, being now largely used as prizes at the end of a university course, are additional inducements to students to undertake it. The consideration of poverty enters but little into their distribution. Here again a question may be raised as to the wisdom of such a policy. Studies, it will be urged, which are not self-supporting in the sense of attracting students by their own charms, are not worth supporting at all. Others will hold that studies which do not bear directly on practical life (in German phrase are not "bread studies") have a value of their own, of which the public are not the best judges, but which make it worth while to support them by endowments; and that while studies which are a direct preparation for business may safely be left to themselves, it is the interest of a country to preserve others from extinction. We have in England no logical principle applied to the graduation of studies or their mutual relation; but the tendency of the present day is to use endowments largely to facilitate the passing from the lower to the higher grades. Instances are not wanting of those who by their means have risen from elementary schools to high places in the universities. In practice it must be owned that endowments often (1) cheapen education for a class who can perfectly well afford to pay for it, by providing plant, etc., for the great public schools and the universities; (2) enable poor men to live at a needlessly expensive rate, which is determined by the standard of comfort set by more wealthy companions.

Two subsidiary points may be mentioned.

1. The system of confining the advantages of endowments to certain localities is being gradually modified. It is argued that migratory habits and facilities of communication have greatly lessened the reality of local divisions; that, on the whole, every locality gains by the process; that waste is avoided, and the supply of endowments made to correspond more nearly to the number of persons qualified to make a good use of them.

2. The abolition of any poverty qualification, mentioned above, has been severely criticised. It may be defended on the ground that it is almost impossible to make such a qualification real. Poverty is difficult to define, and it is impossible to formulate any system of compensation as between ability and want of means. Moreover, on the whole, the present tendency to distribute endowments by competition, making ability and not poverty the test, tends to raise the whole level of education, and so to benefit the poor; whilst the spur of poverty is sufficient to ensure industry, and the temptations to idleness which go with wealth are, in the great majority of cases, strong enough to prevent members of the wealthy class from competing successfully.

[Mill, *Pol. Econ.*, bk. v. chap. xi. § 15.—Turgot, *Fondation et Fondations*, Œuvres, vol. iii., ed. 1808.] L. R. P.

ENEMY GOODS. In early times the pro-

perty of the enemy, wherever found, was liable to capture. By custom and treaty the harshness of this rule has been modified, and the modern practice may be summed up as follows:—(1) Movable property belonging to an enemy state may be appropriated; immovable property may be occupied but not alienated. (2) Movable private property is liable to contribute to the support of the invading army, contributions and requisitions being levied for that purpose; immovable private property is exempt from appropriation. (3) Private property on the high seas is liable to capture except where it is on board a neutral vessel. (4) Private property within the jurisdiction of the belligerent is not as a rule liable to capture.

[*International Law*, by W. E. Hall, Oxford, 1890. Many writers advocate the exemption of private property at sea from capture. The United States has more than once made this proposal, and in some modern wars this principle has been followed. See De Laveleye, *Du Respect de la Propriété Privée en Temps de Guerre.*—Bluntschli, "Du droit de Butin," *Rev. de Droit International*, tom. ix. and x., and articles in the same review by M. Vidari, tom. iii. (1871).—M. Gessner, tom. vii. (1875), and the reports presented to the Institute of International Law, tom. viii. (1875).] J. E. C. M.

ENFACED PAPER OR RUPEE PAPER. The title applied by stock exchange custom to Indian government securities, the interest on which is payable in silver rupees. The capital also is expressed, or enfaced, on the certificate as being so many silver rupees, the value of which in the London market varies according to the value of silver in relation to gold. The word "enfaced" might almost as well be applied to any other kind of security, inasmuch as all have more or less on their face a description of the security represented. Custom, however, has lent the word simply to those Indian rupee stocks which bear interest at 4 per cent and upwards, the interest of course being payable in silver, and subject to an increase or decrease in sterling value according to the value of silver in the bullion market. The Indian government cannot borrow so easily or at so low a rate of interest in silver as it can in gold, the mass of investors having been repelled by the possibility of fluctuations in the sterling value of the interest receivable. At the same time it has been thought well by Indian statesmen to avoid accumulating a large sterling debt, lest the Indian government should some day encounter a heavy fall in the value of silver, which would compel it to tax the natives of India to the extent that more rupees would be required to provide each pound sterling. A. E.

ENFACEMENT is the converse to endorsement (see BILL OF EXCHANGE). The word does not appear to have been in use before the year 1858, when the Indian Government decided to pay the interest on the Indian home debt in London by means of drafts at sight on India, and issued the following notification:—

"When holders of notes in Calcutta desire that the interest thereon should be made payable by bills issued in London, they must present their notes at the office of the Accountant-General to the Government of India, where an enfacement will be made on each of the notes in question as follows: *Interest payable in London by draft on Calcutta* (or Madras, as the case may be)."

[Geo. Clare, "Stock Exchange Securities," *Journal of the Institute of Bankers*, vol. xiv. p. 226.]

ENFANTIN, PROSPER, called "Le Père" (1796-1864), was born at Paris and died in the same city. Having first been, in conjunction with BAZARD (*q.v.*), a leader, he became, after Bazard retired, the sole chief of the St. Simonians, and did his utmost to promote the success of that economico-religious sect, up to the date of its fall. Commencing as a devotee of mysticism, Enfantin finally adopted the doctrine of "free love"; this brought him into trouble with most of his fellow-religionists. He was condemned on 28th August 1832 by the assize court of the department of the Seine, in company with Charles Duveyrier and Michel Chevalier, to a year's imprisonment and a fine of 100 francs, for having assisted, without previously obtaining permission, in the formation of an association consisting of more than twenty members, and in the promulgation of articles injurious to public morality.

The penalty was before long commuted, and Enfantin made his way to Egypt, where he studied the question, now long since settled, of piercing the Isthmus of Suez.

Subsequently, after remaining for several years at Tain (Drôme), he returned to Paris, and was appointed, in 1845, a director of the first company for constructing a railway from Paris to Lyons.

After the revolution of 1848 he founded, in conjunction with Charles Duveyrier, the journal *Le Crédit*, which continued to appear till 1850. Finally Enfantin became the administrator of the second Paris, Lyons, and Mediterranean Railway Company—a post which he continued to hold till his death.

Before the fall of the St. Simonian School, Enfantin published, in conjunction with others, *Doctrine de St. Simon, Exposition*, 2 vols. 8vo, 1830-32; afterwards, in his own name, *Économie politique et Politique*, 1 vol. 8vo; *Morale*, 1 vol. 8vo, etc. After the dispersion of the St. Simonian School, Enfantin wrote a volume, *Colonisation de l'Algérie*, 1843, 8vo, in this, across a web of original ideas and among passages which show deep historical study, may be traced the opinions of the early socialists.

His works were collected by zealous disciples, and printed in 9 vols. 8vo, 1866-73. A. C. f.

ENFRANCHISEMENT, the liberation of the serf from his forced astriction to his lord's estate, and his forced labour for his lord's behoof. Though not liable, like the slave, to be sold from master to master, or to give his whole time to his master's work, the serf was still practically chained to the estate to which the right to his labour was legally appendant, and he could still be compelled to his work by whips or imprisonment at his master's will. There was a third strand in his bondage—his subjection to his lord's civil and criminal jurisdiction, which left him defenceless against arbitrary exactions, and therefore operated often quite as injuriously on his economic position as the other two, but it was not felt to involve the same personal indignity as they did, and the serf is commonly considered enfranchised when he is released from them, although he may continue subject to his lord's general authority. Enfranchisement has proceeded perhaps more generally from moral than from economic motives, but it has usually justified itself immediately, and always eventually, by bringing with it a decided economic advance. The pinch of serfdom was the forced labour; when that was commuted to a money payment the astriction to the estate fell away of itself, for want of any practical reason for enforcing it longer. But though the astriction to the spot was less grievous to individuals—except indeed among the Russian peasantry, whose chief complaint, Haxthausen tells us, always was that it restrained their idle propensity to rove—it was always most pernicious to the progress of the community, because it stopped all division of labour, limiting occupations to the little round of work in a rural village, and preventing the rise of towns, and trade, and manufactures. Russia consequently, where serfdom was only abolished in 1861, is still, in spite of the acknowledged industrial gifts of its people, little more than a vast nation of crofters, every man half indifferent agriculturist and half indifferent tradesman; and even in agriculture, though it is now one of the largest exporters of grain in the world, its system of husbandry continues almost primitive, and there has never arisen a modern farming class with the requisite skill and capital for practising improved methods. The ill effects of the forced labour were always more directly obvious. The serf who got a small holding to cultivate for his own support, but was obliged to give three days a week (the usual quota) to his lord's work, could neither do justice to his own fields nor to his lord's,—not to his own because he was called away from them precisely when he most required to be upon them, and not to his lord's because he gave his labour reluctantly, sometimes with bitter ill-will, and he had no interest except to give as little of it as he dared. His holding is sometimes called the wages for his labour, and his labour the rent for his holding; but that was a bad form of wages, because it repressed instead of encouraging the labour it was supposed to reward, and this was a bad form of rent, because it interfered with the proper cultivation of the land which was supposed to yield it. Serf labour, like all discouraged labour, was habitually indolent. Professor R. Jones was informed by the English engineer who superintended the making of the road from Hamburg to Berlin in 1830, that the Prussian free labourers he employed broke thrice as much granite in the day as the Mecklenburg serfs, and that when he tried to animate the latter by mixing them in the same gangs with the former, the experiment failed because it had exactly the contrary effect of making the free labourers slacken their exertions to the bond pace (*Distribution of Wealth*, p. 52). The peasants on Russian state lands, whose labour rents were commuted into money rents long before the universal emancipation, are much more energetic, enterprising, and prosperous than the recently-emancipated serfs (Thun, *Landwirthschaft u. Gewerbe in Mittelrussland*, p. 43). Roscher quotes two authorities who made personal investigations into the relative industrial capacity of serf and free labourer in the same communities, and one—Jakob—counted two free labourers equal to three serfs, while the other—V. Flotow—counted three free labourers equal to four serfs (*System d. Volkswirthschaft*, i. 152). The difference is still more strikingly shown by Hanssen, who mentions that on the estate of Rixdorf in E. Holstein, where labour rents were commuted in 1780, it required ninety-two horses and seventy-five men to work the home farm before the commutation, and only thirty-six horses and fourteen men after it (*Aufhebung der Leibeigenschaft in Schleswig u. Holstein*, p. 39). Usually, too, though the labourers were fewer the harvest was greater. The eminent Danish statesman, Count J. H. E. von Bernstorff, finding he could not with serf labour make his property yield enough to pay the taxes, freed the serfs in 1767, paid them wages for the work they did, and obtained a net return of £150 a year (Sugenheim, *Gesch. d. Aufhebung d. Leibeigenschaft*, p. 500). Storch mentions that he nearly tripled the production of his estate by this enfranchisement, raising his product of rye in the ratio of from 3 to $8\frac{1}{3}$, of barley from 4 to $9\frac{1}{3}$, and of oats from $2\frac{2}{3}$ to 8 (*Cours d'Économie polit.*, iv. 306).

In factory work it has been generally found impossible to employ serf labour remuneratively at all. Haxthausen found some old serf factories in Russia during his visit, but they were in a very languishing condition, and most of the Russian manufacturers, though they had generally begun with their unemployed domestic serfs, and then changed them for some of their agricultural serfs who were stronger, had all in the end to learn the same secret—that the

Russian was a bad workman when he worked on compulsion, but became an excellent workman when he worked for hire. Force extorts but the minimum of effect; it is hope that draws out the maximum. They consequently set their serfs free, imposed a small annual charge as commutation duty, and engaged them in the ordinary way for wages (*Russian Empire*, i. 110), precisely as Storch says had been done in Moscow factories as far back as 1805 (*Cours*, iv. 30).

Enfranchisement has occasionally resulted ill, but that has been due either to moral defects in the particular individuals or groups enfranchised, or to the excessive burden of the compensation dues or other conditions of the enfranchisement. Freedom necessarily contains the possibility of doing worse as well as the possibility of doing better. J. G. Kohl repeatedly came across villages in Little Russia with free peasants living on one side and serfs living on the other, and he always found that while the most prosperous inhabitants of the village were among the free peasants, so also were the most miserable (*Reisen im Innern von Russland*, ii. 300). On the Zamoiski estates in Poland, enfranchisement seems to have had a curious double action; it tripled the production on the proprietor's fields (Cox, *Travels in Poland*, i. 22), but it had a bad effect on the serfs' own, because they became drunken and neglected their work (Burnett, *Present view of Poland*, 106). The great Russian emancipation of 1861 is the most notable example of the natural and good operation of enfranchisement being vitiated by concomitant economic and social conditions. J. R.

ENFRANCHISEMENT OF LAND FROM COPYHOLD AND SIMILAR TENURES, HISTORY OF. The enfranchisement of copyhold lands in England has passed through three stages. It is necessary for the purpose of tracing its history to consider (1) enfranchisement at common law; (2) voluntary enfranchisement under the copyhold acts 1841-1887; (3) compulsory enfranchisement under the copyhold acts 1852-1887.

1. Enfranchisement at common law. Copyhold lands and lands of similar tenure must, according to the law of England, be "parcel" of a manor, or in other words, wherever lands are held by copy of court roll, the freehold in those lands is in other hands than those which hold the "copy." The process of enfranchisement unites, in the hands of the copyholder, the freehold and the copyhold interest. It is evident that nothing short of the whole freehold interest will suffice to clear the land of all its copyhold incidents, and therefore an enfranchisement at common law may be effected "by any lord entitled to the manor in fee simple, or who has a power to enfranchise or a power of sale and exchange," but it cannot be effected by a lord with a more limited interest or less extensive powers. An enfranchisement, therefore, before the year 1841, was carried out through a conveyance of the fee simple of the copyhold in question, from the lord of the manor to the tenant for an agreed price. The fact that the tenant himself had only a limited interest in his copyhold estate did not affect the validity of the enfranchisement, which would enure for the benefit of the estates of those who succeeded him. Unless special provisions were inserted in the conveyance, three somewhat unexpected results would follow from the enfranchisement. (1) That the mines and minerals would pass from the lord to the copyholder; (2) that the copyholder's rights of common in the "waste" of the manor would be extinguished; (3) that all mortgages, or other incumbrances affecting the lord's title, would affect the enfranchised lands in the hands of the quondam copyholder. It will be readily understood that the difficulties attending enfranchisement, under such conditions, rendered the conversion of copyholds into freeholds a cumbrous and costly process.

In 1802 we find, in the Land Tax Redemption Act, provisions which enable owners of limited estates in manors to make enfranchisements for the purpose of obtaining money for redeeming the land tax. This appears to be the first indication of the principle subsequently worked out in the copyhold acts.

2. In the year 1841 was passed the first of the acts which "provide the means for an adequate compensation for the rents, fines, and heriots payable to the lords of manors, in respect of lands of copyhold and customary tenure, and for facilitating the voluntary enfranchisement of such lands, and for improving such tenure." This act created a body of commissioners called the copyhold commissioners, now the land commissioners, whose consent and approval must be obtained to enfranchisements made under the act. Under this protection the legislature felt itself enabled to give authority to the lord of any manor, "whatever may be his estate or interests therein," to enfranchise "all or any of the lands holden of his manor," and to any tenant, "whatever may be his estate and interest," to accept such enfranchisement. The consideration was payable in money, but by agreement such money might be made payable at a future time. Whenever the lord who enfranchised had a limited interest only, the money, so soon as it was paid over, was to be invested, and to be subject to the same trusts as those affecting the manor to which the enfranchised copyhold had previously belonged. It was now enacted that any rights of common belonging to the land enfranchised should continue to be attached thereto after it had become freehold, and that the lord's right to

mines and minerals, under the enfranchised land, should not pass upon the enfranchisement unless expressly commuted. Upon payment of the sum payable for enfranchisement, the tenant was authorised to charge it upon the lands enfranchised, with all the powers and rights of a first mortgagee. Finally, the title to the enfranchised copyholds was to be separated for ever from the title to the manor.

By this act, therefore, three of the main impediments to general enfranchisement were done away with; for (1) it was no longer necessary to obtain the conveyance from an absolute owner; (2) it was no longer necessary expressly to reserve the lord's mines and minerals and the tenant's rights of common; and (3) the enfranchised copyholder had nothing to fear from any encumbrances clogging the estate of his former lord. But enfranchisement still remained a matter of agreement, and could not be forced upon an unwilling lord. Amending acts are a sure sign that a statute is not a dead letter, and the Copyhold Act of 1841 was followed by those of 1843 and 1844. The act of 1843 provided that the consideration for enfranchisement, which under the act of 1841 was a lump sum of money, might in future be paid wholly or in part by an annual rent charge, or might take the shape of a conveyance of lands forming part of the manor to which the enfranchised lands had previously belonged. The act of 1844 extended the last-mentioned provision to any lands which, in the opinion of the copyhold commissioners, could be conveniently held with the manor to which the enfranchised lands had previously belonged, although themselves not belonging to such manor.

These three acts of 1841, 1843, and 1844, constituted a short code under which voluntary enfranchisement could be satisfactorily carried through. But it was not until 1852 that compulsory enfranchisement became possible for either lord or tenant.

3. The system of compulsory enfranchisement, which was inaugurated by the Copyhold Act of 1852, was applied in the first instance to those copyholds only to which a new tenant was admitted on or after 1st July 1853, or in other words, so long as an existing estate in the copyhold continued to subsist, neither lord nor tenant could force an enfranchisement upon tenant or lord. But six years' experience of the act of 1852 enabled the legislature to extend its provisions to all copyholds whenever the last admission had been made to them.

The key-note to the system of compulsory enfranchisement is valuation of the lord's interest by independent valuers, under the supervision of the copyhold commissioners. The difficulty which compulsory enfranchisement had to deal with was the amount of compensation to be paid to the lord in respect of fines and other sources of profit to which, if the copyhold interest continued, he would become entitled at uncertain intervals, and which, upon enfranchisement, required to be turned into money once and for all. Without going into the meaning as to "the lord's fine," it may be sufficient to say that such fines are payable when a new tenant is admitted, that is, entered upon the court rolls as the person holding the copyhold tenement "according to the custom of the manor." Originally the price given to induce the lord to accept the new tenant, the fine, was in its nature arbitrary and uncertain, and depended in each manor upon the custom of that particular manor. But the courts of the king had, at an early date, established that the courts of the manorial lords could not by custom give efficacy to unreasonable fines, and in course of time developed the working rule that "two years' improved value of the land, after deducting quit-rents," was the maximum amount which the lord of a manor should be entitled to receive upon the admission of a new tenant.

How then does the act of 1852 meet this problem? In the first place all fines and other manorial dues, payable upon the admission, which under that act supplies the opportunity for enfranchisement, are to be discharged before any further step is taken. Then the valuers, or their umpire, or the single valuer agreed upon by lord and tenant, must ascertain the value of the manorial rights now exercised for the last time. The valuation, when made, must take the form of an award, must be confirmed by the copyhold commissioners, must be registered at the office of the commissioners, and must be entered upon the court rolls. The amount of the valuation, failing agreement, is to be paid by the tenant in a lump sum, if he has claimed the enfranchisement; but if the lord has insisted on the change of tenure, the compensation will, in the absence of express agreement, take the form of an annual rent-charge. In either case the "enfranchisement consideration" is a first charge upon the lands enfranchised.

Two provisions of this act are noteworthy, as showing the caution with which the legislature introduced compulsory enfranchisement. Firstly, power is given to the lord to buy out the copyholder compulsorily if he can show, to the satisfaction of the commissioners, that his "mansion-house, park, garden, or pleasure grounds," may suffer from the tenant's enlarged powers of dealing with the lands which are ceasing to be copyhold. Such a power might well be granted to the lord if the tenant threatened to open a marl pit or cut down standing timber upon land with which he could not so deal whilst still a copyholder. Secondly, if it be found at any time that the person who

purported to enfranchise was not the lord at all, it is provided that the true lord is to recover the consideration for the enfranchisement from the person who wrongfully received it, instead of forcing the tenant to pay the money again and look to the wrong-doer for compensation.

Valuers acting under the Copyhold Act 1852 must take into consideration "facilities for improvement," as, for example, the possibility that the land may become building land, and the hindrances to such improvement, as, for example, the probability that it will not become building land for some years.

The Copyhold Act 1858 is to the Copyhold Act 1852 what the Copyhold Acts 1843 and 1844 are to the Copyhold Act 1841. It contains such improvements as the working of the principal act had suggested. Thus for the deed of enfranchisement specified by the act of 1852, which the parties would execute, was substituted an award of enfranchisement to be made by the copyhold commissioners; owners of at least two-thirds of the value of copyholds held in undivided shares, obtained the power to insist on an enfranchisement whatever their co-tenants might desire; and one form of certificate of charge was provided for securing the payment of consideration money, compensation money, and expenses of enfranchisement, as the case might be.

Speaking generally, the costs of a voluntary enfranchisement are paid in manner agreed by the parties, or, failing agreement, are paid as directed by the commissioners; while the costs of a compulsory enfranchisement are to be paid by the party who has insisted upon abolishing the copyhold tenure.

In 1887, after an interval of thirty years, an act was passed "to make further provisions for enfranchisement" of copyhold lands. An important provision of this act is that the steward of any manor, when a new tenant comes for admission to a copyhold, must hand to such tenant a notice stating that he is entitled, if he desires, to enfranchise the copyhold. A further provision of great importance prevents the lords of manors from making grants of portions of the "waste" of their manors. Again, the tenant may, under the act of 1887, pay the compensation for an enfranchisement on which he has insisted by means of a rent-charge of 4 per cent of the amount of compensation. Finally, the compensation to the steward of the manor is fixed by a schedule to the act, and the land commissioners are directed to "frame a scale of compensation" such as "will be fair and just, and will facilitate enfranchisement."

The scale published by the land commissioners in conformity with this act comprises a table in which is calculated the number of years' annual value payable to the lord, according to the age of the tenant, as compensation for the loss of future fines. This table ranges from the case of a tenant of five years or under, who should pay 2·29 years' purchase, to the case of a tenant of 100 years or upwards, who should pay 5·16 years' purchase. Quit-rents are calculated at twenty-five years' purchase; timber at full value if the lord had the right to enter and cut; at half value if the lord could not enter to cut without the tenant's consent.

Enfranchisements on crown lands, churchlands, and university and college lands, are the subject of special statutes which are not of general importance.

[Brown, *Copyhold Enfranchisement Acts*, 1888. —Scriven, *On Copyholds*, 6th edition, 1882.]

ENGLISH EARLY ECONOMIC HISTORY.

In the present state of historical investigation, it is difficult to give a complete and exhaustive account of the development of political economy in England. Although many writers have devoted attention to the subject, and have reached important conclusions, comparatively little use has been made of the vast stores of material relating to the later middle ages, and the rise and fall of the mercantile system. Particular movements have indeed been carefully investigated, and we are not without indications of the general course of development. To borrow an illustration from mathematics, certain points on the curve of development have been fully ascertained; we have some notion of its shape; we know also that the English curve is only one of a large family of curves, other members of which may be found on the continent. But of its direction between the points already ascertained, and of the differences between it and others of the same class, we know little.

The subject may be best approached by considering the influence of the mediæval church. Before the conversion of the Anglo-Saxons to Christianity there was little or no commerce, although Christian merchants resorted to England while the inhabitants were still pagans, and so brought them into contact with a more highly developed economy than their own. Many of the principles which we find in mediæval economic teaching may probably be traced back to this or an earlier period. The idea, for example, of money as a *pledge*, which exercised an important influence on economic doctrine in England far into the 17th century, was derived from pre-Christian times. Neither the condemnation of avarice nor hostility to usury was peculiar to Christianity. The social system of the middle ages, greatly modified as it was by Christian teaching, had its foundations in a pre-Christian state of society. But making every allowance for the influence of ideas and

customs derived from earlier times, the fact that the new religion obtained a firm hold on the population while industry and commerce were still in their infancy, is of primary importance in tracing the development of political economy. Early economic institutions and laws are stamped with the teaching of the church. Subsequent modifications of doctrine are largely the outcome of the struggle, on the part of the church, to guide or control new economic forces as they gradually came into operation. To follow rightly the course of development it is first of all necessary to understand the position of the church with regard to trade and industry.

From the earliest times the church had had forced upon it the duty of applying the principles of Christianity to social life. Outside Palestine the earliest converts were found in the busy trading centres of Asia Minor ; and the first persecutions were probably due to the fact that the new religion threatened various trading interests, and tended to the overthrow of the existing social system (Ramsay's *Church in the Roman Empire*, pp. 12, 199, 200, etc.). But the church was hostile to the ordinary usages of the world only in so far as they were in conflict with the ideal of Christianity, which supplied a standard by which all actions in the economic sphere could be tested. Everything inconsistent with the profession of Christianity was condemned, and uncompromising obedience to its precepts was enjoined. The process of applying Christianity, in changing or widely differing social conditions, went on in the earlier centuries of the Christian era and throughout the middle ages. The work of the church was not so much to introduce new principles of action as to test those already known, assimilating those which were not hostile to Christianity, and giving them new significance when considered in the light of the Christian faith.

The pursuit of gain as an end in itself was obviously inconsistent with Christianity, and the condemnation of avarice in every form is one of the most striking characteristics of the teaching of the church. This may be regarded as the fundamental principle of mediæval economics. Its different parts are so closely interwoven with each other that we can without much difficulty reconstruct the whole system from any one of its elements. Closely bound up with the condemnation of avarice was hostility to many methods of acquiring wealth which have since been adopted by civilised communities, and chief amongst those forbidden methods was USURY (*q.v.*), the objection to which extended to all forms of investment for the sake of gain. But the general teaching of the church would have had comparatively little influence but for its wide and far-reaching application of the principle of association. The interests of the individual were subordinated to those of the community. The duty of helping those in need, and the brotherhood of all Christians, were insisted on. It was this side of the teaching of the church (see CHURCH, THE MEDIÆVAL, ECONOMIC INFLUENCE OF) which accelerated, if it did not initiate, the formation of gilds and other associations, and ultimately led to the creation of the elaborate system of the middle ages for the regulation of trade and the restraint of competition. Insistence also on a just or reasonable price for commodities, the approximate determination of which was easier in this early stage of industrial development than it would be in modern times, led to numerous laws framed with a view to realising that object. It may be noticed as evidence of the hold which mediæval doctrines obtained, that the expression "just price" (JUSTUM PRETIUM), interpreted to mean that price which most closely approximated to cost of production, was used as a synonym for "cost price" as late as the end of the 16th century.

(*Vide* R. RECORDE'S *Grounde of Artes*, 1543, frequently reprinted and edited by Dr. Dee, John Mellis, Robert Norton, and others.)

The early hostility of the church to usury was based on the biblical records and on the authoritative declarations of the Christian fathers and the councils. Had the church maintained its original attitude there can be no doubt that its influence would have seriously hampered economic development. It became impossible, however, to regard with hostility many of the new methods of acquiring wealth which appeared with the extension of trade and commerce, and thus began one of the most interesting movements of thought of the middle ages, viz. the adaptation of the principles of Christian teaching on the subject of lending and borrowing to the needs of a changing environment. This process begins about the twelfth century. The canonist writers, on the one hand, endeavoured to separate the essential from the non-essential elements of the doctrine of usury, and to apply it to mercantile transactions, strengthening their position by appeals to ARISTOTLE'S doctrine of the barrenness of money, the conception of *natural law*, and other arguments ; while, on the other hand, merchants and traders, anxious to escape the "censure of usury," appear to have been not unwilling to submit to decisions which, on the whole, did not seriously hamper freedom of investment. *Bonâ fide* credit agencies, bills of exchange, loans for trading purposes, the payment of interest whenever the lender could show that the loan would result in "certain gain lost" or "actual loss incurred," rent charges, partnership, loans on bottomry, and other expedients for securing a return for the investment of capital, were gradually approved by the canonist writers, and the outcome of the movement was that the doctrine of usury was stripped

of everything likely to prove an obstacle to the practice of ordinary business methods.

Such was the course of movement on the continent. But for the present we are only entitled to say that there was a general similarity between English and continental opinion during this period. No doubt many passages may be quoted from English statutes which appear to be suggested by the canon law. The influence of the church was great, and the trading classes would not lightly risk excommunication for the sake of gain. "Goods lost, nothing lost; credit lost, much lost; soul lost, all lost," is an old proverb; and even as late as 1486 Pope Sixtus IV. thought it worth while granting to the inhabitants of the Channel Islands "the help and authority of the church by interdict, anathema, and other forms of censure, for the repression of piracy, robbery, and violence" (*Materials for history of the reign of Henry VII.* (Rolls series) i. 280). The ordinary teaching of the church, whatever may have been its practice, was hostile to avarice and covetousness (*vide*, for example, the homily in *Ashm. MSS.* 750), and occasionally the influence of the GILDS (*q.v.*) may have been favourable to the rule of the CANON LAW (*q.v.*) [*Ordinances of the Gild of St. Leonard, Lynn*, Toulmin Smith's collection, p. 50]. The usury laws also were enforced and had the support of the trading classes (*Liber Albus*, ed. 1861, 318, 319, 339). But such evidence enables us to say only that there was a general similarity, which indeed we should expect, between England and the continent; and in the development of economic doctrine the points of difference are of equal if not of greater importance. The backwardness of investigation prevents us from dealing with the latter with any completeness of detail. The following, however, may be noted. Neither the canon law nor the civil law was received in England as authoritative "except educationally, and as furnishing scientific confirmation for empiric argument." (Stubbs, *Lectures on Mediæval and Modern History*, 307.) The canonists, however, claimed that "a suit might be brought in the ecclesiastical courts for every matter which was not cognisable in the courts of secular law, and for a great many matters which were so cognisable" (*ib.* 316), and there was a long conflict on the subject. The system of rent charges was not generally prevalent in England, and *montes pietatis* were never established (see MONT DE PIÉTÉ). An attempt to introduce the latter was made without success, by Gerard MALYNES, early in the 17th century (*Lex Mercatoria*, 1622). The economic legislation of the 14th and 15th centuries was largely empirical. In the regulation of foreign trade especially, and in the organisation of the customs, the measures adopted were mainly determined by the fiscal necessities of the government, and we can see very early the tendency to subordinate trade to the exigencies of foreign diplomacy (*e.g.* in the relations between England and Flanders) which became so prominent a feature of later commercial development. Councils of merchants were summoned by Edward I. and Edward III. to advise with them on questions of trade (see Rymer, *Foedera* (1821) vol. ii. pt. v. 1057). The general impression we get from a study of the legislation of this period and from such arguments as are recorded in the Rolls of Parliament, is that many of the measures adopted were tentative and experimental. To understand therefore the economic ideas of the time we must examine closely the statutes and institutions in which they were embodied. Such were the statutes regulating wages and prices, the organisation of the crafts, the staple system, restraints on the exportation of bullion, statutes of employment, and usury laws. We may notice the following points: (1) The movement of thought on the subject of usury was slower in England than on the continent. (2) Financial methods well known on the continent were not introduced into England until comparatively recent times. The discussion, therefore, of various credit agencies which did so much to modify continental opinion was scarcely possible in England. (3) The impression prevailed —with what reason it is unnecessary here to discuss—that the staple system, while imposing certain regulations on all merchants alike, was not unfavourable to freedom of enterprise. (4) Money, so far from being subject to the same laws as other commodities, was supposed to be essentially different from them. It was, in fact, not a commodity at all, but a *pledge, a medium of exchange*, circulating under the authority of the prince or commonwealth, its value determined solely by that authority. The first appearance of those forces which were destined to break up the mediæval system should be noted. In the reign of Richard II. we have the first navigation act; then the beginning of various trading companies, especially that of the merchant adventurers (see ADVENTURERS, MERCHANTS; NAVIGATION ACT).

We are now in a position to trace the subsequent development of economic doctrine in England. The reign of Henry VII. was of great importance in the economic history of the country, and its industrial and commercial progress very soon brought about far-reaching changes in economic ideas. From the middle of the 16th century onwards there were few years in which some book or pamphlet was not published on subjects of economic interest, and such works may be reckoned by thousands. It is difficult to draw a sharp line of division between economic and non-economic publications. We shall, however, keep as closely as possible to the main line of development of doctrine, and in a later section indicate the relation to it of other currents of thought.

English statesmen and writers in the middle

of the 16th century had to face the most difficult economic problems which could possibly be submitted to them. The mediæval system for the municipal control of trade was unsuitable for the regulation of the new economic forces which the extension of the domestic system, especially in the woollen industry, brought into operation. The decay of tillage, and the growth of enclosures, appeared to threaten the country with the evils of depopulation, as well as a great increase in poverty. The social changes induced by the reformation seemed to be equally momentous. In relation to foreign trade, the loss of Calais inflicted a death-blow on the staple system, and the withdrawal of the privileges of the Hanse merchants injured the interests of a section of English merchants, although it left the way clear for the development of a national foreign trade by the merchant adventurers. In the growth of industry and commerce these difficulties were inevitable. There must have been great disturbance and loss to some classes, but in time the country would have settled down to the new conditions. The evils, however, of the period of transition were aggravated by a currency problem of the first magnitude. The debasement of the coinage under Henry VIII. and Edward VI., coupled later on with the influx of the new silver from the American mines, led to a rise of prices without parallel in the history of the country. The evils of the debasement were felt especially by the landed interest, the government, and the working classes. It is important to keep these facts in mind, for they formed the subject-matter of the earliest economic literature. One treatise—the *Briefe Conceit of English Policy*, attributed to William Stafford, and published in 1581, but really written by John Hales about 1549 (*Eng. Hist. Review*, vi. 284)—deals with these questions as a whole, and sums up the aims of the government at this time. The writer shows a clear insight into the causes of the high prices; his work is invaluable as a storehouse of information, and in it we have a broad outline of the theory of the balance of trade, which was elaborated in the following years. The *Briefe Conceit*, however, scarcely enables us to trace distinctly the relation between the opinions which have already been described, and later economic doctrine. To do that we must go to the history of the merchant adventurers.

With the growth of their trade, the merchant adventurers naturally adopted means of avoiding the transmission of bullion, such as bills of exchange, which had long been in use for certain transactions. Until the middle of the 16th century all went well, but then the fluctuations in the ratio of exchange between London and Antwerp, and other places, brought into prominence the usurious aspects of bill discounting, and the opponents of the merchant adventurers attributed the rise in prices to their practices. It was commonly believed that it was within the power and the exclusive right of the government to fix the rate of exchange, and thus determine the prices of commodities. We cannot here detail the circumstances which gave rise to this theory. It must suffice to say that when it arose it was not altogether absurd; there was much in the ordinary practice of merchants to give some show of truth to the theory; and it was closely bound up with the doctrine of usury. From the middle of the 16th century until late in the 17th it was advocated in pamphlets, and pressed upon the attention of the government, which was really uncertain how to act. It was the basis of the charge of usury, which was one of the most usual arguments against the merchant adventurers (*vide* the *Treatise on Exchange*, 1564, printed in Milles's *Customers Replie*, 1604), and the economic world was divided into two opposite camps — the bullionists, represented by the advocates of the Staple System (*q.v.*), and the newer mercantile school represented by the merchant adventurers and their supporters. In his economic works, nine in number, though only five survive, Thomas Milles, head customer of Sandwich, undertook the defence of the staple system, and denounced the monopolising tendency of the merchant adventurers. In his *Customers Apology* (1601), we have a curious anticipation of Adam Smith's canons of taxation, and one of the earliest instances of the claim for free trade based upon the theory of natural rights (cp. Report from the Committee on the Free Trade Bills, 1604, *Journals of the House of Commons*, ii. 218-221. The monopoly of the merchant adventurers was "against the natural right and liberty of the subjects of England.") The attacks on the company called forth John Wheeler's *Treatise of Commerce* (1601). Wheeler was secretary to the merchant adventurers, and his statements are not free from bias and inaccuracy, but his book is a good defence of their policy and aims. Wheeler's reply to Milles provoked another attack from the latter, in the *Customers Replie* (1604), in which he added to the force of his own arguments by reprinting the *Treatise on Exchange in Merchandise and Merchandising Exchange* mentioned above. We need not, however, follow him through his other works. His mantle fell on Gerard Malynes, who was more moderate in his views, and had more knowledge and experience than Milles. Meanwhile, the East India Company had obtained their charter, and in it a clause allowing them to export bullion. In consequence of this, the controversy on the foreign exchanges, the brunt of which had been borne by the merchant adventurers, was turned against the East India Company. Matters were also complicated by the introduction of a new element into the discussion, viz. the relative advantages of joint-stock and regulated companies for

carrying on distant trade, the East India Company being an example of the former, and the merchant adventurers of the latter. It must also be pointed out that the state of trade in the reign of James I. caused, reasonably or unreasonably, much anxiety; and the currency, the privileges of the trading companies, the price of wool, the navigation acts, etc., formed from time to time the subject of government inquiry. We shall deal with these issues later on; they are mentioned now to show how impossible it becomes with the growing complexity of economic questions to separate the writers of this period into well-defined groups. Early in the reign of James I. there was some possibility of the revival of the old machinery for the regulation of the foreign exchanges. The controversy burst into new life in 1622. To meet the charges brought against the East India Company, Thomas MUN published, in 1621, his *Discourse of Trade from England to the East Indies*, which was devoted partly to showing the advantages of the exportation of bullion. It is interesting to notice, however, that as yet Mun had not entirely broken away from the old school, for in this work he approved of the statutes of employment. Edward MISSELDEN, for some time deputy governor of the merchant adventurers at Delft, had long devoted attention to the woollen trade, and in 1622 he published his *Free Trade, or the means to make Trade flourish*. In this work he discusses the reasons for the backwardness of the English cloth trade, and defends the company organisation. But for some cause he appears to have been not unwilling to disarm the opposition to the merchant adventurers and to turn it against the East India Company; and amongst the causes of the decay of trade he enumerates the exportation of bullion by the latter.

Now Malynes had already, in his earlier pamphlets, found a sufficient cause not only for depression of trade, but for all social evils, in the theory of the foreign exchanges which we have already noticed. To his mind the only remedy likely to prove efficacious was the revival of the staple system. Naturally, therefore, he thought Misselden completely mistaken in the causes to which he attributed the supposed decay of trade, and he approved of a joint-stock company for the East India trade. He therefore replied to Misselden in his *Maintenance of Free Trade* (1622), in which he reiterated his theory of the foreign exchanges. This pamphlet was almost immediately followed by his great folio *Lex Mercatoria*, in which he expressed the same views.

We may digress for a moment to point out that we probably owe to Malynes the introduction of the word "capital" into England. At the beginning of the 17th century this word was unknown, or at any rate not in use in England. In his *Lex Mercatoria*, Malynes endeavours to popularise the Italian and Dutch method of keeping accounts, and he describes the *capital* or *stock* of a merchant as consisting of the goods in his warehouse, his ready money, debts due to him, houses and lands in his possession, and his "plate, apparell, and household stuff." "Capital," as used by Malynes, was derived from *capitale*, very numerous instances of which may be given from continental treatises on mercantile law.

To return to the controversy of 1622, Malynes's work was not allowed to pass unquestioned. In 1623, Misselden replied in his *Circle of Commerce, or the Ballance of Trade*, in which he completely refuted Malynes's theory of the foreign exchanges, and, taking up the defence of the East India Company, pointed out the advantages of the exportation of bullion, and sketched the theory of the balance of trade. Malynes again replied, but his theory had been completely demolished. Thus the mercantilists not only arrived at a truer doctrine of international trade, but in doing so destroyed a theory with which the old views with regard to usury were closely bound up. In 1628 Thomas Mun further developed the argument for the exportation of bullion in the *Petition and Remonstrance of the East India Company*, which was republished in 1641. Meanwhile, Sir Ralph MADDISON had been devoting attention to the subject. He had sat, with Mun and others, on the royal commission of 1622, though for some reason his name was omitted on the reappointment of the commission in 1625. Under the commonwealth and the protectorate he was regarded as a great authority on currency questions. He gave a clear statement of the theory of the balance of trade in *England's looking in and out*, 1640, a work which was reprinted in 1641, and again, with a few verbal changes and additions, in 1655 under the title of *Great Britain's Remembrancer*. Maddison, however, holds a middle position between Malynes and Mun, for his views on currency and the foreign exchanges appear to be based upon the works of the former. Mun incorporated the arguments of the *Petition and Remonstrance* in *England's Treasure by Foreign Trade*, published in 1664, some years after his death, and this work became the chief bulwark of the mercantile system in England. It passed through many editions and exercised an influence almost incredible at the present time. Thus the great system of which we find the general outline in the *Briefe Conceit of English Policy* was furnished with an economic basis. But before we describe the principal characteristics of Mun's work, it is desirable to trace the development of the other lines of thought which his book brought to a focus.

The economic writers of the 16th and the 17th centuries agreed in maintaining that the unrestricted operation of the motive of self-

interest led to disorders in the state, and that an efficient system of industrial and trade organisation was necessary to direct the economic activities of the country into the right channels. They set before themselves a definite object, the "public good," by which they meant the creation of a "commonwealth," in which the various trading interests should be so balanced as to secure the greatest economic efficiency of the various elements consistent with the self-sufficiency of the nation as a whole; and considerable prominence is given to this idea as an "economic motive" in the works of the best writers. Thus Mun distinguishes between three sorts of gain, (i) that of the commonwealth, which was sometimes the merchant's loss; (ii) that of the merchant, "which he doth sometimes justly and worthily effect, although the commonwealth be a loser"; and (iii) that of the king, "whereof he is ever certain" (*England's Treasure*, etc., p. 64), but he had previously stated the rule that, in commerce, "private gain was ever to accompany the publique good" (*ib.* p. 3). The pursuit of the public good, interpreted in the sense given to it above, was a real force in the economic world, and the suppression of a trade "hurtful to the commonwealth" was generally approved. Taking the mercantile system at its best, it shows a distinct advance on mediæval ideas in the substitution of the wider interests of the nation for those of the craft or the municipality. On the other hand, it must be admitted that the majority of the writers show little or no consciousness of a high national aim. The "hurtful" trade generally happened to be that of a rival company, a dependency, or a neighbouring nation. The mercantilists differed too from the *laisser faire* school in the views they held on the relation of economic questions to religion, politics, and other subjects. Economic interests could not be isolated. Prosperity was the result of various economic, political, and religious forces mutually interdependent. Thus Sir William Temple remarks of Holland: "The trade of this country is discovered to be no effect of common contrivances, of natural dispositions or situation, or of trivial accidents, but of a great concurrence of circumstances," amongst which he enumerates the immigration of aliens, the constitution and credit of the government, liberty of conscience, security of life and property, and the interest of the people in their government, as well as causes of a more strictly economic character (*Observations upon the United Provinces*, Collected Works, 1723, i. 65). One of the mercantilist tests of economic prosperity separates them so sharply from more modern schools, that it deserves to rank as a fundamental principle of their teaching. This was the quantity of the precious metals which the country contained. A thorough examination of mercantile doctrines in relation to the circumstances of the time does not exonerate the writers from the charge of confusion of thought on this subject. There is no evidence that this led to any evils in the ordinary economic life of the community. But on foreign trade as a whole, and on the popular estimation in which different branches of foreign trade were held, it had enormous influence: "The ordinary means to increase our wealth and treasure," says Mun, "is by Forraign Trade, wherein we must ever observe this rule: to sell more to strangers yearly than we consume of theirs in value." The economic pamphlets of the period abound with similar statements. They certainly mean that the benefit of foreign trade is measured by the excess in value of exports over imports, and that branches of commerce which can not bear this test should be discouraged, or even suppressed altogether. Although there is no "historical justification" for this doctrine, we can see how it arose. We may dismiss the idea that the mercantilists thought "wealth" and "money" identical. No man could believe more firmly than Gerard Malynes in the necessity of securing a constant influx of bullion, yet we owe to him the first clear definition of capital in the English language. His book, bound up with Dafforne's *Merchants' Mirrour*, one of the most complete works on book-keeping then in existence, was very generally used as the chief authority on mercantile affairs. The strongest advocates of the theory of the balance of trade were successful business men. Mun was one of the ablest East India merchants of his time. There is no trace of any confusion of wealth with money in their business transactions, and they exported bullion like any other commodity. We must therefore seek some other explanation of the fallacy. Although the old bullionist theory of the foreign exchanges had been refuted, the writers of the 17th century could not free themselves from the conceptions on which it was based, and such works as Roberts's *Mappe of Commerce* (1638), or even Alexander Justice's *General Treatise of Monies and Exchanges* (1707), in which the ratios and methods of exchange between London and other trading centres are given in great detail, show that international transactions were still carried on in much the same manner as under the staple system. The king's Exchanger (*q.v.*) had disappeared, but the cambists and goldsmiths performed his functions with great profit to themselves. Communication between one country and another was slow and difficult; credit agencies were little developed; and in such circumstances the old view of the precious metals was not easily eradicated. It remained firmly fixed in the popular mind. It was more natural to regard the changes which lapse of time, expanding commerce, and the rise in prices had brought about, as modifications of an old theory, than to invent a new

and more accurate one. The strict analogy drawn by the writers of this period between the business transactions of an individual and the foreign commerce of the nation as a whole gave to the old theory a greater persistence. The fact that during the 17th century imports and exports were a fairly good test of international indebtedness had the same influence. It may also be pointed out that English imports consisted of a greater proportion of luxuries, such as spices, wines, silks, and fine linen, and a smaller proportion of necessaries and raw materials than at the present day, while bullion was indispensable for trade with the east, in the then backward state of English manufactures. So the mercantilists tried to keep down the importation of commodities which in their opinion sapped the vitality of the nation, and to secure the bullion which they required (see MERCANTILE SYSTEM).

We are now in a position to understand the attitude of the school of which Mun was the typical representative to the economic questions of the 16th and the 17th centuries. It is obvious that the mercantilists were not likely to take much theoretical interest in the finely-drawn distinctions of the canonist writers on the subject of usury. Theological influences were not strong in this country; and true to the English tradition, the mercantilists preferred expediency to metaphysics. It is probable that the views of the later canonists were never thoroughly popularised in England. During the reformation period there was much controversy, and towards the end of the 16th century many pamphlets were written, amongst which we may mention Nicholas SANDERS's *Briefe Treatise of Usury* (1568), Thomas WILSON's *Discourse of Usurie* (1569), Rogers's translations of the works of M. P. Cæsar and N. Hemming (1578), H. SMITH's *Examination of Usury* (1592), and Miles MOSSE's *Arraignment and Conviction of Usury* (1595). But the development of trade and commerce, which at an earlier period might have imparted great vitality to such discussions, took place subsequent to the reformation, and though the influence of the contending schools may be traced in the legislation of the period, English writers appear to have regarded the subject mainly as one of practical expediency. Malynes was indebted to Wilson's *Discourse* for some of his arguments and illustrations, but even those who were willing to prejudice the merchant adventurers by attributing their "usurious" practices to the influence of Rome, were on the whole hostile to the prohibition of usury. The doctrine was important only as a support to an erroneous theory of the foreign exchanges, and, with the refutation of the latter, interest in the former disappeared. The CULPEPERS, father and son, Thomas Manley, and other writers from time to time engaged in the controversy. The average English position is stated in Sir J. CHILD's *Brief observations concerning Trade and the interest of Money* (1668). In *The Interest of Money mistaken, or a treatise proving that the Abatement of Interest is the Effect and not the Cause of the Riches of a Nation*, published in the same year, an attempt is made to correct a current popular fallacy. Mun's view was the ordinary view of the time; favourable to usury, he held that "this course in the rich giveth opportunity presently to the younger and poorer merchants to rise in the world, and to enlarge their dealings; to the performance whereof, if they want means of their own, they may and do take it up at interest: so that our money lies not dead; it is still traded" . . . "usury and trade rise and fall together" (*England's Treasure*, etc. 144, 146). With the views of LOCKE and the other writers of the end of the 17th century we shall deal in a later section.

While the theoretical discussion of interest and usury attracted few writers, the constitution of the trading companies assumed great importance in economic controversy. This was inevitable, for at the beginning of the reign of James I. the whole of the foreign trade of the country except that carried on with France was monopolised by one or another of the companies, and they were one of the most important factors in economic development from the beginning of the 16th to the middle of the 18th century. During the period which we are now considering, viz. from the beginning of the 16th century until the publication of Mun's work (1664), there were, roughly speaking, two stages in the controversy on this subject. In the first stage the Merchant Adventurers Company was the most powerful of the associations then in existence. The controversy naturally took the form of a struggle between the merchant adventurers and those who looked for a solution of the great problem of the organisation of foreign commerce to a revival in some form of the staple system. The first stage may be said to terminate with the free-trade bills of 1604, to which reference has already been made. After the failure of these bills the position of the companies was assured, although hostility to them in one form or another is a most marked feature of 17th century history, and Cromwell tried the experiment of a free and open trade with the East Indies in 1653. The case for the merchant adventurers is stated with great moderation in an anonymous treatise, *Towchinge the Multitude of Marchantes for ventinge of Eng. clothes* (*Rawl. MSS.*, D. 23). After pointing out that the government should provide for only so many merchants "as have acquaintance, and as have polycy and understandinge to trade together to buy up all clothes vendyble for marchant venturers, and to carry them together, by one consorte of Marchants, unto one certen marte," the writer goes on to say:

"I do also suppose yt it is not profytable for the realme to have a multytude of Marchante Venterers, yt have but small stockes, and thereby they have but small credytt, and suche marchantes can not convenyently tary for theyre sales, nor yet keepe necessarye order." The opponents of the companies, as we have seen, claimed free trade as their natural right and inheritance, but "this generall lybertye . . . would cause a greate confusion, and a greate dysorder to growe in the ventyng of Englyshe clothes, whereby would follow yt or Englyshe clothes would be soulde at a lower pryce, then is fytte for the benefytte of or realme, and strange wares for England would be boughte at a dearer pryce than is convenyent for our commonweale of Englande." On the other side the arguments, in addition to the one mentioned above, were very strong. It was urged that freedom of trade would lead to the increase of wealth and shipping, the more equal distribution of wealth, and the increase of revenue. It was further maintained that the company organisation was no longer necessary, and that if trade were free, commerce might be extended beyond its present limits.

The growth of the East India Company, which was incorporated on the last day of the 16th century, led to the second stage of the controversy. The merchant adventurers were what was called a regulated company; the East India Company was organised on the joint-stock principle (*vide* Companies). Now many people who objected to monopoly in every form were of opinion that the former was less injurious to trade than the latter, and the East India Company had a long and arduous struggle before it won the victory. The conflict had to be waged with the Turkey Company, whose trade in raw silk was ruined by the enterprise of the East India merchants, with those who were alarmed at the exportation of bullion, with the free traders and interlopers, and with those who thought the East India trade disastrous to the growth of the navy. The last-mentioned cause of hostility gave rise to a sharp controversy between Sir Dudley Digges and an anonymous writer, J. R., in 1615. "The East India men," says the latter, "not able to furnish those places they resort to, keep out others from coming amongst them. . . . Besides, how tedious and costly they, and all other companies, make it to their own associates, whereas out of orders, and cause of upholding their trade, men can neither dispose of their own as they would nor have the benefit under a long time? How private do they and other companies make it when . . . how plentifully soever the commodities are brought in and at what advantage soever they buy them, they will be sure to keep up the price, either by sending most part of the commodities abroad, or else by buying all others into their hands?"

Digges's reply, *The Defence of Trade*, on behalf of the company, probably derived more force from the position of the author than from the arguments he employed. The company of course could point to the fact that the prices of eastern produce had fallen since their incorporation, and they made as much as possible of this argument, which was further elaborated by Mun in his *Discourse of Trade to the East Indies* (2nd ed. 1623). The company and its advocates, however, appear to have evaded rather than answered the objections of their opponents. No one during the 17th century wanted freedom of trade in the modern sense of the words. It was universally recognised that some form of regulation was necessary, and most people would have chosen the company organisation. The object of the free-trade bills (1604) was not to break down all restraints on free competition, but to throw the companies open to all who cared to join them, imposing by government authority such charges as were necessary to keep up their official establishments in foreign ports. It was the monopoly of the companies which roused the hostility of the outsiders. The companies seem to have imagined that when they had shown the advantages of the trades they monopolised, and proved the necessity for regulation, they had answered their opponents. Mun wrote *England's Treasure* long before the end of the struggle. But his book did good service to the company. Their exportation of bullion could no longer be urged as a reasonable ground of objection, and the East India trade had been proved to be favourable to the growth of the navy.

It has become a commonplace to regard the navigation acts as the natural outcome of mercantile doctrine. The political circumstances of the time, the growth of foreign commerce, and along with it the necessity of providing adequate means for its defence, and the foundation of colonies, showed the great importance of a powerful navy. The economic writers of the period were naturally influenced by the general movement, and they urged the encouragement of trades, especially the fisheries, which were favourable to the growth of the navy. The vast increase in the wealth of the country, and the greater ease with which large sums can be raised by taxation, have made inapplicable to the present age the practical suggestions of the mercantilist writers. But the importance of a mercantile marine as a naval reserve is felt as keenly now, especially in times of danger, as in the period under discussion. The economic arguments, however, by which the navigation acts were defended, give to those measures a peculiar character. There were navigation acts in the reign of Richard II. Those, however, we need not discuss. It is the series of acts commencing in the reign of Elizabeth, and culminating in the great act of

the Long Parliament (1651), re-enacted at the restoration, to which we shall devote our attention (*vide* NAVIGATION ACTS). The Merchant Adventurers Company, which as we have seen played such an important part in the development of the mercantile system, early associated itself with this naval policy. Thus we find them advocating it in 1551. One of their *Articles and Allegations . . . against the Hanse Merchants* (*Rawl. MSS.* C. 394, ff. 37, 38) was to the effect that whereas they "have and by all waies do indevoure themself to supporte and maignteigne to their power, the whole Nâvie of this your Ma^tes realme, by fraightinge and ladinge of the same and to contynue a greate nomber of your Ma^tes subjects in maroners crafte: the said Esterlinges to the intollerable decay therof, both inwardes and also outwardes do contynuelly lade, fraight and shippe their goodes, wares and marchandises in foreyne and strange bottomes, and vessells." They then point out the loss to the country of the money paid for freight and insurance. This is an argument which recurs over and over again, and it is evident that the writers of the period attached great importance to it. Mun argues that we must "use our own shipping and so get the merchant's gains, insurance and freight," though generally speaking "commerce should be free to strangers to bring in and carry out at their pleasure" (*England's Treasure*, p. 22). The influence of the navigation acts was made the subject of government inquiry, and much attention was given to the subject throughout the 17th century. *The Advocate* (1651), which was published to allay the discontent caused amongst some classes by the act of 1651, and which we find reflected later on in the writings of Roger COKE, shows how these acts were regarded as part of a general scheme of economic policy. This work points out that it was the design of the Dutch "to engross universal trade that so they might poiz the affairs of any other state about them and make their own considerable." The advantages which Holland has over England are then enumerated. Their ships are built, provisioned, and convoyed at less cost than those of England. Their "cheapness of freight," which is an advantage of 20, 15, and 10 per cent over England, has forced English merchants to hire and freight Dutch ships. They employ a "great stock"; give "prudent care to their manufactures"; make the negotiation of commercial treaties their "interest of state"; impose small customs; encourage inventions; have a low rate of interest; facilitate their trade by a bank; and pursue an enlightened land policy. Some "unalterable laws in manufactures" are enunciated. (1) There is no manufacture or artificial commodity which cannot be transplanted into any country. (2) All manufactures, if they are of a certain goodness, are of a certain value and price also. (3) Two persons selling or making commodities of a like goodness, he shall have the preference of the market that will sell them the cheapest. And so in international trade. (4) The cheapness of manufactures and artificial commodities depends upon the plenty and cheapness of the raw material, and upon the price of labour. The price of labour depends upon the price of victuals, house-rent, and other things necessary. The Dutch have no extraordinary advantages over England. Such as they are, they are due to the carelessness of England. By trade alone can wealth and shipping be increased, and so the power of any nation sustained. A commonwealth can only be enriched by reducing into general practice the courses used by private men for that purpose. Hence England should encourage native manufactures; and weaken Dutch shipping. Commodities must be imported from the immediate places of their production or growth, or as near as conveniently may be. Exports, native or other commodities, must be sent to the farthest market, where they will yield the greatest price and have the quickest sale. After these reasons, it is hoped that little or no dissatisfaction with the navigation acts will remain.

The examples we have given show the manner in which the mercantilists approached the questions of their time, and it is unnecessary to trace in detail the economic policy which found expression in the corn laws and bounties, in the commercial treaties, and the foundation of colonies. We have said "policy," for the mercantile system was a collection of practical expedients, based indeed on the fundamental principles we have noticed, but never elaborated into a scientific economic system. Such was the state of economic thought when Mun's book was published, and we can now understand the popularity with which it was received. As a scientific work it has no merit whatever. But it appealed to a very strong and growing sentiment, and put into words what most people believed at the time of its publication. Mun's work, with its sequel the *British Merchant*, the name given to the series of papers written in opposition to DE FOE'S *Mercator*, during the controversy on the free-trade clauses of the Treaty of Utrecht (1713), gives the best idea of mercantilism as an economic system. But before the time of its greatest influence forces had been set in operation which ultimately overthrew it, and we must now briefly sketch this movement.

We have already seen the character of the early opposition to the trading companies, and the appeals to natural right as the basis of free trade. The companies won the victory, for in the relation of the government to trade, and the unsettled state of the countries to which the companies traded, their organisation was neces-

sary, and they included amongst their numbers the wealthiest and most influential of the merchants. The outsiders on the other hand were weak and disunited. But with the extension of commerce the number and influence of the latter grew; and it became clear that the exclusive privileges of the companies were an anomaly. The great statute of monopolies (1625) was a step towards freedom of trade; for although many of the evils complained of remained unchecked, it established the principle that none should monopolise for private gain what was the equal right of all English citizens; and it restricted the royal prerogative in the regulation of trade. The agitation against the trading companies was not without important results, for the most powerful of them, the East India Company, was reorganised on a broad national basis (1692-1702). In the 18th century we find little discussion of a subject which had been of such importance in the century before, and Tucker's pamphlet on the Turkey Company (*Reflections on the expediency of opening the trade to Turkey*, 1753) only expressed what was true of all the companies then in existence. It is doubtful whether at this time they were a serious restriction on trade, but they had performed the useful functions they once had, and it was absurd to continue their privileges. In other directions also, *e.g.* in Walpole's colonial policy, and the decay of the Elizabethan system for the regulation of wages and industry, we can see a movement towards free trade.

Meanwhile the theory of natural right was shattering the philosophical basis on which the mercantile system rested. The instances we have given from the history of the trading companies may probably be referred to popular sentiment, or to conceptions derived from English common law. At any rate, the latter was appealed to in the Commons debates of 1601 (Townshend's *Historical Memorials;* D'Ewes's *Journals.*) But the theory grew in influence and the range of subjects to which it was applied; and the levellers claimed universal suffrage and other measures as the natural right of all men (*Clarke Papers*, edited by C. H. Firth for the Camden Society, Introduction). Economic and popular sentiment coalesced with the philosophical movement, and with the development of the theory of the social contract the way was paved for an individualist system of political economy. Philosophical conceptions, however, derived from this source, had little or no influence on economic theory until the time of HUME. HOBBES and Locke took the economic ideas of their age as they found them ready made by the pamphleteers of the 17th century, and merely stated them with greater clearness. During the period with which we have to deal, the economic is of greater importance than the philosophical movement. The attempt to deal with the practical difficulties of the 17th and the 18th centuries supplied those fundamental economic conceptions without which the science could have made no progress.

We have seen that one of the chief sources of error in the works of the mercantilist writers was their confusion of thought on the nature and functions of money. The foundation of the Bank of England (1694) and the recoinage (1696) called forth an immense number of pamphlets dealing directly or indirectly with this subject. It is from this period that we can date the theoretical discussion of economic questions, and the attempt to work out a scientific system. English writers had discussed continental banks many years before the foundation of the Bank of England. We may mention, for example, the *Treatise on Exchange* (1564), to which reference has already been made. In works intended for the guidance of merchants, such as Malynes's *Lex Mercatoria* (1622) and Lewis Roberts' *Merchants Mappe of Commerce* (1638), it was natural that the writers should explain so important a feature of continental practice. The superiority of the Dutch was, as we have seen, partly attributed to their banking system, and during the 17th century the advisability of adopting it in England was frequently urged upon the government (*e.g.* Hugh Morrell to William Lenthall, ii. Jan. 1646-47, *Portland MSS.*, vol. i. p. 405). Generally the establishment of a bank was advocated in pamphlets in which its advantages were discussed. Amongst these we may mention Thomas Violet's *Advancement of Merchandise*, 1651; Sir Ralph Maddison's *Great Britain's Remembrancer*, 1655; Samuel LAMBE's *Seasonable Observations*, 1657; W. POTTER's *Tradesman's Jewel*, 1659; Francis CRADOCKE's *Wealth Discovered*, 1661; Sir Edward FORD's *Experimental Proposals*, etc. 1666, etc., which show that for some years before the great experiment people's minds were much occupied with the subject. As these proposals took a more definite shape the number of books published became larger. The banking question was associated with the coinage, the public debt, and general questions of trade and commerce. Sir Dudley NORTH, Sir William PETTY, John LOCKE, Nicholas BARBON, Michael GODFREY, William LOWNDES, William PATERSON, Robert MURRAY, John ASGILL, Simon CLEMENT, are some among the many names which may be found in English controversy during these years. One pamphlet followed another with such rapidity, and discussion was so general, that it is difficult to single out any one author as the representative of the others. North's *Discourses* (1691), however, should be noticed, and the works of N. BARBON show a deeper insight into economics than those of his contemporaries. Locke's *Considerations of the Lowering of Interest and Raising the Value of Money* (1691), followed by his *Further Con-*

siderations (1695), not only refuted the arguments advanced by William Lowndes and others, in favour of his scheme for restoring the coinage, and so saved the country from a great disaster, but contributed much that was of permanent value in economic science. In spite of these merits, however, Locke was strongly under the influence of the mercantile doctrine. The great controversy of 1691 to 1696 finally disposed of the theory of money which underlaid the mercantile system, and the relaxation of its influence was now only a question of time. The persistence of an old theory, long after its refutation, is a common phenomenon in the history of human thought. While the discussion of currency, banking, and credit undermined the theoretical framework of the mercantile system, and the growth of statistics threw doubt upon the balance of trade as a test of economic prosperity, the accumulation of capital and the development of commerce were removing the conditions of which the mercantile system was partly the reflex. During the first fifty years of the 18th century economic progress was slow. Defoe indeed in his *Mercator* had urged a principle which would have led to important results if it had been acted upon. He recommended no less than the *isolation* of economic questions. "Gain is the desire of merchandise: trade is a commutation of merchantable commodities between one country and another, and for the mutual profit of the traders. The language of nations one to another is, *I let thee gain by me, that I may gain by thee* . . . Trading is a matter entirely independent in its nature, and neither consults other interests, nor depends on any interests, but what relate to itself" (*Mercator*, No. 21). But it was the *British Merchant* and not *Mercator* that was sent to every parliamentary borough for the use of the inhabitants.

Why is it, we may ask, that for so great a length of time little progress in economic science has to be recorded? Certainly it was not due to lack of interest in economic subjects. There seems to have been no difficulty in obtaining a hearing. There are literally hundreds of economic writers in England between 1500 and 1752, and every trade crisis or controversy produced its score or so of pamphlets. The reasons for the slow growth of the science seem to have been as follows:—(1) With few exceptions the economic works of this period were written merely to advocate some definite object,—to urge the adoption of some scheme for the improvement of trade, to defend those whose interests were threatened by new developments, *e.g.* the numerous pamphlets on the East India Company, and their relations with the Levant Company, or to protest against some abuse and to suggest a remedy, *e.g.* the pamphlets on the poor laws, the coinage, public credit, etc. This close relation between economic literature and the practical life of the nation was unfavourable to the development of a system of economic doctrine. Mun (*England's Treasure by Foreign Trade*, 1664) expressly states that his work was not intended as an exhaustive and systematic treatise on the economics of the 17th century. He proposed to discuss only "so much of the merchant's practice as concerned the bringing of treasure into the kingdom." (2) Such being the objects of the writers, there is a strong bias in most of them in favour of the organisation or project with which they happened to be identified. The biographies of the earlier writers are therefore of importance, for their personal relations with hostile organisations or individuals, and events in their lives, affected their views to a great extent. (3) When once a controversy was concluded, no one endeavoured to develop and apply the general principles which may have been stated in the course of it. Thus the currency controversy in 1694, and the defence of the East India Company, led to a statement of the main outlines of the principle of the division of labour (Simon Clement; *Discourse of General Notions*, etc., 1695; *Considerations on the East India Company*, etc.). Other writers such as Petty, Berkeley, Addison, etc., also enunciate this principle. But it lay unregarded until Adam Smith made it one of the fundamental principles of the *Wealth of Nations*. (4) The early writers had to depend, for the most part, on their own knowledge and experience to suggest or illustrate their arguments; trustworthy information on economic subjects was neither so copious nor so widely diffused as it is at the present time. Sir William Petty, John Graunt, Gregory King, and Charles Davenant, who laid the foundations of statistical science, all lived in the latter half of the 17th century. So late as 1699 Davenant complains (*Essays on Trade*), that "the aids and lights which might be gathered from the public accompts and offices have been industriously withheld from all who are not servile applauders of the wild and destructive conduct . . . of some persons of no small power in the management of affairs." He and Gregory King are "beginners of an art not yet polished, and which time may bring to more perfection." (5) The early writers employed in their works the language of ordinary business. They had no scientific terminology. Now the language of the market-place is not characterised by scientific precision, and their looseness of phrase gave rise to endless misunderstanding.

The point of view from which early economic literature should be regarded becomes therefore quite clear. It must be studied along with the history of the times at which it was written. This must be carefully borne in mind, or we shall form an erroneous estimate of the value of these early works and the ability of the writers.

We must not expect a uniformity, consistency, and completeness of doctrine and practice which are not to be found. Nothing could be more fatal to the right appreciation of this period than to investigate it with the idea that we shall find in it only illustrations of a well-rounded set of general propositions.

[Much has been written on the history of economics. *Vide* especially Ashley, *Economic History*, vol. i. pts. i. and ii.—Cunningham, *English Industry and Commerce.*—Endemann, *Die Nationalökonomischen Grundsätze der Canonistischen Lehre.*—Hewins, *English Trade and Finance.*—Heyking, *Handelsbilanztheorie.*—Knies, *Politische Œkonomie.*—Roscher, *Geschichte der Nationalökonomik in Deutschland.*—*Political Economy* (trans. Lalor), *Geschichte der englischen Volkswirtschaftslehre.*—Schanz, *Englische Handelspolitik.*] W. A. S. H.

ENGLISH SCHOOL OF POLITICAL ECONOMY.

Before Adam Smith, p. 730; Modern Economics, p. 733.

BEFORE ADAM SMITH.—The English writers on political economy before Adam Smith do not at any time present the marks of a "school," properly so called. The nearest approach to a "school," so far as community of doctrine is concerned, is found among the mercantilists; but even these writers owe no allegiance to any personal authority. Their views are individual and independent; and it is only with Adam Smith that the English school *par excellence* begins. The rise of that school was affected by many influences, English and foreign. Of these the genesis of economic theory in England must be sought chiefly through the writings of the authors whose names are mentioned in the rapidly-connected sketch which follows.

There is much that is of interest not only to the economic historian but also to the student of economic theory in the early statutes and the records of the social history of England, but few English writers earlier than the 17th century call for special mention in this article. Langland, in his *Visions of Piers the Plowman* (14th century), and the writer of the *Libell of Englishe Policye* (15th century) incidentally supply some interesting illustrations of the course of life in England during those periods. The writings of WALTER OF HENLEY (13th century), FITZHERBERT (16th century), and TUSSER'S *Five hundreth pointes of good husbandrie* (Tottel's edition, 1573), throw light on the state of agriculture and the condition of the people. "W.S." (see HALES, JOHN) in his *Discourse of the Common Weal of this Realm of England* (written 1549, printed 1581), acutely discusses the contemporary depression of agriculture and industry. His attempts to show that the "alteration of the coyne is the cheifest and principall cause of this universall dearthe" are highly interesting examples of early economic argument and analysis. More's *Utopia*, 1518, imbued as it is with the ideas of classical antiquity, has more affinity with the *Republic* of Plato than with the industrial utopias of later writers. The chief impetus to the publication of *Discourses upon Trade*, was afforded by the problems of policy in colonial trade by which the commercial activity of the English people, following upon the enterprise of navigators and adventurers, found itself confronted. This is noticeable as early as the essays of BACON, 1597 ("Of Plantations"), and the writings of RALEIGH. From the incorporation of the East India Company, 1600, there is a continuous succession of writers on the theory of foreign trade which formed the kernel of the old MERCANTILE SYSTEM. The mercantile school may indeed be said to continue its existence in quite different forms from this time to the days of STEUART. The traffic in the precious metals naturally attracted the attention of statesmen and of merchants alike; and from the reign of Edward III. onward, attempts were made to regulate its exchange for imported commodities. The inevitable export of bullion for the East India trade found an ingenious apologist in MUN, who, in his *Discourse of Trade from England into the East Indies*, 1621, and *England's Treasure by Forraign Trade*, published 1664, shifted the ground of the BALANCE OF TRADE from the position which it holds in the writings of ARMSTRONG (1530) and MALYNES (1601). He argued that this export, like the seed cast away by the husbandman, was in the long run amply repaid in kind, and that the raw material which the precious metals purchased, when worked up and sold to foreign countries, caused the national stock of bullion to be increased and not diminished. "The title of Mun's book, *England's Treasure in Foreign Trade*, became a fundamental maxim in the political economy, not of England only, but of all other commercial countries" (*Wealth of Nations*, bk. iv. ch. i.). Malynes, *The Canker of England's Commonwealth*, 1601, and *Lex Mercatoria*, 1622, describes the Ancient Law Merchant as well as the contemporary habits and institutions of trade; and LEWES ROBERTS, *Merchants Mappe of Commerce*, 1638, *Treasure of Trafficke*, 1641, explains the operations of commerce, and recommends practical measures,—*e.g.* free export of gold and silver, and low customs,—for its promotion. His *Mappe of Commerce* is a mercantile geography, showing the situation, exchanges, and commodities of trade of different places. MISSELDEN (*Free Trade*, 1622, *Circle of Commerce*, 1623) exhibits the Spaniards as warnings, the Dutch as models in mercantile policy, and disputes with Malynes the causes and consequences of an unfavourable balance of trade. The example of the low rate of interest in Holland further stimulated the CULPEPERS, father and son, to urge the reduction by parliament of the legal rate of interest—a demand supported with much weight by

CHILD (1668), whose business instincts, superior to his scientific theory, were probably not at fault when he supposed such a measure would redound to the encouragement of English commerce. The unsoundness of some of the arguments which he employs was pointed out in *The Interest of Money Mistaken*, 1668.

Passing by the utopia of HARRINGTON (*Oceana*, 1658), and such agricultural writings as those of Blith, *The English Improver Improved*, 1652, HARTLIB, *Legacy of Husbandry*, 1655, WORLIDGE, *Systema Agriculturae*, 1668, and John SMITH, *England's Improvement Revived*, 1670, we come to the speculations of HOBBES, 1670, and ASGILL, 1696, on the nature and causes of wealth. Particular recommendations for the improvement of trade by the naturalisation of aliens, and in favour of the policy of enclosures, are found in FORTREY, *England's Interest and Improvement*, 1663, and COKE, 1671. Fortrey's statement that the country "lost" £1,600,000 a year by its trade with France, long had a discouraging effect. The despondent tone of most writers of this time is echoed in the title of *Britannia Languens*, 1680, and in the arguments of its pseudonymous author (Philanglus), that the importation of foreign luxuries was a "consumptive trade" which threatened to bring about the decay of the nation while money was exported for them. The same writer urges the "legal regulation" of trade, to prevent its destruction by "private interest" and by the "cloggs" of navigation acts, companies, monopolies, etc. Similar views with regard to the eastern trade are found in POLLEXFEN'S *England and East India Inconsistent in their Manufactures*, 1697—a reply to DAVENANT'S *Essay on the East Indian Trade*, 1696-97. A more hopeful note is struck in *England's Great Happiness: wherein it is demonstrated that a great part of our Complaints are Causeless*, 1677, and in the optimistic preface of PETTY'S *Political Arithmetic*, 1682, which opposed to vain imaginings and timid surmises the positive conclusions of comparative statistics, and drily observed that the price of food was "so reasonable, as that men refuse to have it cheaper, by admitting of *Irish* cattle." The best thought of the time had now for many years been directed into the channels of trade, and produced, as was natural, an abundant crop of pamphlet literature on all questions connected with "the Science of the Great Commerce." Comparative study of other nations, especially of France, Holland, and Spain, was one main source of the inspiration of these writings, and numerous proposals sprung up for establishing banks (see ASGILL, BRISCOE, CARY, CHAMBERLAIN, CRADOCKE, LEWIS, MURRAY, PATERSON) and for emulating Holland in other matters. This spirit is shown in YARRANTON'S *England's Improvement by Sea and Land: To outdo the Dutch without fighting*, etc. (pt. i. 1677; pt. ii. 1681), in Sir Wm. TEMPLE'S *Observations on the Netherlands*, 1693, and in the popularity of the translations of "John de WITT'S" *True Interest and Political Maxims of Holland*, 1702, etc. (see DUTCH SCHOOL).

An important epoch is marked by GRAUNT'S *Natural and Political Observations upon the Bills of Mortality*, 1662, with which begins the science of DEMOGRAPHY, as statistics, and the theory of taxation may be said to commence with Graunt's more famous friend Sir Wm. Petty, whose remarkable treatises on *Taxes and Contributions*, 1662, *Political Arithmetic*, 1682, and the *Political Anatomy of Ireland*, 1691, exhibit an ingenuity of method and grasp of principle rarely if ever shown by his predecessors. The first table of mortality was published by HALLEY in 1693. DAVENANT (1699) and GREGORY KING (in 1696) continued the work of statistics (see ARITHMETIC, POLITICAL); while the current views on the balance of trade found an able opponent in BARBON (1690), who was soon to cross swords with LOCKE on the subject of money.

The proposals of LOWNDES, then secretary to the treasury (1695), to coin the new (silver) money lighter, provoked the opposition of Locke, whose able writings on money at this critical period of the great recoinage (see RECOINAGES) are still appealed to in controversies of to-day upon the history of the currency. The earlier work of VAUGHAN, *Discourse of Coin and Coinage*, 1675, should also be mentioned here. Mingled with the discussions of semi-political questions by earlier authors are many glimpses of a broader consistent theory, general principles of which now begin more clearly to emerge. The close of the 17th century is indeed a time conspicuous for the ability of English economic writers. Barbon's *Discourse of Trade*, 1690, contains some striking analyses of value, price, interest, and rent. NORTH'S *Discourse of Trade*, 1691, is an admirable exposition of the merits of free exchange. FLEETWOOD'S *Sermons against Clipping and Sweating of the Precious Metals*, 1694, precede by thirteen years his *Chronicon Preciosum* or history of prices, familiar to students of Adam Smith. The problem of the conditions of the poor which had fitfully occupied statesmen since the date of Richard II., in whose reign the earliest legislation for dealing with impotent beggars took place, seriously engaged the attention of FIRMIN (1678), HALE (1683), Child (who proposed the appointment of poor-law guardians or "fathers of the poor"), Cary (1695) and BELLERS, *Proposals for Raising a Colledge of Industry of all Useful Trades*, etc. 1695-1696. From DEFOE'S lively and prolific pen came, in 1704, the vigorous essay, *Giving Alms no Charity and Employing the Poor a Grievance to the Nation*, in which it was contended that workhouse labour should not be employed in competition with outside industry. The same writer's *Compleat English Tradesman*, 1725-27,

and *Plan of the English Commerce*, 1728, are the chief of his other numerous works on subjects relating to trade. John HOUGHTON, F.R.S., *Collection for the Improvement of Husbandry and Trade*, 1692-1703 (particulars of prices of corn, cattle, coal, hops, wool, etc.); *The British Merchant; or Commerce Preserved*, 1713 (papers collected and published by Charles KING, 1721); and Defoe's *Mercator, or Commerce Revived*, 1713, 1714 (an opposition paper to *The British Merchant*), afford useful details for the history of commerce.

LAW'S *Money and Trade considered*, 1705, exhibits at once the power and the defects of his erratic genius; original, daring, and acute, he admits no limit to the bounds of credit, and has little thought of its contraction. His book marks, however, a real advance in the study of money and credit. WOOD'S *Survey of Trade*, 1718, also deals with money and bullion. MADOX is an invaluable source of information for the economic historian in his *Antiquities of the Exchequer*, 1711, and *Firma Burgi*, 1726. In Ireland appeared about the same time the well-known *Drapier's Letters*, 1725, in which SWIFT inflamed the anger of his countrymen against Wood's copper halfpence; DOBBS' essay on "The Trade and Improvement of Ireland," 1729-31; and BERKELEY'S *Querist*, 1735, a collection of searching and suggestive inquiries in economics, revealing at once the author's mind and the degree of development which the science had then attained. Swift's *Modest Proposal for preventing the Children of Poor People from being a burden to their Parents or the Country*, 1730, is an elaborate joke framed in a tone of ironical and pseudo-economic savagery. GEE'S *Trade and Navigation of Great Britain considered*, 1729, is a despondent treatise of mercantilism, affecting to show "that the surest way for a nation to increase in riches is to prevent the importation of such foreign commodities as may be raised at home." VANDERLINT'S *Money Answers all Things*, 1734, on the other hand ably argues for free trade, while MANDEVILLE'S *Fable of the Bees, or Private Vices, Publick Benefits*, 1706, 1714, 1723, etc., urges the social advantages of individual liberty. Both books mark a movement in the direction of LAISSEZ-FAIRE. DECKER'S *Proposals*, 1743, for raising the whole revenue by a single tax on houses, and the *Essay on the Causes of the Decline of the Foreign Trade*, 1744, show much ingenuity in the study of taxation. John SMITH'S *Chronicon Rusticum Commerciale*, or *Memoirs on Wool*, 1747, is an industrious compilation of standard value upon this great branch in the history of English trade. Equally laborious but less praiseworthy are the *Dictionaries of Trade and Commerce* of POSTLETHWAYT (1751), ROLT (1761), and MORTIMER (1766). Postlethwayt's, the best of the three, was founded mainly upon the French dictionary of SAVARY. In 1751 and 1753 appeared translations from the Spanish of USTARITZ and ULLOA of the history of trade in Spain, and in 1753 a translation from the German of MAGENS' *Universal Merchant* (postscript 1756). The last two writers are mentioned by Adam Smith. FRANKLIN'S *Observations concerning the Increase of Mankind*, 1751; HUME'S essay of "The Populousness of Ancient Nations" in his *Political Essays*, 1752; and WALLACE'S *Dissertation on the Numbers of Mankind in Ancient and Modern Times*, 1753, show an interest in the progress of population, its causes and limits, nearly half a century before MALTHUS. The middle of the 18th century recalls the end of the 17th by the fertile ability of its economic writers. Hume's *Essays* contributed powerfully to the development of sounder views on money and the balance of trade. Wallace, in his *Characteristics*, 1758, discusses the functions of paper money and credit. The essays of Patrick Lord ELIBANK, on *The Public Debt* were published in the same year (1753) as FIELDING'S *Proposal for making an Effectual Provision for the Poor*. The most important writings appearing at this time were, however, those of CANTILLON, MASSIE, and TUCKER.

Cantillon's posthumous *Essai* (published 1755) is the earliest approach to a complete presentation of economic principles, tracing the distribution of wealth by the guiding thread of a central theory of value. Its influence was greatly felt in the FRENCH SCHOOL, but is also clearly seen in the *Essay on Money and Coins* of HARRIS (1755-58). Massie (see *infra*), though best known by his criticisms of Decker's and FAUQUIER'S proposals in taxation and by his *Essay on the Governing Causes of the Natural Rate of Interest* (1750), has been shown by Dr. Cunningham to have left a bibliography of economic literature of the highest value (*Economic Journal*, vol. i. No. 1). Tucker (see *infra*), dean of Gloucester, is remarkable for the breadth and liberality of view with which he regards the economic aspect of colonial and foreign politics. Tucker accepted with pride the sarcasm of Warburton, that he made a religion of trade as other ecclesiastics had been known to make a trade of religion. The dignity of economic study did not much longer need vindication. His *Reflections on the Expediency of a Law for the Naturalisation of Foreign Protestants*, 1751, were translated into French by Turgot (1755). His *Brief Essay on the Advantages and Disadvantages which respectively attend France and Great Britain with regard to Trade*, 1750, is said by BLANQUI to show the influence upon Tucker of the French economists with whom he was in close correspondence. But there can be little doubt that in their relations with Tucker at this time they were rather disciples than masters.

The high esteem in which the early English writings was held abroad was no doubt largely

due to the superiority of English commerce which gave them birth. It was felt with justice that a nation of successful merchants were worth listening to on matters of trade. The French in particular richly repaid their debt to us through Adam SMITH, upon whose mind they impressed their systematic and logical views; but it should not be forgotten that those views were largely founded on the practical judgments of English writers. Nor can the diligent student of the *Wealth of Nations* fail to be struck by the extent to which that work is rooted upon the earlier English writings. And though in the crucible of Adam Smith's mind the materials of his predecessors are often refined, they still do not defy recognition, but testify to the close continuity of the English school.

It has not been possible in this slight account to do more than enumerate some of the writers who preceded Adam Smith. For fuller notices the student is referred to the separate articles under the names of the authors. Contemporaries of Adam Smith are dealt with in a later portion of this article. It is only necessary to mention as appearing before 1776, the *Three Tracts on the Corn Trade and Corn Laws*, 1758, by Charles SMITH, whom Adam Smith has described as "ingenious and well-informed"; the important *Inquiry into the Principles of Political Economy* of STEUART, 1767 (see *infra*); ANDERSON'S *History of Commerce*, 1764; FERGUSON'S *History of Civil Society*, 1767; PRICE on *Reversionary Payments*, 1769, and on the *National Debt*, 1774; and Arthur YOUNG'S *Farmer's Letters*, 1771, *Rural Economy*, 1773, and *Political Arithmetic*, 1774, with some of his earlier *Tours* in the English counties. H. H.

MODERN ECONOMICS. PERIOD I. ADAM SMITH.—After the Union of 1707, Scotland began to play a part in English economic study. Francis HUTCHESON (professor of moral philosophy at Glasgow, died 1747) turned the attention of Scottish philosophers to economic questions, on which he himself touches, though briefly, in his published works (*e.g.* in his *Inquiry into the Original of our Ideas of Beauty and Virtue*, etc., 1st ed. 1725). The notion of the "greatest happiness of the greatest number" appears in Hutcheson, and he also lays stress on the connection between industry and self-interest, industry and property, thus carrying on the discussion raised by Mandeville (*Fable of the Bees*, etc., 1706, and later eds.), on the nature of the motives to economic action. The activity of the Scotch press (Foulis, Urie, etc.) in the publication and reprinting of economic treatises becomes noticeable about this time (say 1750 to 1770). Adam FERGUSON in the 4th ed. of his *History of Civil Society* (1773), announced the forthcoming work of Adam Smith, which was to be "a complete theory of national œconomy"; but Ferguson's own economical views (*e.g.* on division of labour) are given incidentally along with his political philosophy, and not in a separate treatise. In his *Institutes of Moral Philosophy* (1769), where he treats of economical questions, he borrows to some extent from Joseph HARRIS (*Essay on Money and Coins*, 1757). To much greater effect David HUME, who had learned from Hutcheson, had prepared the way for his friend Adam Smith by his keen criticism of the current views of the balance of trade, to say nothing of his pregnant remarks on the other subjects embraced by the "Mercantile Theory" (*Essays on Commerce, Money, Interest*, etc., 1752). Economical subjects receive separate consideration, and Hume's reasonings upon currency, credit, and population were of special influence. In the controversy as to the populousness of ancient nations he took the side of the moderns. In the matter of public credit, or national debts, he took the view that national debt would eventually prove the ruin of modern nations. He points out that the quantity of metallic money in a country does not determine the rate of interest, also that a time of increasing currency is a time of lively trade. He thinks that commercial jealousy rests on a false idea that one party must always be the loser, in a bargain. He goes, if not as far as Adam Smith, nearly as far as Josiah Tucker (*Advantages and Disadvantages which respectively attend France and Great Britain with regard to Trade*, 1750). But it was left to Sir James Steuart and Adam Smith to recognise for their own country what had already been made good by the physiocrats in France (see PHYSIOCRATS and FRENCH SCHOOL), that economical subjects must be a study by themselves. Sir James Steuart's book (*An Inquiry into the Principles of Political Economy, being an Essay on the Science of Domestic Policy in Free Nations*), written in exile in Germany, and first published (in Edinburgh) in 1767, made no impression on the public to be compared with that of Adam Smith's *Inquiry into the Nature and Causes of the Wealth of Nations* (1776); and was rather a revised edition of the mercantile theory than a new departure. The immediate popularity of Adam Smith's work, on the other hand, was largely due to its crushing criticisms (especially in .bk. iv.) of the "commercial system," which was tracked out and destroyed in all its logical ramifications, however tenaciously it might afterwards survive in political practice. The idea of "natural liberty" organising industry, and transforming society "of its own accord," was stated by Adam Smith even more boldly than by the French economists, and he avoided their mistake of restricting productiveness to agriculture (bks. iv. ix.) In his chapters "On the Revenue of the Sovereign or Commonwealth" (bk. v.), he came out as "the greatest of theorists on finance" (Bastable); and no economical treatise ever exerted greater political influence.

On economic theory its influence has been also very great, though it was not so immediately visible, and is now partly spent. The definition of wealth, the discussions on labour, wages, rent, interest, and the short remarks on value, served as starting-points for more thorough and satisfactory consideration of these matters. Adam Smith's method of reasoning, though frequently deductive, involves so full an illustration from facts and statistics, where such were accessible, that he has often been claimed as an inductive economist. The industrial changes then taking place in England gave his treatise a peculiar historical importance, if they were not indeed responsible for its creation. Similarly, if we pass by Bentham's correction of one false concession in "the Wealth of Nations" (see BENTHAM), the next contribution to English political economy was largely occasioned by a change in the condition of the people.

PERIOD II. MALTHUS AND RICARDO.—The poor law of W. PITT, proposing a bounty on large families, and the popularity of Godwin's political theories, led MALTHUS to bring forward in his *Essay on Population*, 1798, a clear-cut theory of "the principle of population." He inquired into the nature and causes of poverty, as Adam Smith into those of wealth. The tendency of population to increase up to the limits of the means of subsistence was brought out more strongly than the checks on this tendency, which were not adequately stated till the book had emerged from the floods of criticism into a second edition (1803). The views of Malthus on general economic theory were not elaborated with such perfect lucidity as his doctrine of population; he tended either to fall back on physiocratic views, or to theorise, as on the measure of value and the corn laws, with a subtlety inconsistent with clearness. He maintained views on overproduction which brought on him the damaging criticisms of J. B. SAY. On the other hand, he shares with JAMES ANDERSON, and Sir E. WEST, the credit of first stating what is usually called the Ricardian theory of agricultural rent, that rent is the effect not the cause of price, and that it depends on the graduated fertility of lands. RICARDO, who first obtained fame by his *Letters on the High Price of Gold Bullion* (1809), and made an enduring mark on the theory of currency, owes his prominence in economic literature to his *Principles of Political Economy and Taxation* (1817). In this book he pushed the theory of rent farther than its discoverers, and made it, together with a new theory of value, the centre of a theory of the distribution of wealth between the three parties concerned in its production—the labourers, the employers, and the landlords. The value of manufactured articles is determined mainly by the quantity of labour necessary to the production of them, and of agricultural products by the quantity of labour necessary to the cultivation of the worst land actually cultivated. The height of this "margin," to use the phrase of Dr. CHALMERS, determines the amount of profits to the employers, and the amount of rent to the owners of all land above the worst. Ricardo's qualifications of this theory were neither numerous enough nor clearly enough stated; and, even if the theory had not been reproduced, as by M'CULLOCH, without the qualifications, a reaction against Ricardian political economy could be only a matter of time. But it held the field for nearly a generation after the publication of the *Principles*. It found popularisers both humble and eminent (Mrs. MARCET and DE QUINCEY): James MILL followed it wholly, and SENIOR with reservations that seemed in those days unimportant, though in after times the acuteness of Senior has been better recognised. TORRENS did not succeed in establishing his claims to independent authority, nor did Chalmers restore the authority of Malthus. WHATELY, LONGFIELD, LAWSON wrote clearly but without making any decidedly new departure. Professor Richard JONES, in appealing against Ricardo to the history of India, was before his time. The minor writers (see below) left fruitful hints, but made few converts among students of the subject. Robert OWEN and his followers gained little hearing in the world of letters. The victory of FREE TRADE (1846), the passing of the early FACTORY ACTS, the rise of CHARTISM, and the regulation of the paper currency (see BANKING), affected the course of economic discussions; and the French Revolution of 1848 played a part in England as well as on the Continent French and German writers began to acquire greater influence than ever before.

PERIOD III. JOHN STUART MILL.—Their influence was shown in John Stuart Mill's *Political Economy* (1848). This book was an attempt to combine abstract economical theory with the modifications necessary for its application in the concrete, and to view the whole of economics in relation to other parts of the philosophy of society. As Mill went beyond Bentham in his ethics, he went beyond Ricardo in his economics. Long before this time Mill had, like SENIOR, given attention to the question of method, which was afterwards to become an object of lively discussion.

The study of COMTE and other foreign writers had led Mill to doubt whether abstract theory was allowable at all in social inquiry. He retained it, however, for political economy; and in his chief economic book the abstract theory is presented, along with the modifications, being little more than a careful re-statement of Ricardian principles. He had wished to do for his own day what Adam Smith had done for his (see preface to Mill's *Political Economy*); and the influence of his book was so great that it seemed as if a new departure had

been taken and a new era begun. But Mill was so far from overthrowing the old doctrines that he really strengthened their hold at a time when it had been loosened. Yet, by his emphasis on the relativity of abstract economics to particular societies, and on the possibility of far-reaching changes in the social system, he showed an affinity with "historical economists," and "scientific socialists." The former found their earliest representatives in Cliffe LESLIE and Thorold ROGERS; and their views are now energetically advocated by Ingram, Cunningham, and Ashley. The CHRISTIAN SOCIALISM (of MAURICE, KINGSLEY, LUDLOW, NEALE, Hughes) grew out of Owen and Chartism; and its upholders, in advocating co-operative production, appealed rather to philanthropy and human brotherhood than to cool economic theory. The scientific socialism of MARX, avowedly based on the Ricardian theory of value, can hardly be said to have representatives in this country among professed economists. In his views of Land Reform, Mill (like his father), approached very near to socialism; but his attitude to socialism as a general policy is quite as truly critical as sympathetic.

PERIOD IV. W. S. JEVONS.—This cool reception of scientific socialism is mainly due to the rejection, by Jevons and his closest followers, or the serious modification, by Marshall and Sidgwick, of the Ricardian theory of value. The ideas of Jevons have had greater power since his death than during his life. He was too impatient at the almost universal submission to Mill's authority to do Mill complete justice. But he was one of the first critics of Mill who attracted general attention at all; and, since his time, there has been less submission to authority of any kind. There has no doubt been a line of writers who follow the elder school very straitly (FAWCETT, CAIRNES, MALLET) as among statesmen there has been a line of supporters of the old economic policy identified with BRIGHT and COBDEN. But changed conditions have forced most leading statesmen to go beyond *laissez-faire;* and new aspects of old problems have led theoretical economists into deeper study of particular questions (*e.g.* CONSUMPTION) than before. The mathematical treatment of economical data has practically fallen into the hands of a wing of the school of final utility, which is often spoken of as a school by itself, the mathematical school (Edgeworth, Wicksteed). Amongst the many writers who have taken part in discussions on currency and banking, Mr. H. D. Macleod has fallen back on WHATELY'S view that economics is simply catallactics, Bonamy PRICE has professed to represent unaided common sense, BAGEHOT has insisted on the need of formulating deductive economics for "advanced" nations, and on the impossibility of doing so for uncivilised peoples. Bagehot's lucid writings on banking and depreciation helped to keep these questions before the minds of economists; and the fall of silver since 1870 has made bimetallism versus monometallism an object of lively debate. The dominant view among professed economists after Jevons seems to be that bimetallism under certain conditions is possible, but that the conditions are difficult of fulfilment. The question has been discussed in close connection with the subject of the metallic reserves of our English banks, and, in this as well as other connections, the wisdom of the Bank Charter Act of 1844 is not now upheld by the majority of economists. A large part of the recent work of economists in England has been the restatement of the older doctrines, with the fresh light afforded by the theory of value laid down in 1871 by Jevons in this country, and substantially one with the theory of the AUSTRIAN SCHOOL OF ECONOMISTS. In connection with this, there has been practically a new theory of wages and profits, towards which not only Jevons but Walker has contributed very essentially. The idea of a wages fund, as held by Ricardo's immediate successors, and till 1869 by J. S. Mill, has been abandoned as Longe and W. T. THORNTON had foretold. The distinction of interest from profits—capitalist from employer, has been better kept in view—largely owing to the writings of Walker. The application to wages, interest, profits, and even taxation, of the idea of final utility has been pursued vigorously. Probably at no time have questions of economic theory ever been more ardently discussed in England than at present; and these discussions have hope of greater fruitfulness than before, because conducted now (*a*) with a much more adequate knowledge of what is written and said, about the subjects concerned, on the Continent of Europe, and in the United States of America, and (*b*) with a closer regard to the facts of everyday life, as the touchstone of all theories. Economists are more conscious than at any previous time of the importance of statistics for the understanding of the phenomena of society. They are also more keenly aware, partly from the influence of CARLYLE and Ruskin, of their need of contact and sympathy with men and associations of men in the surrounding world, though they keep in mind the distinction of an economic theory from a mere record of facts or a mere utterance of philanthropic aspiration.

Even in this short sketch it would be wrong to omit mention of the minor writers and amateur economists. Every great industrial or financial change, besides awaking a corresponding movement of speculation among professed economists, has been reflected in the fugitive literature of the day; and there has often been a subordinate movement of social, political, and economic theory, apparently quite aside from the path of the classical economists. The

writings of the agriculturist, Arthur YOUNG, and the financier and politician, Richard PRICE, had a certain influence on economical study. In the dark days of the French War the writings of William GODWIN may be said to have given the first impulse to the socialistic speculations afterwards carried out by Charles HALL, Robert OWEN, EDMONDS, GRAY, J. F. BRAY, and William THOMPSON. With Thomas SPENCE begins the movement for the nationalising of the land, countenanced in theory at least by James Mill, and advocated in later times by DOVE, George, and A. R. Wallace. The books of PAINE include not only deistic and political utterances, but useful admonitions in regard to paper currency in the early days of the suspension of cash payments. Ld. LIVERPOOL'S *Coins of the Realm* (1805), with the mass of pamphlets (see *e.g.* H. THORNTON, Lord KING, Boyd, BARING, BOSANQUET, HUSKISSON, TROTTER) called forth by suspension and by the Bullion report, form a considerable literature, in the face of which (and often by the aid of it) the theories of economists like Ricardo shaped themselves. Such books as Thomas TOOKE'S *History of Prices*, ably continued by NEWMARCH, and in a less degree COLQUHOUN'S book on the *Resources of the British Empire*, and (later) PORTER'S on the *Progress of the Nation*, helped to point economists to the more ample use of statistics; and this service is now rendered by writers like Guy, Rawson, Palgrave, Booth, Giffen, and others in the journal of the "Royal Statistical Society" (founded 1834).

The "refutations" of Malthus on population proceeded from all sorts and conditions of men. Many men of the stamp of COBBETT and Perronet THOMPSON took up every economic controversy that had a conspicuous political side. The new Corn Law of 1815 gave birth to a multitude of pamphlets and books on the corn laws, and eventually, after HUSKISSON'S reforms, to the movement that took shape in the ANTI-CORN LAW LEAGUE, and was kept up vigorously by the MANCHESTER SCHOOL of Free Traders. Concurrently with this movement and later in its political victory came the agitation for extension of the FACTORY ACTS, with a literature of its own. The discussions in regard to emigration (see SELKIRK) and (later) colonisation (see TORRENS, WAKEFIELD, and HILL-BURTON) as well as in regard to the reform of the poor law, produced not only small tracts but large volumes in which economists still find useful materials. The value of English blue books on such topics can hardly be over-estimated, and since the establishment of a labour department (1893) their usefulness in this particular field may be expected to increase. Where economic policy has touched closely the business of the City, as in the Bank Charter Act, the repeal of protective duties, and the repeal of the navigation act, commercial men have taken the lead in the composition of pamphlets contending for or against particular measures by the aid, as a rule, of a popular political economy. Yet on such matters as banking and the foreign exchanges such pamphlets have not unfrequently achieved a permanent place in classical economic literature.

The great development in the last half century of organisation among the working classes has led to considerable modifications of economic theory (see WAGES FUND). This organisation has shown itself most notably: (1) in trades unions and other benefit societies among skilled labourers; (2) in co-operative societies for sale of goods. The former are federated somewhat loosely in the trades union congress, the latter very compactly in the co-operative union. Hitherto co-operative production in the sense of partnerships of workmen has not advanced rapidly. The latest phases of the organisation of the working classes are: (1) the growth of trades societies among women, and especially (2) the "new unionism," which has two chief features (*a*) the organisation of unskilled labourers, (*b*) the policy of united action by all the organised groups when the interest of perhaps only one is at stake. These movements have undoubtedly influenced politics in the direction of greater interference by the state than was contemplated by our forefathers.

Indications that political economy has not lost its attractiveness for the English mind may be seen in the foundation of the British Economic Association (1890), its organ the *Econ. Journal* (1891), and indeed in the present *Dictionary*. The *Econ. Review* (1891) covers partly the same ground, though not so strictly economic as the *Econ. Journal*. The Cobden Club is still on the watch against protection and over-interference of the state. The Statistical Society has a journal coeval with the society, embodying its transactions, with much other valuable matter. The *Economist*, under the editorship of such men as Wilson, Bagehot, and Palgrave, has done valuable service in presenting clear, vigorous, and solid economic argument on questions of the day. With the *Statist* it represents on the whole the views of the economists of the City. The *Banker's Magazine* does the same for the world of bankers. Many papers of a strictly economical character (especially those of Jevons and Giffen) have been published in journals like the *Contemporary Review*, not addressed to professional economists but to the educated public generally. It is to be regretted that fugitive economic literature, whether in pamphlets or articles, has not yet found its historian; J. R. M'Culloch attempted the work in his *Literature of Political Economy* (1845), with a fair measure of success.

The series of volumes edited by M'Culloch (printed for the Political Economy Club and Lord Overstone), in some degree supplement his work, at least for the early part of the period above treated; their titles are: *A Select Collection of Scarce and Valuable Tracts on Money*, London, printed for the Political Economy Club, 1856.—*A Select Collection of Early English Tracts on Commerce*, London, printed for the Political Economy Club, 1856.—*A Select Collection of Scarce and Valuable*

Tracts and other Publications on Paper Currency and Banking, printed by Lord Overstone, London, 1857.—*A Select Collection of Scarce and Valuable Tracts and other Publications on the National Debt and the Sinking Fund*, printed by Lord Overstone, London, 1857.—*A Select Collection of Scarce and Valuable Tracts on Commerce*, printed by Lord Overstone, London, 1859.—*A Select Collection of Scarce and Valuable Economical Tracts*, printed by Lord Overstone, London, 1859.—*The Evidence given by Lord Overstone before the Select Committee of the House of Commons of 1857 on Bank Acts*, London, Longman, Brown and Co., 1857.—*Tracts and other Publications on Metallic and Paper Currency, by the Right Hon. Lord Overstone*, London, Longman, Brown and Co., 1858.

[In addition to M'Culloch's *Literature* there may be consulted:—Prof. Travers Twiss, *View of the Progress of Political Economy in Europe since the 16th century* (1847).—Prof. Adolf Held, *Zwei Bücher zur Socialen Geschichte Englands* (1881, especially bk. i., *Sociale und politische Literatur von 1776 bis 1832*).—Prof. J. K. Ingram, *A History of Political Economy* (from *Encycl. Britann.*) (1887).—Prof. H. S. Foxwell, "The Economic Movement in England" (*Harvard Quarterly Journal of Economics*, vol. ii. 1887).—L. L. Price, *A Short History of Political Economy in England from Adam Smith to Toynbee* (1891).—Prof. L. Cossa, *Introduzione allo studio dell' economia politica* (1892). English translation (L. Dyer), 1893.—Prof. Wm. Cunningham, *Growth of English Industry and Commerce*, and list of authorities *ad finem* (1892).—For financial history, Prof. C. F. Bastable, *Public Finance* (1892); Prof. E. R. A. Seligman, *Incidence of Taxation* (1892).—Anton Menger, *Das Recht auf den vollen Arbeitsertrag in geschichtlicher Darstellung*, 2nd edition, 1891, good for early part of the century and history of English socialism.—Karl Marx, *Das Kapital*, 2nd edition, 1879, good for history of factory legislation and for references to the minor economic literature. The *Political Economy* of Dugald Stewart (2 vols., ed. Sir Wm. Hamilton, 1855) is a mine of references to the pamphlet literature of the end of last century. E. Bonar, *Philosophy and Political Economy* (1893).—Schulze Gävernitz, *Zum Socialen Frieden* (1890). J. B.

ENGROSSING. See FORESTALLERS and REGRATORS.

ENREGISTREMENT, Fr. One of the principal divisions of the French finances, consisting of a registration duty on all deeds and documents, including notarial acts, judgments, contracts, sales, leases, indentures, wills, insurance policies, loans, articles of association, successions, transfers of property by gift or sale, etc. The duties are fixed or proportional—fixed for deeds not involving any pecuniary obligation; proportional when applied to acts stipulating a money consideration or a mutation of property. The registration dues produced in 1891 £27,600,000 independently of £6,640,000 for stamp duty. The proportional duty ranges from 12½ centimes to 10f. 80c. per 100 fr., the highest rate being for legacies or gifts from strangers in blood. The registration dues have been frequently criticised for their exaggeration. M. Leroy Beaulieu describes them in his *Traité de la Science des Finances*, with the stamp duty superadded, as frequently occurs, as a fiscal brigandage. He admits the utility of registration as a record of transactions in case of loss of the original deeds, but adds that the tax is only justifiable provided that it is of moderate amount, whereas as it is established in France it frequently becomes a confiscation of private fortunes by the state. The duty for gifts *inter vivos* is substantially the same as for successions after decease; that on sales of real estate is 6f. 60c. per 100 fr., and the effect of this heavy charge is to restrict the free circulation of such property. T. L.

[*Code annoté de l'enregistrement et du timbre, par* Dalloz et Vergé, Paris, 1878.—*Annuaire de l'administration de l'enregistrement*, P. Dupont.]

ENSENADA, ZENON DE SOMODEVILLA Y BENGOECHEA, Marquis de la (1702-1782), died in Medina del Campo. Belonging to a noble but poor family, he joined the naval service as commissary at the age of eighteen, and through his personal merit rapidly rose to the highest rank; he made an immense fortune and received his title of marquis in 1736 from the Infante Don Carlos, afterwards Charles III. of Spain, then king of the two Sicilies.

In 1743 he was appointed at the same time secretary of state for the navy, war, the Indies, and finance, although he expressly declared that "he did not know one word of the latter subject." He remained in power until his fall in 1754.

Ensenada was one of the most efficient finance ministers of Spain, and in 1751 he informed the king that "all the requirements of the state were met," an assertion which no Spanish minister had been able to make since the accession of the house of Austria in the 16th century. Under his enlightened administration, the ordinary revenue rose in a few years from 211 to 360 millions of *reales* (say from 21 to 36 millions sterling), although he contrived to alleviate the pressure of the enormous and vexatious taxation which oppressed the lower classes of the population. He put an end to the scandalous exactions of the farmers of the *rentas reales* (royal taxes), and he deprived them completely of collecting the *rentas provinciales*, which he put under the direct administration of the crown. Looking on precious metals as ordinary commodities, he allowed the exportation of silver, subject to a duty of 3½ per cent when drawn from Spain and of 6 per cent when drawn from America. He established *registros* or register ships, which were allowed to trade with America, independently of the *flota* and galleons. The flota was the annual fleet between Spain and her American colonies, the galleons were the

trading vessels escorted by the fleet. He formed the design of doing away with the *millones* or numerous minor excise taxes and tolls which weighed on every transaction of daily life, and of compensating the resulting deficiency by a better management of the customs and of the excise on salt and tobacco, and by establishing in Castile the *unica contribucion* or single tax, which was to be of 4 per cent on every species of income and property. It had been suggested for more than a century by the majority of Spanish economic writers and introduced into Catalonia in 1729. The preliminary survey or *catastro* was begun under his direction. Ensenada also abolished the internal duties, which interfered with the transport of corn from one province to another, and improved the means of internal communication. The royal navy, military ports, and arsenals were the object of his incessant and successful exertions, which were extended to almost every branch of government.

Ensenada's views and plans are explained in clear and straightforward language in the *Representaciones*, which he submitted to King Ferdinand VI., and which have been given in full for the first time in Don Antonio Villa's excellent biographical essay (*El Marques de Ensenada*, Madrid, 1878). One of them, written in 1751, will be found, although not quite complete, in the *Semanario Erudito* of Valladares (Madrid, 1788, vol. xii. p. 260), and in French in the French translation of Coxe's *Memoirs of Spain under the Bourbon Kings*, published by Andres Muriel in Paris in 1827 (*L'Espagne sous les rois de la Maison de Bourbon*, vol. iv. p. 282). Coxe gives a very favourable account of the internal administration of Ensenada (ch. liv.); which will be discussed in a special notice by Count Fernan Nuñez in his *Vida de Carlos III.*, now (1892) in the press. E. Ca.

ENTAIL, Law of. An entail is defined by Wharton (*Law Lexicon*) as "an estate settled with regard to the rule of its descent." The object of legislators in recognising entails has been to preserve estates undiminished in the hands of successive generations of the same family. This fixity of landed property was essential to feudalism, which based the political rights and duties as well as the social consideration of each individual on his relation to the land. Feudal law, therefore, regulated the disposition and devolution of land less with reference to the wishes of the owner or to the increase of the riches of the community, than with reference to the permanence and efficiency of the feudal organisation. Feelings of family pride deepened by feudal ideas contributed in turn to perpetuate the system of entails which had fostered them. But in the main the system of entails is a political institution.

In one form or another the system of entails may be traced in every country where feudalism established itself. In many of those countries it disappeared in the series of political changes which opened with the French Revolution. In England, however, it has survived, but with many modifications which have almost destroyed its identity. The English law relating to entails may be considered under three heads:

I. The doctrine of "estates" in land; II. the practice of making settlements of land; III. the modifications recently made in the law relating to land.

I. The unity of ownership, so prominent in Roman law, is almost lost in the feudal land law. In England land is not technically an object of private ownership, since the crown is supreme lord of all the land of England. Private persons can only have *estates*, *i.e.* interests more or less extensive in land. Many different persons may have estates or interests in the same piece of land. In freehold land there are three different estates: (*a*) estate in fee simple, (*b*) estate tail, (*c*) estate for life. Estate in fee simple or an estate *to a man and his heirs* is practically, although not technically, the same thing as full ownership. The tenant in fee simple has the fullest power of enjoying and disposing of the land. An estate tail is an estate to *a man and the heirs of his body*, *i.e.* to a man and his descendants. It may be an estate in tail male, *i.e.* descending only to male offspring, or an estate in tail female, *i.e.* descending only to female offspring, or an estate in tail special, *i.e.* descending only to offspring by a particular wife. But estates in tail special, are, in practice, very uncommon. When the offspring of the tenant in tail are all deceased, the estate tail is at an end and the land reverts to the grantor of the estate tail or to his representative. Thus an estate tail is a smaller interest in the land carved out of the fee simple estate. When there is an estate tail in one party there must be a reversion in fee in another party. An estate given to a man and the heirs of his body was at first regarded as a fee simple estate given conditionally upon the birth of issue. When the tenant had issue he acquired the right of alienating so as to defeat the rights of his heirs and also of the reversioner. By the statute De Donis Conditionalibus (13 Ed. I. c. 1), the power of alienation was entirely taken away. But within two centuries the lawyers invented methods of evading the statute, namely, the collusive actions known as Fines or Recoveries, whereby the tenant in tail could once more alienate his land, and defeat the rights of heirs and reversioners. By the Act for the Abolition of Fines and Recoveries (3 & 4 Will. IV. c. 74), these actions were superseded and the tenant in tail was enabled to attain the same object by simply executing a deed to that effect and having it enrolled in

a public office. Thus a tenant in tail can turn his estate tail into an estate in fee simple, and acquire virtually unrestricted ownership. An estate for life does not descend to offspring of the tenant, and cannot be enlarged so as to extinguish the rights of the reversioner. The position of the tenant for life at common law, and previously to certain modern statutes, was that of a usufructuary, who might enjoy the income, but might not change the character, much less impair the capital value, of the property. Thus he could not open mines, fell timber, or plough up old meadow land. Nor could he dispose of the land by way of gift, sale, or exchange, or lease it for more than a very limited period. He has been recently invested with very wide powers which will be explained later on.

II. The settlements of real estate in use date from the 17th century. When a landowner executes a settlement, he usually reserves a life estate to himself and gives an estate in tail to his eldest son with remainders in tail to his other sons. The eldest son, when born, acquires an estate in tail to take effect after his father's death. Such a future estate in tail cannot be barred without the consent of the tenant for life, who is called the protector. If the son held out till his father's death, he would become tenant in tail in possession, and then could bar the entail and get an estate in fee simple. But whilst his father lives he has nothing. Therefore, when he wants an establishment of his own, he has every reason to join with his father in making a new settlement similar to the old one. Thus the perpetuation of an estate in the same family is ensured. But the powers of a tenant for life at common law were not enough even for the proper management of an estate. In every well-drawn settlement there were appointed trustees, invested with powers of selling, exchanging, or leasing parts of the estate and of executing permanent improvements and charging the estate with the cost thereof. These powers the trustees were to exercise only with the consent of the tenant for life and with a view to the interest of all persons entitled under the settlement.

III. The modifications recently made in the law amount to bestowing upon the tenant for life powers similar to those bestowed upon the trustees by the settlement. A series of statutes of the present reign ending with the Settled Land Act of 1882 has annexed to the character of tenant for life the fullest powers of alienating the whole or parts of the estate, and of employing the proceeds either to buy other land or to pay off encumbrances on the fee simple, or to make permanent improvements, or to invest in certain specified securities. The tenant for life now combines two totally distinct characters: his former character of usufructuary, and his new character of trustee for all parties (himself included) who have an interest under the settlement. The settled estate is now to be regarded not so much as land, but as capital which happens to be invested in land, but may be invested otherwise at the discretion of the tenant for life. It remains to notice the objections made by economists against systems of entail generally, and to consider how far they are applicable to the system of entails now existing in England. These objections are principally two: I. entails check the improvement of land; II. entails restrict the transfer of land.

I. Entails check the improvement of land, and so lessen the wealth of the community; because the limited owner, as compared with the absolute owner, has (*a*) less motive to improve and (*b*) less power of improving. (*a*) The limited owner has less motive to improve his land, because he cannot dispose of it by sale or testament, and because the property will all go to one son, without affording a provision for the other children. Hence the limited owner is exposed to the temptation of desiring to apply the whole income of the land, either to his own purposes or to making a provision for daughters and younger sons. The English tenant for life cannot now be deprived of the power of selling his land, but he can touch only the income of the proceeds. This objection, therefore, is lessened rather than removed by recent legislation. (*b*) The limited owner lacks power to improve the land, because (i) his freedom of action has been narrowly regulated by law. (ii) His land may have been encumbered with charges created in favour of other members of his family, which lessen the net income; (iii) he has to make provision for children other than the heir, and is thus further straitened.

(i) The English tenant for life (see Settled Land Act, 1882), has now the legal right to do almost anything which the tenant in fee simple could do. His means for permanent improvement are now much greater than they were formerly, since he can sell part of his land in order to raise capital for improving the rest. He can do this without impoverishing his younger children, as the land which he sells would under the settlement have gone to the eldest son. (ii) The charges on the land to provide a jointure for the widow of the late tenant for life, and portions for the younger brothers and the sisters, are not affected by recent legislation. They form deductions from the gross income of the tenant for life, and lessen his means of improvement. (iii) The tenant for life still has to provide for his younger children, and may thus be tempted to set apart for them money which might with advantage be spent on improving the land. Recent legislation, therefore, whilst much enlarging the powers of improvement possessed by a tenant for life, has

not put him upon an equality in this respect with the tenant in fee simple.

II. It is said that a system of entail deprives landowners of (*a*) the power, (*b*) the motive to sell their land, and thus produces the following evils:—(i) the retention of land in the hands of persons who may be too impoverished to improve it; (ii) the exclusion of capital from being employed in the improvement of land which under a system of free sale would be purchased by capitalists; (iii) a restriction in the number of landowners, which diminishes the stability of society; and (iv) the removal of a strong motive to industry and economy in the labouring class, namely, the hope of becoming the owner of a piece of land.

That the power to sell is wanting, under a complete system of entail, is clear. That it is not wanting under the modified system of entail now existing in England is also clear. The motive to sell is still wanting to the tenant for life, in so far as he cannot appropriate the capital sum paid by the purchaser. But, since his income is much reduced by prior charges, and by the necessity of saving for children other than the heir, he has the strongest inducement to exchange an investment like land, which at the present day rarely pays more than 2 per cent, for investments like railway debentures, which pay 3 per cent. For the increase of return all goes to swell his income, the charges upon it remaining the same.

Under the Settled Land Act, a good deal of land has been sold in England. But hitherto land has been offered for sale mostly in large masses. For this there are several reasons:—(i) the influence of habit upon those who conduct the sale of land; (ii) the extravagant expenses connected with making out a title, which may be as heavy for a small piece of ground as for a large estate, and so act as a prohibitory tax on sales of small parcels; (iii) the present condition of the market for agricultural produce which represses any strong desire, in the English middle or lower class, to become freeholders. Energetic persons engaged in agriculture prefer to employ their capital in working a large farm rather than in buying a small one. Other small capitalists dislike so risky and unproductive an investment as land is at the present time. For all these reasons the estates which have come into the market have generally been bought undivided by wealthy men who can afford to place great sums in a sort of property which gives social consideration and out-of-door amusement, but yields only a paltry return in money. Thus the sales which have taken place in England are not believed to have much increased the number of landowners. In Wales, the tenants sometimes buy their farms when offered for sale. In Ireland the tenants are almost the only purchasers. In those countries the number of landowners is thus increasing. Moreover, as small owners rarely make family settlements, an increasing part of the land in Wales and Ireland is no longer subject to a system of entails, but is held by tenants in fee simple.

[For the legal learning of entails, the reader may consult Kenelm Digby's *History of the English Law of Real Property*.—Williams' *Law of Real Property*.—Goodeve, *Modern Law of Real Property*.—*The Land Laws*, by Sir Frederick Pollock (English Citizen Series), and many other text-books, together with the statutes and leading cases to which they make reference. Some interesting observations upon the rise of feudal systems of tenure, upon entails and primogeniture, will be found in Maine's *Ancient Law*, ch. vii., and *Early Law and Custom*, ch. ix.

Of the writers who have considered entails in their economic aspect, only a few can be mentioned here: Adam Smith, *Wealth of Nations*, bk. iii. ch. ii., who dwells on the injustice to younger children caused by entails, and asserts in terms much too absolute the improbability of a great proprietor executing great improvements.—M'Culloch, *Principles of Political Economy*, who justifies primogeniture by its effect in raising the fashionable standard of living, and so giving an impetus to the pursuit of wealth.—Mill, *Principles of Political Economy*, bk. v. ch. ix., who condemns entails partly as encouraging idleness and extravagance, partly on the grounds above explained at length.—Boyd-Kinnear, *Principles of Property in Land*.—Cliffe Leslie, *Land Systems and Industrial Economy*.—A volume of the Cobden Club Essays, entitled *Systems of Land Tenure in various Countries*.—George Brodrick, *English Land and Landlords* (also included in the Cobden Club Essays).—Shaw Lefevre, *English and Irish Land Questions*.—Arthur Arnold, *Free Land*.—Kay, *Free Trade in Land*, etc. None of these writers can be said to have fully considered the latest stage of the English law relating to this subject, and therefore many of their criticisms are partially obsolete.] F. C. M.

[Refer for other sides of the question to BEQUEST, POWER OF; MORCELLEMENT.]

ENTAIL (SCOTLAND) anciently and still sometimes called tailzie, from Lat. *talliatum*, cut off; any deed by which the ordinary legal course of succession is cut off and a fresh one substituted. The power to create an entail, previously doubtful in Scotland, was definitely given by the act 1685 c. 22. Every proprietor in fee since that date may grant a simple destination which merely names a succession of heirs, each one of whom may dispose of the estate as he pleases, and whose successor in the destination merely takes in default of such disposition, or he may protect the succession he prescribes by restrictive clauses forbidding any interference with the succession by selling, alienating, or disposing of the lands, contracting debt, or doing any deed whereby the succession might be frustrated. These clauses must be inserted in all title-deeds, and the entail with the judicial authority of the court of session

must be recorded. Every act or deed contravening these restrictions was declared null, and the real heir might, on contravention, take up the estate. In 1770 the heir in possession of entailed lands was allowed a modified power of leasing, and of charging against future heirs a proportion of the expense of improvements on the property by the Montgomery Act, 10 Geo. III. c. 51. Further relaxations were granted in 1824 by the Aberdeen Act, 5 Geo. IV. c. 87, enabling an heir of entail in possession to make limited provisions in favour of a husband or wife or children, which were payable by the successors out of the yearly rents or proceeds, but did not affect the fee of the entailed estates; by the Rutherfurd Act 1848 the fee may now be charged in favour of younger children. But no powers either under the Montgomery Act or the Aberdeen Act could be exercised so as to deprive the successors of more than two-thirds of the free yearly rents. In 1836 the Rosebery Act, 6 & 7 Will. IV. c. 42, gave the heir in possession a limited power to sell parts of the estate for the entailer's debts under the authority of the court of session. In 1848 the Rutherfurd Act, 11 & 12 Vict. c. 36, first conferred on an heir of entail in possession the power to disentail. Elaborate and intricate provisions were made by the Rutherfurd Act distinguishing between entails made before and after its date, and heirs in possession who were born before or after that date, with regard to the consents required to disentail. Broadly speaking, if the heir in possession was born before the act and the entail was made before the act, he requires the consent of all the heirs if less than three, or of the next three heirs, or of the heir apparent and two of the heirs who would, including the heir apparent, be successively heirs apparent, provided the nearest heir be twenty-one years old; or if such consents be refused by any heir, even, since 1882, the nearest heir for the time, the court may assess the value of the heir's interest and dispense with his consent on the payment to him of the value of his interest, or sufficient security for such payment. The next heir in succession thus receives a lump sum for his expectancy instead of getting, as in England, the interest of the purchase money if and when he succeeds in lieu of his interest in the land. The distinction between old and new entails is now removed. Other powers now possessed by heirs in possession of entailed estates are—to sell under the same conditions as those of disentailing, to excamb, or exchange, any portion of the entailed estate for an equivalent in contiguous lands, without any consent, taking or giving not more than £200 for equality of exchange, to grant feus and leases, to charge improvements, and to charge family provisions in favour of the wives, husbands, or children of heirs of entail in possession.

[Rankine, *Land Ownership*, chap. xxxiv.—Bell's *Principles*, § 1716, *et seq.*—Duff on *Entails*.—Duncan on *Entail Procedure*.] J. W. B. I.

ENTREPÔTS. A term applied in France and other countries to places of deposit for goods, analogous to the bonded warehouses in the ports and trade centres of the British Empire. In them articles subject to custom or excise duties may be placed, until time of payment of the imposts to which they are liable on delivery for consumption, or until removal for the convenience of trade, or exportation to foreign countries. In the latter case the importers are relieved altogether from the necessity of the revenue payments, and in the others this outlay need not be incurred until such time as the consumers are ready for their use. In this country, where an immense transit trade centralises, where the operations are often of great magnitude, and the few duties retained are great in proportion to the prime cost of the articles, the facilities afforded by this system permit of much trade being carried on which would otherwise be cramped or altogether prevented. The use of capital is economised, and excessive fluctuations in price are checked by the large stocks it is possible to retain on hand, as well as the speed with which supplies may be transferred to the consumers, at a lessened cost for time and money expended. On the other hand, the care bestowed upon their safe custody, and the supervision of the necessary operations, such as sorting, vatting, and other processes, constitutes a charge upon the revenue for the benefit of the consumer or trader.

These observations apply with much greater force to the "entrepôts" established in France and elsewhere, because of the multitude of articles which have, for the security of the revenue, to be taken in charge, at a considerable cost if the supervision be effectual, or of risk if it be insufficient. There, too, it is not only the national revenue which, as here, has to be safeguarded, but also the municipal tolls in the shape of *octroi*. It is mainly this which has led to the division of these *entrepôts* into "*réels*" where the goods are actually kept in custody, and "*fictifs*," nominal or conventional, where the owner has them in his own charge, but is answerable for the payment of the duties to which they are liable. See also BONDED WAREHOUSES.

[*Nouveau Dictionnaire d'Économie Politique*, 1891, vol. i. p. 898; and *Dictionnaire des Finances*, 1889, vol. ii. p. 118.] S. BO.

ENTREPRENEUR. An alternative name for the employer (see EMPLOYERS and EMPLOYED). Adam Smith (*Wealth of Nations*, bk. i. ch. vi.) used the term "undertaker," and J. S. Mill (*Political Economy*, bk. ii. ch. xv. § 1 footnote), expresses his regret that "this word, in this sense, is not familiar to an English ear." He adds that "French political economists enjoy a great advantage in being able to

speak currently of 'les profits de l'entrepreneur'"; and it seems that, partly perhaps in consequence of this, political economy has in France avoided the mistake committed by some of the older English economists in failing to distinguish the functions of the employer and his share in the produce of industry as such from the functions and share of the capitalist as such. General F. A. Walker (*Wages Question*, ch. xiv.) echoes Mill's regret that "we have not a single English word which exactly fits the person who performs" the office of the employer in modern industry. "The word undertaker," he remarks, "at one time had very much this extent," and so had the word "adventurer." But they have since acquired other senses. The "French word entrepreneur," however, he adds, "has very nearly the desired significance, and it may be that the exigencies of politico-economical reasoning will yet lead to its being naturalised among us." L. L. P.

[See also FRENCH SCHOOL.]

ENTRY, BILL OF. The name given to an office within the custom house at London, and other ports of the United Kingdom, from which there issue daily lists of ships arriving and sailing, with accounts of their cargoes, deliveries from bonded warehouses, and other particulars of considerable interest to the mercantile community. In addition to these printed publications, manuscript accounts are rendered to those who may desire such special information as can be gleaned from the customs records, or may be compiled from the various documents and forms supplied for customs purposes. The printed lists are sold to subscribers, and the special returns are paid for in proportion to their length or the trouble involved in their preparation, for the exclusive use of those at whose expense they are compiled.

The history of this arrangement is somewhat peculiar; it is, or was until recently, a remnant of the old times when special privileges were conferred on favoured individuals for their pecuniary advantage, or in return for payments made by them. One of these acquired, in 1660, by letters patent, the exclusive right of access to all official documents connected with the customs reports and entries, and of obtaining and publishing any portion of the information they furnished. Ultimately, in 1817, this right became vested in the Customs Annuity and Benevolent Fund—a mutual insurance fund supported by payments of the officers themselves, supplemented by the profits of the bill of entry, and devoted to the sole benefit of their widows and orphans. Through the energy and wisdom of the directors this had grown to be a valuable business, which, at the expiration of the crown patent, in 1880, the treasury appropriated to its own benefit, and it is now profitably carried on by the commissioners of customs. The public funds thus became possessors of a private property created by independent exertions on behalf of a charitable purpose.

The existence of such a source of information is of great advantage to merchants, statisticians, traders, and shipowners, by enabling them to obtain correct knowledge on points too minute, too varied, and too numerous to be set forth in the periodical returns of trade and navigation laid before parliament.

[*Reports of Commissioners of Customs.—Bill of Entry*, Journals A and B.—Bourne, *Royal Statistical Society's Journal*, vol. xxxv. pp. 214-215, 1872.] S. BO.

ENTRY, RIGHT OF. The payment of the rent, and the performance of the covenants in a lease, are usually secured by a "condition or proviso for re-entry," which enables the landlord on non-payment of the rent or non-performance of the covenants, to take possession of the premises let, as if no lease had been made. The courts of equity and the legislature have, in a certain measure, succeeded in preventing landlords from making any oppressive use of this power. Thus a tenant who has been ejected in consequence of the non-payment of rent may be reinstated if he pays the rent and costs within six months after the execution of the judgment. As regards the non-performance of covenants, not relating to the payment of rent, and not belonging to one of the excepted classes referred to below, a right of re-entry or forfeiture is not enforceable unless the tenant has failed to comply with the terms of a notice specifying the breach and requiring him to remedy it and to pay compensation in money in respect of it (Conveyancing Act, 1881, § 14). In such cases forfeiture is therefore impossible, except when the breach is wilful and persistent. The rule just mentioned does not, however, extend to covenants against assigning and underletting, and the omission to obtain the landlord's consent to an assignment or underlease of the premises may lead to the forfeiture of the lease although it was due to forgetfulness on the part of the tenant's solicitor, and although the landlord would not, under the circumstances, have withheld his consent if asked for (Barrow *v.* Isaacs [1891], i.; Queen's Bench, 417). The attempts to induce the legislature to enact some provisions more favourable to tenants in respect of such covenants have proved abortive, and their only result has been § 3 of the Conveyancing Act of 1892, which provides that in the absence of an express agreement to the contrary, a landlord shall not make his consent to an assignment or underletting dependent on the payment of a sum of money beyond a reasonable amount in respect of expenses. Conditions for forfeiture on the bankruptcy of the tenant, or on the taking in execution of the tenant's interest, were also originally excepted from the rule granting relief

as stated above; but it is now provided by §§ 2 and 3 of the Conveyancing Act of 1892 that, subject to certain exceptions, a lease is not to be forfeited in such a case, unless the tenant's interest remains unsold within a year after the date of the bankruptcy or of the taking in execution. The practical importance of the exception is materially reduced by this alteration. E. S.

ENUMERATED COMMODITIES. This term has two distinct meanings, according as it is applied: (1) to the European trade of England; (2) to the colonial trade of England. In both cases it refers to commodities which were originally enumerated in the Navigation Act of 1660, but which were altered from time to time by subsequent legislation.

(1) With regard to the European trade, the first Navigation Act in 1651 forbade the importation of European products except in British ships, or ships of the country where the goods were produced, or from which they could only be, or most usually were, exported. The second Navigation Act in 1660, while adopting most of the provisions of 1651, modified this particular article. It renewed the restriction about importation to (1) all Russian and Turkish products, and (2) certain enumerated commodities: viz. timber, salt, pitch, tar, rosin, hemp and flax, raisins, figs, prunes, olive oils, all kinds of corn or grain, sugar or potashes, wines, vinegar and spirits (12 Car. II. c. 18, § 8). All other European goods could be imported in any vessel. Two years later a further restriction was made, and it was provided that certain goods should not be imported into England in any ship whatever from Germany, Holland, and the Spanish Netherlands. This second list of enumerated commodities included all wines other than Rhenish, spices, grocery, tobacco, potashes, pitch, tar, salt, resin, timber, and olive oil (13 & 14 Car. II. c. 11, § 23). Changes in the enumeration were made at intervals in obedience to momentary pressure or changing interests. But no great relaxation of the system of 1660 and 1662 was made till 1822, when the importation of enumerated goods was extended to ships of the country or place from which they were imported; and at the same time the exceptional restrictions upon trade with Germany, the Netherlands, Russia, and Turkey, were abolished (3 Geo. IV. c. 43, § 6). The distinction between enumerated and non-enumerated commodities disappears altogether after the repeal of the Navigation Act in 1849.

(2) As applied to the colonial trade, the term enumerated commodities had an equally important significance. The act of 1660 limited all trade, both of export and import, with British plantations in Asia, Africa, or America to British ships. But it added a distinction between those colonial products which could only be carried to England and those which might be carried, still in British ships, to countries other than England. The former, which are the enumerated commodities in this connection, naturally included all those commodities which England did not produce herself, or did not produce in sufficient quantity for her needs. The non-enumerated commodities, which included all those goods in which the home producers dreaded colonial rivalry, were originally allowed to choose any market outside England, but were ultimately limited to countries south of Cape Finisterre. The motive for this restriction was to prevent the manufacturing rivals of England from obtaining raw materials from our colonies. These and other oppressive regulations with regard to colonial trade were undoubtedly a chief cause of the revolt in 1774 of the American colonies, whose success dealt a fatal blow at the policy of the navigation acts, and in 1796 the United States were allowed to carry their goods in their own ships to Great Britain. In 1822, the distinction of enumerated commodities among colonial products became obsolete, and the colonies were allowed to export not only their own produce, but their imports from other countries, to any place in Europe, Africa, or America, either in British ships or in ships of the country to which they were exported (3 Geo. IV. c. 44, § 4, and c. 45, § 2).

[M'Culloch's edition of Adam Smith, note xi., and Leone Levi, *History of British Commerce*, pt. iii. ch. ii., give a clear account of the enumerated commodities in European trade. For the term as applied to colonial products see Adam Smith, *Wealth of Nations*, bk. iv. ch. vii. pt. 2.] R. L.

ÉPHÉMÉRIDES. About the middle of the 18th century proposals for reform both in finance and agriculture began to interest the French public. In 1751 a special review, the *Journal œconomique ou Mémoires, Notes et Avis sur l'agriculture, les arts, et le commerce*, was established in order to deal with these subjects. This journal contained essays both on practical and theoretical questions; the latter presenting restrictive as well as liberal views. Recommendations of free-trade in corn, and translations of the works of English economists, such as Tucker and Hume, strengthened the position of the French school of free trade who became afterwards the physiocrats. The *Gazette du Commerce*, established in April 1763, admitted the contributions of Le Trosne and St. Péravy as well as those of their opponents. The government, favouring these discussions on the corn policy, bought up this newspaper and connected with the *Gazette du Commerce* a special review, the *Journal de l'Agriculture, du Commerce, et des Finances* (1764). This *Journal* soon passed into the sole possession of the physiocrats and was their organ from September 1765 to November 1766. It ceased to appear in 1783.

Among the periodicals treating on subjects akin to those dealt with by the *Journal de l'Agriculture* was a weekly paper, the *Éphémérides du Citoyen ou chronique de l'esprit national* (6 vols. 12mo), established in December 1765, after the model of Addison's *Spectator*, by the Abbé Baudeau. He intended through its means to defend the interests of "humanism" by pleading for the abolition of slavery in the colonies. He, however, employed his organ to attack the Economists, professing for his own part mercantilist views and a detestation of free-trade. Le Trosne replied in the *Journal de l'Agriculture* of March 1766 to Baudeau; the latter answered, but soon desisted, for, after reading but half a page of Le Trosne's private observations on the futility of the "balance of trade," he abandoned his intention of continuing these polemics. Shortly after this the Marquis of Mirabeau brought Baudeau fully to agree with the physiocratic school. This event, *le saut de la science*, proved very important for the progress of the Economists. For the *Éphémérides* was ready to receive their contributions just at the time that the editor of the *Journal de l'Agriculture* put difficulties in their way (December 1766). After January 1767 the new organ appeared as a monthly review under the title *Éphémérides du Citoyen, ou Bibliothèque raisonnée des Sciences morales et politiques*. Baudeau remained its editor till May 1768, when his place was taken by Du Pont de Nemours. The most eminent writers of the physiocratic school contributed to this journal. Among the most interesting articles are the following:—Quesnay's "Essays on the Government of Peru" (1767, t. i.); he declares that the system of tithes in Peru proves its ancient government to have been the most prosperous and the fairest in the world.—On "Despotism in China" *signed* M.A. (1767, t. iii., iv., v., vi.), in which he describes Chinese political institutions as exhibiting "an order of essential stability," besides minor articles (1767, t. x., 1768, t. ii.); cp. Oncken's edition of Quesnay's *Œuvres*, pp. 660-692.—Mirabeau's "Letters on the Legal Order." In these he undertakes to give an historical account of the causes of economic legislation, and the study of the "physical" causes leading towards its reform (1767, t. ix., x., xi., xii.; 1768, t. i. to vi., viii. to xii.; 1769, t. i. to iii., v.).—On the economic education of girls; insisting upon the necessity of instructing them in the science of the natural social order (1768, t. iii.).—Dialogues between a child and its teacher, on the use of science to princes (1769, t. vi. to ix.).—Historical eulogies on Sully, whose merits as statesman and as a predecessor of the physiocratic school are dilated on (1770, t. iii. to xii.; 1771, t. i. to xi.).—Baudeau wrote "Avis au peuple sur son premier besoin," treating of a free trade in corn, the best manner of baking bread, and on its price (1768, t. i., ii., iv., v.). "Avis aux honnêtes gens, qui veulent bien faire," dealing with the effects of the bad harvest of 1769, and the methods pursued to cheapen the price of bread (1768, t. x., xi.; 1769, t. x.). An Explanation of the Tableau Économique to Madame de —— ("political economy made easy") (1767, t. xi., xii.; 1768, t. viii.; 1770, t. ii.). On luxury, its destructive effects on agriculture (1767, t. i. to iii.). "On the actual state of Poland," on the causes leading to its destruction by the Moscow policy (1770, t. ii. to iv., xi.; 1771, t. i., iii. to v.).—There are also some observations by Butré respecting agriculture on a large and a small scale, illustrated by accounts of farms and estates cultivated on the Métayer principle, and proving the unprofitable character of the latter (1767, t. ix., xi., xii.).—Among Du Pont's contributions his "Notice abrégée" containing the first sketch of a history of economics, particularly deserves mention (1769, t. i. to iv., vi., ix.; 1770, t. i. *avertissement*).—Among the latest important articles were Turgot's "Réflexions sur la formation et la distribution des richesses" (published in 1769, t. xi., xii., and 1770, t. i., but written in November 1766) and the "Abrégé de l'économie politique" by the Margrave of Baden-Durlach (1772, t. i.).—Minor articles were written by Roubaud, St. Péravy, Le Trosne, Morellet, Franklin.—Criticisms are also included directed against Linguet (1767, t. iii.; 1770, t. i.), who, in his *Théorie des lois civiles*, 1767, had taken no notice of the physiocratic conception of natural law, and in accordance with Hobbeism had declared that "l'esprit des lois—c'est la propriété"; Forbonnais, who is censured on account of his attacks against the physiocratic theory that trade was a simple exchange and not affording a "produit net" (1767, t. vi., ix.);—against the attempted refutation of their doctrine by Graslin, the author of an *Essai sur la Richesse et sur l'Impôt* (1768, vol. ii., iii., x.);—against the *Doutes adressés aux philosophes économistes* by Mably, who had from the communistic standpoint attacked the foundation of this system, the right of private property (1768, t. ii., iii., v. to viii.; 1769, t. v.).—The *Éléments généraux de Police* of Justi (1769, French edition), is shown to be a work of very shallow and contradictory views, which maintains the wisdom of grandmotherly regulations (1769, t. ii., iii.); Galiani's *Dialogues sur le Commerce des Bleds*, one of the wittiest productions of economic literature, is described as "un ouvrage charmant, qui renferme les plus jolis lazzis du monde" (1769, t. xi., xii.); Baudeau also criticised Beardé de L'Abbaye's *Recherches sur les moyens de supprimer les impôts, précédées de l'examen de la nouvelle Science*, 1770, a criticism directed against the single-tax theory (1770, t. vii.); and Pinto the mercantilist "Pindar of the stock exchange" (*Traité de la circulation et du*

crédit, 1771), (1771, t. x.). Besides these articles the review contained a chronicle of public events considered to be symptoms of the progress of the doctrine of the physiocrats: this includes the utterances of the French *parlements* in the provinces on the corn-trade; the emancipation of serfs in Denmark; the encouragement given publicly to agriculture by the heir-apparent of the crown (Louis XV. being king), the Dauphin Louis, who on the 15th June 1768 himself held the plough at Versailles (1768, t. vii.; 1769, t. viii.). Louis was followed in this by the Emperor Joseph II., who drove a peasant's plough, the 19th August 1769, at Slavikovitz in Moravia (1770, t. xii.). These events have been commented on by Diderot in a review which he wrote about the *Éphémérides*, in the following words: "Plough, plough as much as you will; I promise you that as long as matters stand on their present footing, the wheatsheaf growing under your royal hands will not nourish your peasants" (*Œuvres*, t. iv. p. 85). An account is given of an experiment made by the Marquis of Mirabeau and his son at Aigueperce in Limousin, to form a *bureau de conciliation*, composed of prud'hommes elected by the parishes, in order to avoid the frequency of lawsuits. The experiment was imitated by the Marquis de Sérent at Malestroit in Bretagne; it was a precursor of the modern boards of conciliation (1771, t. iii. p. 110-194; t. vii. p. 183, cp. Loménie, *Les Mirabeau*, t. ii. p. 79; t. iii. p. 59). This part of the *Éphémérides* contains some statements about financial reforms in foreign countries, especially of the experiment of a "single tax" on land (*impôt unique*) in Baden (1771, t. iv., v., vi., vii.), with the performance of which Schlettwein was entrusted in the village of Dietlingen (1770) (see Impôt Unique).

The *Éphémérides* was suppressed by the Controller-Général, the Abbé Terray, in November 1772 (t. iii. is the last of the sixty-three volumes of this series). The editors sought in vain to connect themselves with other journals. It is characteristic of him that, after being forbidden to publish the *Éphémérides* in 1772, Du Pont continued to work in their line by issuing a fortnightly *Correspondance littéraire et politique* in MS., and to send transcripts to the monarchs interested in the physiocratic doctrines (cp. *Carl Friedrichs von Baden brieflicher Verkehr mit Mirabeau und Du Pont*, edited by Carl Knies, Heidelberg, 1892, vol. i. p. 151-152; cp. also vol. i. pp. 21, 56, 57, 61; vol. ii. p. 109 *seq.*, 197). After a three years' silence Turgot, who had become minister, enabled the Abbé Baudeau to resuscitate the review. It thus became almost an official organ intended to explain and justify Turgot's politics. In December 1774 appeared the first part of these *Nouvelles Éphémérides Économiques, ou Bibliothèque raisonnée de l'Histoire et de la Politique* (18 vols., 12 in 1775, 6 in 1776). The *Journal de l'Agriculture* too became again an organ of the physiocratic school under the direction of Abbé Roubaud. Among the contents of the *Nouvelles Éphémérides*, the following are remarkable: "Letters and Memoirs written to a Magistrate of the Paris Parliament on the Arrêt of September 13th, 1774," by Baudeau (1775, t. i.) This is an historical and theoretical interpretation of the causes which lead on to Turgot's celebrated ordinance, by which the free circulation of corn in the provinces of France was established and its free exportation abroad was made the object of future decisions of the government (see Turgot, *Œuvres*, 1844, t. ii. p. 169).—Bigot de Ste. Croix's posthumous *Essay on the Abuse of Exclusive Privileges, on the Freedom of Trade and Industry* (1775, t. i. iii.), is a literary forerunner of the abolition of corporations by Turgot.—The third part of vol. i. (1775) opens with an *Éloge funèbre de M. François Quesnay*, delivered by the Marquis de Mirabeau four days after the master's death, the 20th December 1774. T. v. of the same year contains an historical eulogium of Quesnay by the Count d'Albon.—Baudeau again contributes inquiries and historical memoirs on the finances of France from Louis XII. to Louis XV. (1775, t. ii., iii.), and a refutation of an author who had written in defence of the Corvée system.—The Marquis de Pezay writes an essay on *The Fortification of the Military Frontiers of Alsace*.—Fréville inserts a translation of extracts from A. Young's *Eastern Tour through England* (1775, t. ii. iii.), and *On the Present State of British Commerce* (1775, t. viii.) Turgot's ordinance, which allows again leases of twenty-nine years' duration (January 2, 1775) is published as a memorable event (t. ii.).—The general aspects of the school are dealt with in a *Letter on the Economists* (1775, t. iii.); in this the contrast between formal liberty, adhered to by the economists, is contrasted with the postulate of economic equality and the latter declared unnatural. Still the fundamental principle of the economists is declared to be the truth, that "the particular happiness of individuals can only be reasonably and firmly established upon the basis of the general happiness of the whole race" (1775, t. iii. p. 59). The philosophical and political ideas of the physiocratic school are embodied in a *Memoir on Public Instruction* by Mercier de la Rivière (1775, t. ix. x.), and in Roubaud's *Political Reflections on America* (1776, t. iii.), which are full of sympathy for separation of the colonies from England.—Finances are dealt with in *Reflections of a Citizen on the financial administration of great cities, and especially of the City of Lyons* (t. iv.), written to oppose indirect local taxation; they exhibit the destructive tendency of the physiocratic doctrine for local life by subjecting it to central government. An essay

is directed against the heavy taxation of tanneries after 1759 (1775, t. iv., also 1776, t. iv.), and of salt, spirituous liquors and tobacco; this essay, *Le Profit du Peuple et le Profit du Roi*, had been previously written in 1769 by Baudeau, and twelve copies only printed, 1775, t. iv.; cp. a letter to Baudeau on that subject in 1775, t. x., extracted from *Nouvelles de la République des Lettres* (Lausanne, vol. i. 1775); cp. also the criticisms on Baudeau's essay contained in *Nouv. Éph.*, 1776, t. ii. p. 70, taken from the *Journal Encyclopédique* of 1775, vol. viii. Other articles deal with the suppression of the duty on fish coming to Paris during Easter-time (1776, t. iv., and Turgot, *Œuvres*, ed. Daire, vol. ii. p. 402), and the suppression of a series of duties in Russia by Catherine II. (17th (28th) March 1775, t. vii.). Historical details are given relative to duties laid on eggs, butter, cheese (1776, t. i.), on wines coming to Paris (1775, t. v.), and likewise on such imports within Champagne (1776, t. iii.). A new method of levying the duty on brandy is described, and the weight of the impost of 1771 on the manufacture of paper, 33 per cent on the cheapest sorts, is complained of (1776, t. v.). A document, proving the antiquity of complaints on French finances, from the year 1415, is published in 1775, t. xi. An essay of Baudeau, written in 1768 was published for the first time in 1776, t. i., on the occasion of the abolition of the "Caisse de Poissy" on the 9th February 1776 (see Turgot, *Œuvres*, vol. ii. p. 316); this institution since 1743 had farmed the exclusive market right of meat for Paris to a company, which was entitled by it to take a duty of 6 per cent upon all sales of meat at Sceaux and at Poissy. Baudeau's article produced great irritation among the partners in the company, who brought an action against its author; the text of the latter is inserted in *Nouv. Éph.*, 1776, t. vi. This volume also contains a "memoir on the taxes raised in unforeseen cases ('affaires extraordinaires') in France during the war of 1756-1763." They amounted to no less than 1,105,227,761 livres.

The free-trade movement is represented by a memoir written by M. Belly on the decline of the trade of Leghorn in consequence of the number of charges (1775, t. vi.); the same author contributes an essay on the state of commerce and manufactures in Italy (t. vii.) The obstacles to the shipping trade in the Rhone (1775, t. ix., t. xi.), and to the exportation of iron (1776, t. iv.), are complained of, and a petition of the Guyenne chamber of commerce for free trade to the East Indies is published (1776, t. iv.).

Among the events favourable to the economists the following are worth mention:—The correspondence of King Gustavus of Sweden (when a youth) with Count Tessein and Scheffer, published by Col. St. Maurice de St. Leu (1775, t. iv., 1776, t. ii.); the foundation of a "Société d'émulation" in Paris after the model of the London "Society for encouraging arts and manufactures," the rules of which are contained in 1775, t. ix. The economic reforms introduced in Tuscany by the Grand-duke Leopold, and enumerated in *Saggi di Agricoltura; di un Paroco Siamminiatese*, Florence 1775, are favourably reported on. Among these the erection of a kind of co-operative store at Florence for the sale of all sorts of goods deserves mention; upon the abolition of corporations it was imitated at Paris by the Bureau de Correspondance Générale, March 1776 (*N. Éph.* 1776, t. iii. p. 177). The publication of *Ephemeriden der Menschheit* by Isaac Iselin at Basel is chronicled with enthusiasm by Baudeau.

The literary movement is represented by a lengthy criticism of Necker's book, *Sur le Commerce et la Législation des Grains*. It marks the distinct contrast between social protectionism and the spirit of individual property; the contrast between landed and moneyed "capitalism." (*Eclaircissements demandés à M. N——, au nom des Propriétaires Fonciers et des Cultivateurs français* 1775, t. v. 65-168, t. vii. 89-167, t. viii. 93-139, and Baudeau's letters to M. N. on his "Éloge de Colbert," held at the French academy in 1774, t. ix. pp. 44-106). A letter directed against the free-trade theory of the economists by the Count de Magnières (t. xii.) is refuted by M. de R——(?) in 1776, t. ii.—A review of the book of Condillac, *Sur le Commerce et le Gouvernement* (1776, t. iv. pp. 109-130, t. v. pp. 131-147), written by Baudeau, treats this author as a heretic from the orthodox school. "The true economists are easy to characterise by one feature which everybody understands. They recognise one master (the doctor Quesnay), one doctrine (that contained in the *Philosophie rurale* and the *Analyse Économique*), classical text-books (the *Physiocratie*), and technical terms . . . precisely like the old scholars of China" (p. iii.).

The *Nouvelles Éphémérides* ceased in June 1776, on the dismissal of Turgot from the ministry (12th May 1776), after which date the only organ of the physiocrats was the *Journal de l'Agriculture*, which Roubaud had reconstituted in 1775; but this periodical also came to an end in 1783. Baudeau made a last effort to re-establish his former review, for there are at the Bibliothèque Nationale at Paris three volumes of *Nouvelles Éphémérides économiques* of 1788 (Paris, Onfroi et Royer) extant. These contain attacks against Colbert and Necker, historical remarks on Sully; fundamental questions of economics, inquiries into the origin of taxation among the Greeks and Romans, and on the influence of morals on agriculture by the Marquis de P——(?).

In 1789 appeared *Éphémérides de l'Humanité ou bibliothèque raisonnée des sciences morales.* Tome premier (and last), aux dépens de la Société. This is probably the last utterance of this kind made by the Économistes, and is entirely written by A. F. J. Fréville. It begins with a lengthy exposition of their doctrines (pp. 1-68), contains articles on the principles of taxation (pp. 108-132), and their application to the Austro-Belgian provinces (pp. 337-394); others against Necker's theory of the circulation of riches, as enunciated in his book, *De l'administration des finances en France*, t. iii. ch. xxi. (pp. 284-336). The greater part of the volume deals, however, with political questions; it is filled up with polemics against the champions of absolutism, such as Count Windischgraetz (pp. 68-108, 133-158, 265-284), and with observations on the convocation of the *États généraux* (pp. 159-264). It closes with a philosophical letter on Montesquieu's *Esprit des lois* (pp. 395-400). Constitutional questions being at this time the most prominent ones, and economic problems standing more in the background, this publication ceased with its first volume. The *Journal d'Économie publique, de Morale et de Politique*, edited by Roederer and Morellet appeared August 1796.

The *Éphémérides* thus played an important part in the literary life of economics during the 18th century. As an example it may be mentioned that Lavoisier, in his introductory remarks to his statistics *De la Richesse territoriale du Royaume de France*, printed by order of the national assembly in 1791, and reprinted in 1797 in the *Journal d'Économie publique*, edited by Roederer, mentions Quesnay as having reached the same conclusions as himself, and notes the fact that Quesnay's statistics were the occasion of Voltaire's *L'Homme aux quarante écus.* The *Éphémérides* formed a scientific economic review written with a distinct practical tendency, namely, to struggle for free trade, free enterprise, and equal taxation; to combat the crushing burdens imposed by commercial restraints, industrial monopoly, arbitrary assessment, and lavish public expenditure. Being in the exclusive possession of a "school," they preserved, in spite of the variety of their contents, a systematic uniformity in method and policy. Besides exhibiting the first example of journalism made subservient to social science, they are the richest source for the history of contemporary economic life, and the growth of modern ideas, not only in France but even in eastern Europe.

Their immediate influence in France was rather short-lived, and after the outbreak of the Revolution they became so entirely forgotten as to enable the tale to be spread that they had been written in order to help Voltaire, Servan, and Bovier to establish a democratic revolution (Abbé Barruel, *Mémoires pour servir à l'histoire du Jacobinisme*, Londres 1797, 2nd pt. pp. 210-215). The interest, however, which the *Éphémérides* excited abroad was a far-reaching one; and by inducing monarchs, statesmen, and landlords to introduce agricultural and financial reforms, to alleviate feudal burdens and commercial restraints, they benefited even the lower classes in Sweden, Denmark, Baden, Austria, and Tuscany. Thus they helped towards transplanting economic progress eastwards both in thought and practice.

[An account of the origin of this review is given in the *Journal de l'Agriculture*, March 1766; in the *Éphémérides*, 1769, t. iv., v.; in the *Dictionnaire de l'Économie Politique*, under the heading "Éphémérides du Citoyen"; in the *Nouveau Dictionnaire d'Économie Politique* the information will be found under the heading "Baudeau." See also Loménie, *Les Mirabeau*, 1879, t. ii. p. 251. Levallois, *Rousseau, ses amis et ses ennemis*, 1865, t. ii. p. 385.—G. Schelle, *Du Pont de Nemours et l'école physiocratique*, 1888, pp. 43, 99, 125, 144, 211, 408. In Germany Mauvillon complained in 1775 of the want of a German economic review of the value of the *Éphémérides* (*Untersuchungen über die Natur und den Ursprung der Reichtümer und ihrer Vertheilung*, a translation of Turgot); only the next year they were imitated by Isaac Iselin, the editor of *Ephemeriden der Menschheit oder Bibliothek der Sittenlehre und der Politik*, Leipzig, 1776-1782. The only known complete set of the *Nouvelles Éphémérides* belongs to the Giessen University Library (pressmark B. 800),—the use of it was most liberally allowed to the writer of this article, in order to enable him to draw up the above statement.] S. B.

ÉPICES. The French judges down to the revolution were paid partly by salaries (*gages*), and partly by the payments of suitors (*épices*) The latter were originally voluntary presents in kind, and several of the early kings tried to limit their amount. But in the 15th century the *épices* gradually became compulsory and were paid in money. These payments for justice constituted a considerable indirect tax upon the people, and gave rise to many abuses. It was the interest of the judges to spin out cases so as to increase the charges upon suitors, and thus justice became dilatory as well as expensive. On several occasions the states-general, and even the parliament itself, petitioned for the increase of the judges' salaries, in order that the *épices* might be abolished or at least diminished. But the French treasury was never in a condition to adopt this very simple remedy, and the abuse of *épices* lasted till the constituent assembly abolished the old parliaments, and made justice gratuitous.

[Adam Smith, *Wealth of Nations*, bk. v. ch. ii. pt. 2.] R. L.

EQUALISATION OF INTERNATIONAL DEMAND. The equation of international demand is a particular case "of the more general

law of VALUE (*q.v.*) . . . called the equation of supply and demand," but presents some peculiarities which almost justify Mill (*Principles of Political Economy*, bk. iii. ch. 18, § 4), in describing it as "an *extension*" of that law. These are: the absence of (1) a single market—which allows the substitution of price for value in discussing domestic trade, and (2) of the regulator given by cost of production (see INTERNATIONAL TRADE). An analysis of the forces tending to bring about equilibrium of supply and demand, always important, is here essential.

On the simplest supposition—that of two countries trading in two commodities—each article is necessarily the price of the other, and the equation of reciprocal demand is the evident outcome of the bargaining on each side, carried to the point at which no additional advantage can be gained. When several commodities enter into foreign trade the equation is established in substantially the same way. Values are so arranged that the sum of exports is *equivalent* to that of imports, since, were it otherwise, readjustment of quantities, of values, or of both, would be necessary. In the actual complications of foreign trade carried on between many countries the law takes a somewhat different form. "It may be concisely stated as follows. The produce of a country exchanges for the produce of other countries at such values as are required, in order that the whole of her exports may exactly pay for the whole of her imports" (Mill, *Principles*, bk. iii. ch. 18, § 4). Though each country must export to an amount equal to what it imports, its trade with any one country may mainly or even exclusively be import or export, an excess on either side being compensated by a corresponding deficit in the trade with other countries.

The statement of the equation of international demand has to be further modified so as to include the effect of the various elements of *indebtedness*. All debts due to a country act like an effectual demand created by the same value of exports. The principal heads are: (1) interest on foreign loans or on capital invested abroad; (2) freightage for shipping services; (3) such items as (*a*) tribute due by foreign states; (*b*) earnings of citizens abroad; (*c*) expenditure of foreigners travelling in the country. Accordingly, the final result is that "the state of international demand which results in commercial equilibrium is realised when the reciprocal demand of trading countries produces such a relation of imports and exports amongst them as enables each country, by means of her exports, to discharge all her foreign liabilities" (Cairnes, *Leading Principles*, bk. iii. ch. 18, § 5). In the most complicated as in the simplest case, the force producing equilibrium is the action of self-interest, causing the supply of commodities for exchange at such terms as will afford the maximum advantage to the trading countries (see GIFFEN, *Essays in Finance*).

The mechanism of PRICE (*q.v.*) enables the complex adjustments of value which are requisite to be easily carried out (see INTERNATIONAL TRADE).

As to the difficult question whether the equation of international demand can be consciously altered to the advantage of one of the parties, see Mill, *Principles*, v. ch. iv. § 6; Cournot, *Principes Mathématiques de la Théorie des Richesses; Théorie des Richesses*, bk. iii. ch. iv.; Sidgwick, bk. iii. ch. v., who maintain that it can; also Torrens, the *Budget*. See *contra*, Jevons, *Theory*, pp. 157, 158.

[See references under INTERNATIONAL TRADE and INTERNATIONAL VALUE, more especially those to Mill, Cairnes, and Mangoldt.] C. F. B.

EQUALITY. The claim for equality may mean in politics (1) simply a claim for just and impartial administration of the laws; or (2) a claim that the laws themselves should not favour one class, still less one individual, at the expense of another; or (3) a claim for equal division of the comforts and discomforts of life. In the economic as distinguished from political doctrine, the claim of equality appears as the basis of the theory of free competition, and takes a form not precisely identical with any one of the three described. Economic reasoning, so far as it is quantitative, must assume a similarity of units. There might be a "free competition" within certain classes of the community only; and thus only the first kind of equality might be secured. An economic theory of the probable effects of such a competition would be perfectly possible. The most striking modern instance is perhaps the industrial system of the southern states of America before the emancipation of the slaves. Where the laws were clearly defined and fairly carried out, the task of the deductive economist would be comparatively easy. He would need indeed to postulate that they were so, before he could draw his theoretical conclusions; and he would then be postulating equality in the first sense, impartial administration. There might also be a state of things in which legislation was professedly indifferent to the privileges of particular classes, and all men were left free so far as legal hindrances were concerned, to seek their fortunes in the same ways. Economic theory would assume in this case that there was equality not only in the first sense, but in the second; and this has been perhaps the commonest assumption of modern economists. It was made by Adam Smith with full consciousness of its utopian character; indeed he could not conceive the possibility of so close an approach to it as has now been made by free-trading England. The full attainment of it is, however, impossible in a community of human beings, so long as they are divided by physical, social, and other

causes, into classes respectively weaker and stronger. The effort of legislation has been to redress such inequality by means of special protection and assistance. The result, though for every other reason desirable, is unfavourable to economic theory, so far as it makes the assumption of legal equality, in the second as well as the first sense, farther removed from the reality. It is no doubt possible to conceive the patronage of the laws as simply an attempt to secure to every one that equality of *opportunities*, of which the reinforcement by the laws of the inequalities of wealth would deprive the poorer members of society. From this point of view an economic theory of free competition could be worked out for competing citizens, supposed equally strong and fit for the race for wealth. But the inequalities left out seem too great for the equality assumed. Even if we neglected other causes of difference, opportunities would never be perfectly equal till human beings were physically and intellectually identical one with another.

On the other hand the effort after an equality of opportunities seems to carry society a step nearer perfection than the effort after justice and legal equality in the senses described. The opportunities may be conceived to be not of making money but of developing the faculties and doing the best work for which a man has the capacities. In all the noblest of the founders of socialistic and communistic schemes, such as aimed at equality in the distribution of wealth, equality of opportunities for the development of human individuality has been the real aim, more or less clearly understood. [See also ARISTOCRACY, COMMUNISM, TAXATION (equality of burdens).]

Wagner, *Lehrbuch; Grundlegung* (1879), 2nd part, §§ 220 to 223, pp. 418-426.—F. Y. Edgeworth, *Mathematical Psychics* (1881), pp. 129, *seq.*—J. S. Mackenzie, *Social Philosophy* (1890), pp. 249, *seq.*] J. B.

EQUATION OF SUPPLY AND DEMAND. (See DEMAND.)

EQUILIBRIUM is discerned by Jevons (*Theory of Political Economy*, ch. iv.) to be a cardinal conception in the abstract science which he elsewhere calls the MECHANICS OF INDUSTRY (*q.v.*). So Professor Marshall, indicating in the preface to his *Principles of Economics* the leading ideas by which he was inspired, says, "the demand for a thing is a continuous function, of which the 'marginal' increment is in stable equilibrium balanced against the corresponding increment of its cost of production." Professor Marshall employs the term *equilibrium amount* as the amount of any commodity produced in a unit of time when the demand for and supply of that commodity are in equilibrium, and when there is therefore no tendency in the quantity produced in a particular time to increase or diminish. The term equilibrium price is similarly used to denote the price of the equilibrium amount in the same circumstances. M. G. D.

EQUITABLE ASSETS. Assets that could be made available for the payment of debts only through a decree or order of a court of equity. Such assets were always treated as a trust fund, and were therefore divided amongst creditors *pari passu* without any regard to the priority of one debt over another. The chief equitable assets are the proceeds arising from the sale of lands devised in trust to pay or charged with the payment of debts.

[Williams on *Executors and Administrators*, pt. iv. bk. i. ch. i., London, 1879.—*The Administration of Assets*, by A. S. Eddis, London, 1880.] J. E. C. M.

EQUITABLE ESTATE. An estate in land that formerly was recognised in a court of equity only. The principal equitable estates are the estate taken by a person entitled to the benefit of land given in trust, equities of redemption (see EQUITY OF REDEMPTION), and equitable charges.

[*Principles of Equity*, by E. H. T. Snell, London, 1892.] J. E. C. M.

EQUITABLE EXECUTION. The method by which a judgment creditor obtains payment by the appointment of a receiver of the rents and profits of the lands of the debtor. At common law certain forms of property, such as the interest of a mortgagor in the mortgaged premises, or the right to an unascertained sum of money, could not be reached by any ordinary writ. When the creditor had exhausted every method of obtaining payment he could resort to the Court of Chancery, who would appoint a receiver. Now the High Court of Justice can appoint a receiver in all cases where it is just and convenient that such appointment should be made.

[*The Law of Execution*, by T. K. Anderson, London, 1889.] J. E. C. M.

EQUITABLE MORTGAGE. A contract for a mortgage that previous to the Judicature Acts could be enforced only in a court of equity. The most usual case in which it arises is where a person deposits the title deeds of property with a creditor as security for a debt. But a mortgage is also "equitable" if the subject matter is trust or equitable property, such as an equity of redemption, or where there is a written agreement to make a mortgage. The mortgagee in every case may either call on the mortgagor to make a legal mortgage or may take proceedings to enforce a foreclosure or a sale.

[*The Principles of Equity*, by E. H. T. Snell, London, 1892.] J. E. C. M.

EQUITABLE WASTE. Waste in the nature of acts of spoliation, that a court will restrain a tenant for life from committing, though his estate was granted to him with liberty to commit waste, such as pulling down the family mansion or cutting down ornamental timber.

[Goodeve, *Law of Real Property*, London, 1891.] J. E. C. M.

EQUITY is the name applied to a number of legal rules, which formerly were administered by the court of chancery. The chancellor was originally the king's secretary, and as such he had to advise the king in "matters of grace and favour"; viz. in matters in which the king's intercession was invoked for the sake of mitigating the strict rules of the common law. "When early in the reign of Edward III. the chancellor ceased to be a part of the king's personal retinue, and to follow the court, his tribunal acquired a more distinct and substantive character . . . ; petitions for grace and favour began to be addressed primarily to him, instead of being simply referred to him by the king, or passed on through his hands. In the twenty-second year of that king such transactions were recognised as the proper province of the chancellor, and from that time his separate and independent equitable jurisdiction began to grow into the possession of that powerful and complicated machinery which belongs to later history" (Stubbs's *Const. History*, ii. 269). One of the most important stages in that growth was reached when, in the reign of Richard II., the "writ of subpœna" was introduced, which enabled the chancellor to enforce obedience to his decrees by the threat of imprisonment. One of the most important matters which came under the chancellor's jurisdiction was the protection of the rights of persons possessed of "uses" in land. For several reasons it had become convenient to sever the legal ownership of land from the beneficial ownership, and with that object it became customary on a transfer of ownership to enfeoff one person "to the use" of another. The first-named person was called the "feoffee to the use," and he was the only person whom the ordinary courts recognised; but as he was in duty and conscience bound to allow the rights of beneficial ownership to the second-named person, known by the technical name of "cestui que use," the chancellor in the exercise of his equitable jurisdiction compelled him to do so, if he wished to take advantage of his formal right. The practice in matters of this nature developed into a regular system called "equity," to distinguish it from the "common law" administered by the other courts. That system was characterised—(1) by the recognition of rights which the other courts refused to enforce (so-called "equitable rights"); (2) by legal doctrines differing in substance from the doctrines of common law; (3) by a special procedure; (4) by special kinds of relief.

(1) The most conspicuous among equitable rights are the rights derived from trusts. Trusts are the modern successors of "uses," but are used on a much larger scale, and also in the case of personal property; the most familiar instances being the trusts created by wills and settlements, by which the control of certain land or certain funds is given to one or more persons for the benefit of another person or other persons. Another instance of an equitable right is the right of the mortgagor to redeem the mortgaged property, the legal right to which is vested in the mortgagee.

(2) Amongst doctrines specially belonging to the sphere of equity may be mentioned the rule that a debt may be assigned; that, in the absence of an express stipulation or necessary implication, time is not considered as of the essence of a contract, that penalties named in contracts cannot be enforced unless they partake of the nature of liquidated damages, etc.

(3) The administration of trusts and of the estates of deceased persons involves protracted inquiries and the taking of accounts, etc.; for this purpose a special procedure and a special machinery has been developed in the courts of equity, which were the only courts which had to deal with matters of this nature.

(4) Among the special kinds of relief which could be obtained with the assistance of the courts of equity, the right to claim specific performance of contracts for the sale of land, and the right to claim injunctions, *i.e.* orders restraining the opposite party from doing certain acts injuring the rights of the plaintiff, are the most important. The courts of equity, in granting relief of this kind, were supplying a material defect in the administration of justice, as in the courts of common law; the only remedy in the case of breach of contract or injurious acts consisted in pecuniary damages, which in many cases did not adequately compensate the injured party. The power of the courts of equity to enforce their decrees by the imprisonment of disobedient parties materially helped them in the exercise of this jurisdiction.

The Judicature Act of 1873 has merged the equity courts and the courts of common law into one high court, and the rules of equity are now administered in all courts; but as they are derived from a different source from the common law rules, and have always been treated as a separate system, the distinction is still kept up, though it has no longer any practical meaning. The matters which are specially fitted for the procedure of the chancery court, have, however, been assigned to a special chancery division which is organised in a manner appropriate to the proceedings required with regard to them.

[Spence, *Equitable Jurisdiction.*—H. A. Smith,

Principles of Equity. For the place of equity in systems of law generally, and its importance in the evolution of society, see Maine, *Ancient Law*.] E. S.

EQUITY OF REDEMPTION. The right that a mortgagor has to recover, on payment of principal, interest, and costs, a mortgaged estate which has under the mortgage deed become the property of the mortgagee owing to the failure of the mortgagor to pay the principal and interest at the time agreed on. The right resembles real estate inasmuch as it will descend to the mortgagor's heirs. It is alienable, and may itself be mortgaged.

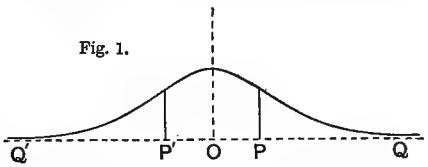
[*The Principles of Equity*, by E. H. T. Snell, London, 1892.] J. E. C. M.

EQUITY TO A SETTLEMENT. When a husband had to resort to a court of equity in order to reduce into possession property of his wife, the court compelled him to make a settlement of a portion, usually one half, of such property on the wife and children.

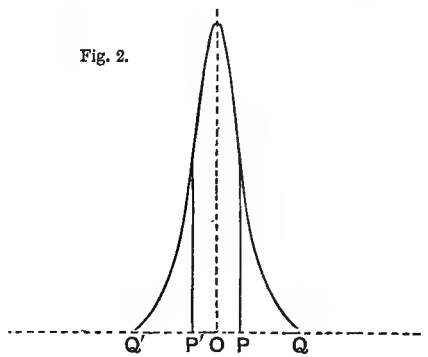
[*The Principles of Equity*, by E. H. T. Snell, London, 1892.] J. E. C. M.

ERROR EXCEPTED. These words are frequently inserted at the end of a statement of account, and are intended to show that the accounting party wishes to reserve the right to make further claims in case any error should subsequently be discovered in the account. E. S.

ERROR, Law of. When an average of a set of statistics is taken, the deviation of any one of them from the average is sometimes called an *error;* and the arrangement of the group about its mean, a *law of error*. A particular arrangement, which under certain frequently-realised conditions arises, is designated as *the* law of error. According to this law the figure which is likely to occur most frequently is the one which forms the average; the others are grouped symmetrically above and below the average; becoming less frequent as they are more distant from that central magnitude. In the exact language of symbols, if x_1, x_2, etc., are the quantities averaged, and X the average, the number of quantities comprised between x and a neighbouring value $x+\Delta x$ is approximately $= n\,\Delta x \frac{1}{\sqrt{\pi c}} e^{\frac{(X-x)^2}{c^2}}$; where π and e are the well-known constants 3·1415 . . ., 2·718 . . .; and c is a constant proper to the group under consideration. This arrangement is represented by the curve $Y=\frac{n}{\sqrt{\pi c}} e^{-\frac{(X-x)^2}{c^2}}$; the number of observations in the neighbourhood of any point in the axis of x being proportioned to the ordinate at that point; and the number of observations comprised between two values of x being equal to the area intercepted by the ordinates at those two points, the curve, and the axis x. Two illustrations of this curve are given in the annexed diagrams. The curve is spread out, as in Fig. 1, when the constant c is



large; it is gathered in, as in Fig. 2, when the



constant c is small. The constant c being ascertained for any group of statistics, we are able to predict what proportion of the group will probably be comprised between limits defined in terms of that constant. Thus half of the group is likely to be comprised between the limits X − ·4769 . . . c and X + ·4769 . . . c; or, in other words, it is as likely as not that an observation taken at random will be distant from the average X by an interval greater than ·4769 . . . c; which multiple of c is accordingly called the *probable error*. Again the greater part of the group is comprised between the limits X − 2c, X + 2c; the odds are more than 200 to 1 against any observation being at a distance greater than 2c from the average. The odds are 50,000 to 1 against the distance of any observation from the average being greater than 3c. The points P and Q (P' and Q') in the figures are intended to represent the "probable" and what may be called the *improbable error* (2c or more).

The condition under which the law of error is fulfilled is that each of the things averaged is dependent in the same way upon (the same function of) a great number of independently variable elements. For example add together ten or more digits obtained thus: the first is the *first* decimal place in any constant, *e.g.* π, the second addendum is the first digit in any other constant, *e.g.* e, and the remaining eight constituents of the sum are the *first* digits in almost any other unconnected constants. Form another

sum of ten digits by taking the *second* decimal place in each of the ten constants; and so on. The set of sums thus formed will group themselves according to the law of error; the average being 45, and the constant c being $\sqrt{165}=13$ nearly. About half the group will be found between $45-6$ (*i.e.* 39) and $45+6$ (*i.e.* 51) since $\cdot 477\sqrt{165}=6$ nearly. A very small proportion of the group—less than a two-hundredth part—may be expected to occur outside the limits 45 ± 26. ($26=2\times\sqrt{165}$ nearly). If the number of elements entering into each of the figures averaged had been greater than ten, *e.g.* twenty, the "probable" and the "improbable" error would have been greater *absolutely*, namely 10 and 36 respectively; but less *relatively* to the average, now 90. Similar consequences would follow if, instead of a simple *sum*, we had employed almost *any function*.

There is reason to believe that the condition which has been indicated is frequently fulfilled; and the law of error has been observed to prevail in extensive classes of phenomena, which may thus be summarised:—

1. Repeated observations of one and the same physical quantity.

2. Shots fired at the same object.

3. A series of numbers each of which is obtained by taking at random a batch of say n balls out of a bag containing white and black balls mixed up in a certain proportion, and noting the number of whites in each batch of n balls; or a series obtained by tossing coins or dies and noting the number of heads or aces; and similar series.

4. Measurements of the organs of numerous specimens of a natural species.

5. Statistics of social phenomena which do not present a *progressive* character, *e.g.* the number of births, deaths, or marriages or the *rates* of the same, or the ratios between the male and female rates; observed at places or times not materially distant from each other.

Illustrations of the third and fifth classes are given in the accompanying tables, the materials of which have been taken from Professor Westergaard's *Theorie der Statistik*. In Table I., column 1, was obtained from 100 batches of balls; each batch numbering 100 balls, which were taken at random from a bag containing black and white balls in equal proportions; the number of white balls in each batch having been noted, the number of these numbers comprised between two limits, which are defined by a multiple of the constant c, forms an entry in column 2. The corresponding limits are given in column 1. Thus twenty-five of the observations occurred between the limits $50-\cdot 3\frac{c}{\sqrt{2}}$ and $50+\cdot 3\frac{c}{\sqrt{2}}$, or 47 and 53, since the value of c is here $\sqrt{2}\times 10$; 40 of the errors occurred between $50-\cdot 5\frac{c}{\sqrt{2}}$ and $50+\cdot 5\frac{c}{\sqrt{2}}$, or 45 and 55; and so on. Column 3 similarly registers the arrangement of the statistics obtained from 750 batches of lottery tickets—each batch numbering 100—by noting the number of prizes in each batch (the average being 16, and the constant c being 5 nearly).

Table I.

Table showing the correspondence between fact and theory in the arrangement of the numbers of white balls in batches of 100 balls each drawn at random from a bag; and of prizes in batches of 100 tickets drawn at a lottery.[1]

Limits above and below the average.	Percentage of errors within limits.		
	Observed.		Calculated.
	Balls drawn from bag.	Tickets drawn at lottery.	
1	2	3	4
$\cdot 3\frac{c}{\sqrt{2}}$	25	23	*23*
·5 ,,	40	36	*36*
·7 ,,	50	48	*49*
1·1 ,,	70	67	*69*
1·5 ,,	85	83	*82*
2·1 ,,	95	95	*93*

These results of observation are to be compared with the predictions of theory which are contained in column 4.

Table II.

Table showing the correspondence between fact and theory in the proportion of male to all births for nineteen years in Italy.[2]

Limits above and below the average.	Number of errors within limits.	
	Observed.	Calculated.
1	2	3
$\cdot 3\frac{c}{\sqrt{2}}$	2	*5*
·5 ,,	7	*7*
·7 ,,	9	*9*
1·1 ,,	12	*12*
1·5 ,,	16	*14*
2·1 ,,	17	*16*

[1] Westergaard, *op. cit.* p. 67.

[2] See Westergaard, *op. cit.* p. 39. The first column differs from his only in notation; the second column is the same as his; the third column is calculated from the second column of his table at p. 67.

In Table II., the first column gives limits defined by the constant c as before; the second column gives the arrangement of errors obtained by comparing the proportion of male births to all births, male and female, in Italy for each of nineteen years with the average proportion for the whole period; the third column gives the theoretical arrangement.

The applications of the law of error with which we are here concerned relate partly (I.) to practice, and partly (II.) to the investigation of causes.

(I.) It is useful, when employing an average obtained from statistics, *e.g.* a death-rate, or an index-number, to have the means of estimating the extent to which the figure in the case with which we are dealing is likely to differ from the average obtained in past experience. It is useless to calculate the average to a number of decimal places not warranted by the "probable error" to which the figure is liable.

(II.) Under the second head two cases may be distinguished: (a) where the analogy of simple games of chance holds good; the constant c being that which would be obtained if the statistics were of the sort which forms our *third* class of phenomena above; and (b) where the constant is not such.

(a) In the first case we have the advantage of knowing that the given group cannot be broken up into two, or more, with widely different averages; that the analysis which is a principal object of the scientific statistician has been already pushed almost up to its limit. Our statistics cannot be like batches of balls taken from bags in which the proportion of white to black is very different; but rather are analogous to the successive numbers of white balls occurring in batches of the same size taken at random from the same bag. It would appear hopeless therefore to trace by ordinary induction the causation of any particular event of this character. It is only crazy gamblers who pretend to predict the "runs" in games of pure chance. But we are not precluded from applying the law of error to detect delicate differences, such as may exist between a perfect and a slightly-loaded coin. Take for example the observation that the percentage of male compared with female births for more than a million *plural* births (of twins or triplets) in Prussia during a certain period of years was 104·447 (males to 100 females); whereas the corresponding ratio for all births (single as well as plural) was 106·305; the observation on which this average is based numbering several millions. Given these numbers, and knowing as we do that the phenomenon belongs to class (a), we are able to determine the constant c; which proves to be nearly ·3. Thus the difference between the two averages compared, viz. 1·858, is about six times the constant, and accordingly (see above par. 1) the odds against the observed difference in the averages being due to accident and not to a real cause which may be expected to continue acting—are many times more than 50,000 to 1 (Duesing). We have obtained, at a stroke, a degree of evidence in favour of a law which otherwise could only be obtained by a laborious analysis of the returns. By parity of reasoning it is found that in times and places where the absolute number of births is large the proportion of males is small (*ibid.*).

(b) This summary method may be employed also in the second case (where the analogy with games of chance does not hold good); but not in such a clear light of foreknowledge as to the character of the causes under investigation.

Besides the exact and direct applications of the law of error, it also affords what may be called "regulative ideas" to the statistician; supplying the *rationale* of many received maxims: that *ceteris paribus* an average is more worth the greater the number, and the less the divergence, of the returns averaged; that a few accurate returns may be better than many loose ones.

[For a general exposition, at once simple and accurate, of the law of error, see Venn, *Logic of Chance*, third ed. 1888, chaps. xviii. and xix. See also Jevons, *Principles of Science*, chap. xvii.—Bertillon, art. "Moyenne," *Dictionnaire Encyclopédique des Sciences Médicales*.—Quetelet, *Physique Sociale*. For the conditions under which the fulfilment of the law may be expected, Glaisher, *Memoirs of the Astronomical Society*, vol. xl. p. 104.—Galton, *Philosophical Magazine*, 1875, "Statistics by inter-comparison."—Edgeworth, *ibid.* 1892, "The Law of Error."—For the *a posteriori* proof, that the law is fulfilled, see Galton, *Natural Inheritance*.—Westergaard, *Grundzüge der Theorie der Statistik*, chap. iii.—Edgeworth, "Empirical proof of the law of Error," *Phil. Mag.*, 1887.—For the application of the law to practice, Dormoy, *Théorie mathématique des assurances sur la vie*. For the application of the law to induction, (a) where the analogy of games of chance holds good, Westergaard, *op. cit.*—Lexis, *Massenerscheinungen*. — Duesing, *Das Geschlechtsverhältniss in Preussen*; (b) in general, Edgeworth, *Journal of the Statistical Society*, Jubilee Volume, 1885, "Methods of Statistics," *ibid.* December 1885, "Methods of Determining Rates." Many of these writers throw light on other parts of the subject besides those with special reference to which they have been cited. Several other authors might have been cited. Merriman has published an immense list of writers on the cognate subject of the *Method of Least Squares*, many of whom have touched on the *law of error*, and some on its applications to social phenomena (see PROBABILITIES; STATISTICS).] F. Y. E.

ESCHEAT (historical) was a feudal term introduced by the Normans into England, and applied to the reversion of land to the lord. The ordinary cause of such reversion was the failure of heirs, when the whole estate passed into the hands of the lord. If the heir was a

minor, the phrase was *escæta cum hærede*, when the necessities of the heir and other children were paid for out of the estate and the surplus only went to the lord, until the heir, on reaching his majority, paid a relief and obtained seisin. Escheat also took place in cases of treason or felony. If the criminal was a tenant-in-chief, the whole of his property reverted to the crown; but if he was a sub-tenant, his movables only fell to the crown, while the real estate passed to the immediate lord.

[*Dialogus de Scaccario*, ii. x.] R. L.

Escheat (modern law), takes place where a person dies intestate and without an heir. The lands of such a person go to the feudal lord, but, as in the case of freehold land the right of mesne lords can in our days be established but rarely, such land generally goes to the sovereign as lord paramount. Copyhold land goes to the lord of the manor, and § 4 of the Copyhold Act provides that the right of escheat is to continue after enfranchisement; enfranchised copyhold land, though otherwise of the nature of freehold land, does not therefore escheat to the crown, but goes to a private person. Formerly the lands of felons were subject to the right of escheat, but an act passed in 1870 has repealed this rule. On the other hand the Intestate Estates Act of 1884 has made certain rights as to real property subject to escheat, which were not so subject before. The same act has enabled the crown to waive its right in certain cases. The procedure which takes place to inquire as to the right of the crown has been simplified by the Escheat (Procedure) Act of 1887.

The right of the state to acquire the property of a person dying without relations or a will exists in most countries independently of feudal rules, and seems justified by reason and convenience.

[Bentham, J. S. Mill, Godin, and other reformers, have proposed to narrow the rights of intestate succession (*i.e.* to extend escheat) in order to correct, to some extent, the unequal distribution of wealth.] E. S.

ESCUDO. The name of the Spanish half dollar.

Gold and Silver Coins as follows:

Metal.	Denomination of Coin.	Fineness.	Weight.	Value.	
				In gold 916·6 fine at £3:17:10½ an ounce.	In gold francs, 900 fine.
			grains.	£ s. d.	francs.
Gold	10 Escudos (or Doubloon)	900	129·44	1 0 7½	26·0
	4 Escudos	900	51·78	0 8 3	10·4
	2 Escudos (or Dollar)	900	25·89	0 4 1½	5·2

Metal.	Denomination of Coin.	Fineness.	Weight.	Value.	
				In silver 925 fine at 5/6 an oz.	In silver francs, 900 fine.
			grains.	s. d.	francs.
Silver	Escudo (or ½ Duro or Dollar)	900	200·30	2 2½	2·6

These coins have not been struck for circulation in Spain since 1868, when the system of pesetas (francs) was introduced. Similar coins, including a doubloon of eight escudos, are current in the Philippine Islands (see DOUBLOON). F. E. A.

ESCUSADO, the name of the portion of ecclesiastical tithes made over in 1567 by the Pope to the crown of Spain. E. Ca.

ESSART, EXART, sometimes also called ASSART. A mediæval term applied to a portion of forest land cleared and brought into cultivation. To make essarts was technically a breach of the forest law, punishable by fine. These fines, with the yearly rents levied on the essarted lands, which the maker of the essart was usually allowed to keep under cultivation, formed a considerable item in the revenues of the royal and other lords of forests in mediæval England. These rents would appear to have been fixed at the highest rate that could be maintained, a rate which will be found to be often several times as great as that paid by free or even customary tenants for other land in the same neighbourhood. In spite of these high rates, however, fresh essarts were made almost every year in England. The forest of Wirrall in Cheshire, for instance, was entirely under cultivation before the death of the Black Prince, who, in his capacity of Earl of Chester, by a formal charter of disafforestment, put his seal to the work of reclamation. The word *essart* has been variously derived from the old French *assortir*, to make smooth, or one of the low Latin terms, *exertum*, rooted up, *sarrire*, to weed, or *exarare*, to plough up.

[Manwood, *Forest Law*, London, 1596, etc.—Ducange, *Glossarium Mediæ et Infimæ Latinitatis*, ed. nova a L. Favre, Paris, 1884.—Forest accounts among the ancient records of the exchequer in the Public Record Office.] A. H.

ESTATE. A so-called owner of land has, according to English law, no absolute right of ownership; all that he has is an interest varying in extent and duration, and known in technical language as an "estate" in the land. The largest estate known to the law is an "estate in fee" (fee simple), which gives the owner as complete rights of enjoyment and alienation as the nature of the property will admit; an estate tail (see ENTAIL), being convertible into an estate in fee—by the tenant alone, if in

possession, and otherwise by him jointly with the tenant for life—confers rights nearly as complete. An estate for the life of the tenant, or for the life or lives of another person or other persons, gives the tenant the privileges of ownership during his life or during the life or lives of such other person or persons; but a tenant for life—unless the estate is conferred upon him "without impeachment of waste"—is not allowed to pull down buildings, cut timber, or open mines. An estate for the life of another person is called an "estate pur autre vie." Estates in fee or in tail, and estates for life, are called "freehold" estates, estates for a definite number of years, however large the number may be, are "leasehold," also called "less than freehold" (see LEASEHOLDS). The word estate is also used as a comprehensive name for the assets of a bankrupt or of a deceased person. In the latter case a distinction is made between freehold land and houses (real estate) and other property (personal estate).

E. S.

ESTATE DUTY. See DEATH DUTIES.

ESTCOURT, THOMAS (end of 18th and early 19th century). Thomas Estcourt sat in parliament as member for Cricklade from 1784 to 1806. In 1804 he published *An account of an Effort to Better the Condition of the Poor in a Country Village* (*Long Newton*) *and some Regulations suggested by which the same might be extended to other parishes of a similar description.* The work was printed by the board of agriculture. Estcourt states that in 1800 arrangements were made for letting to any cottager a small quantity of land at a rent of £1 : 12s. an acre, the land to be forfeited if not properly cultivated, or on the receipt of parish relief other than medical. He states that the offer was largely accepted, and that the scheme greatly decreased the poor-rate in the village.

C. G. C.

ESTERNO, PHIL., COMTE D' (1805-1883), born at Dijon, died at Paris. Esterno's life was mainly devoted to agriculture and to political economy. The first work of his which caused him to be known as an economist was entitled, *Des banques départementales en France*, 1 vol. in 8vo, 1838. In this Esterno argued in favour of departmental banks, to be established in a good many towns, and at Dijon in particular. This was at a time when the government, urged on by a spirit of centralisation, were hostile to institutions of this description.

In 1840 Esterno took part in a discussion instituted by the Academy of Moral and Political Sciences, on the signs and causes of poverty in different countries. BURET (*q.v.*) won the prize. Esterno's paper was rejected because, according to the report, "it was not an economic essay which was wanted." This work, printed in 1842, under the title of *La misère; de ses causes, de ses effets*, in 8vo, reflected the ideas of Malthus, while Buret, on the other hand, had allowed sentiment to overpower reason.

During the same year (1842) Esterno assisted as secretary, in conjunction with P. Rossi, who was president, in founding at Paris a society for promoting political economy (*Société d'économie politique*), an association which only lasted a few months, but was a forerunner of the society now known under the same name.

In 1867-68 Esterno published another work, *Des privilégiés de l'ancien régime en France et des privilégiés du nouveau*, 2 vols. in 8vo. In this work the author argued, in a brisk and original style, in favour of agriculture, which was put too much on one side by the privileged persons under the new regime, the moneyed classes, as distinguished from the landed proprietors, notwithstanding the untrustworthy titles of some of their institutions, *Le Crédit agricole*, for example. Before this date (1867-1868), and later on, Esterno strove, on behalf of the agricultural interest, against those artificial monopolies which, even to this day, have arrested the development of agriculture in France. He thus became deeply interested in works of irrigation, and it is to him and to his energy, though he never allowed his name to appear, that the adoption of the regulations of 29th April 1845 and 11th July 1847 (*lois d'Angeville*) is due.

Esterno's mental activity led him to occupy himself with other subjects with which we are not concerned here. His intelligence, his energy, and his scientific devotion enabled him to render them interesting to others. He was a vice-president of the second *Société d'économie politique.*

A. C. f.

ESTIMO. The revenue of Florence in the flourishing days of the republic was mainly derived from indirect taxes, which produced some 300,000 florins a year. But in times of war, which became frequent in the 14th century, this income was insufficient, and it was supplemented either by direct taxes or by compulsory loans (*prestanze*). Both taxes and loans were supposed to be based upon an *estimo*, or government valuation of property, and hence the term *estimo* comes to be applied to the exactions themselves. The earliest *estimo* was formed in 1288, and seems to have referred only to real property. Another assessment took place in 1327, when a foreign judge was appointed to determine the wealth of each individual by the secret testimony of seven of his neighbours. But the attempt to provide a regular basis for direct taxation proved a failure in the 14th century. An *estimo* soon became obsolete as property rapidly changed hands, and a charge upon real property alone pressed heavily upon the noble families and the peasants of the country, while the wealthy burghers escaped.

For the most part the forced loans were arbitrarily assessed by the existing government, and one great reason for the Florentine greed for office, which introduced the system of lot, was the desire to escape taxation. When the CIOMPI (*q.v.*) rose in revolt in 1378, one of their demands was that no loan should be levied without an *estimo*, but their subsequent defeat prevented any change being made. The discontent excited by arbitrary and unfair assessment forced the government in 1427 to introduce the CATASTO (*q.v.*), which was only a new name for a thorough *estimo* of real and personal property including income. But this great reform was abandoned by Cosimo de Medici in 1441, when the old arbitrary assessments, formerly maintained to favour the wealthy burghers, were revived to relieve and conciliate the poorer classes. The Medici from this time introduced the principle of progressive taxation, and, as Guicciardini says, used the taxes instead of the dagger to ruin their opponents.

[Canestrini, *La Scienza e l'Arte di Stato desunta dagli Atti officiali della Repubblica Fiorentina e dei Medici* (only one volume of this great work was published).—Napier, *Florentine History*, vol. iii. p. 117.—Perrens, *Histoire de Florence.*] R. L.

ESTOPPEL. A term used in connection with the rule of law, according to which a person who, by statements or conduct, causes another person to believe in the truth of a certain matter of fact, with the intention of inducing him to act upon it, cannot, in any dispute concerning the matter in question, be allowed to assert that the state of things which he represented to be in existence, did not, in fact, exist; thus, for instance, a person, by accepting a bill of exchange, induces the holders to assume that the drawer was of full age, and otherwise capable to draw a bill, and he is therefore "estopped" from denying the drawer's capacity (Bill of Exchange Act, § 54 [2]). Estoppel by conduct is in certain cases also called "estoppel by negligence," *e.g.* if a person by the careless filling in of a cheque enables a fraudulent holder to alter the amount, he is estopped from denying that he drew the cheque for the full amount, as by his negligence he has allowed the banker to think that he has done so. Estoppel by statement or conduct is in the older law books called "estoppel by matter in pais," and distinguished from "estoppel by deed" and "estoppel by record." "Estoppel by deed" prevents a party to a deed from denying any fact mentioned in the same by way of recital or otherwise. "Estoppel by record" precludes a party to an action, or his successor in title, from denying any fact established by the decision in the action. The fullest statement on the law of estoppel is contained in the notes to the Duchess of Kingston's case in Smith's *Leading Cases*, vol. ii. E. S.

ESTOVERS (derived from the same root as the old French word *estovoir* = to be necessary), also called "Bote," is the right of a tenant for life, unless restrained by agreement, to take the necessary wood from the estate for the use or furniture of a house or farm. "Common of Estovers" is the right of a commoner to cut wood (see COMMONS). E. S.

ÉTATS GÉNÉRAUX, THE, or States General of France, were, under the old monarchy, the national representative assembly of the kingdom, composed of elected members of the three orders, the noblesse, the clergy, and the third order or state (*Tiers État* or *bourgeoisie*), but no fixed rule was ever followed for their election and assembling. Their first authentic meeting was summoned, 1302, by King Philippe le Bel, to assist him in his struggle against Pope Bonifacius VIII.; after this date they were convoked at irregular and often very protracted intervals, whenever the royal finances were in a state of extreme distress. In 1357, during the captivity of King John in England, they vainly tried to give a constitution to the kingdom. The *Etats Généraux*, which must not be confounded with the *Assemblées des Notables*, were at all times steady and consistent upholders of the theory that no tax could be valid without their assent; the monarchy never contested this doctrine, but never followed it in practice. The *États Généraux* of 1614 were the last before the revolution of 1789.

Jallifier's *Histoire des États Généraux* (1 vol. Paris, 1888), and M. Georges Picot's exhaustive *Histoire des États Généraux considérés au point de vue de leur influence sur le gouvernement de la France* (1355-1614).] E. Ca.

ETHEL. See ALOD.

EVANS, DAVID MORIER (1819-1874), was born in Wales. He treated economic subjects from a journalistic point of view, aiming rather at giving an accurate narrative of the successive phases of economic crises and the like than at tracing their hidden causes. In his own words he was a man of "facts and figures."

Besides numerous contributions to the *Bankers' Magazine*, which he edited for some years, the *Bullionist*, and the *Stock Exchange Gazette*, Evans wrote *The Commercial Crisis, 1847-48*, London, 1848-49.—*The Annual Commercial Register*, London, 1850.—*Fortune's Epitome of the Public Funds*, London, 1851-56.—*Facts, Failures, and Frauds*, London, 1859.—*The History of the Commercial Crisis, 1857-58, and of the Stock Exchange*

Panic, 1859, London, 1859.—*Notes on Speculation*, London, 1864.

[See *Dictionary of National Biography*, London, 1888, *Times* for 2nd January 1874.] A. H.

EVANS, THOMAS (end of 18th and early 19th century). In 1798 Thomas Evans was acting as secretary to the London Corresponding Society, and was imprisoned for nearly three years on a charge of treasonable practices. He afterwards acted as librarian to the Spencean Society, and published the work whose title is given below. The book contains the usual Spencean doctrines, advocates the nationalisation of the land as the only remedy for the prevailing distress, and denounces Malthus as the "hireling of pagan landlords."

Christian Policy, the Salvation of this Empire, "being a clear and concise examination into the causes that have produced the impending national bankruptcy, and the effects that must ensue unless averted by the adoption of the only real and desirable remedy" (2nd ed., 1816). C. G. C.

EVERETT, ALEXANDER HILL (1792-1847), was born at Boston, Massachusetts. He graduated with the highest honours at Harvard; engaged in the diplomatic service, and from 1825 to 1829 served as U.S. minister to Spain; returned to Boston and became editor and proprietor of the *North American Review;* from 1830 to 1835 was in the Massachusetts Legislature; in 1840 undertook a diplomatic mission to Cuba; and in 1847 was engaged in a similar errand in China, when he died at Macao. His writings cover a wide range in history and literature. Of economic interest is the following: *New Ideas on Population with Remarks upon the Theories of Malthus and Godwin*, Boston, 1823, pp. 125 (translated into French). In opposition to the Malthusian theory Everett argues that an increase of population is a cause of abundance and not of scarcity, since it develops the new elements of skill by which the same quantity of labour is applied with greater effect. Although the population of Great Britain doubled in the 18th century, improvements in the mode of applying labour increased its productiveness probably a thousand times. Everett, by travel and intercourse with eminent men in Europe, enjoyed opportunities possessed by few of the earlier American writers on economic subjects. He had an interview with Malthus, carefully discussing the points at issue. The latter suggested to Everett that his views were similar to those of Mr. S. Gray in the *Happiness of States* (1815). The Malthusian theory was also discussed in a correspondence between Everett and Prof. George Tucker in the *Democratic Review*, vol. xvii. pp. 297-310, 379-391, 438-444, and vol. xxi. pp. 397-410.

[For a summary of Everett's views, *v. Dem. Rev.*, vol. x. p. 466, where there is a sketch of his life until 1840. To the *North American Review* he contributed many essays, among them "M'Culloch's Political Economy" (1827), xxv., 112; "Political Economy" (1829), xxviii., 368; "British Opinions on the Protecting System," xxx., 160; "American System," xxxii., 127; "Phillip's Manual of Political Economy," xxxii., 215; "The Laws of Population and Wages," xxxix., 68; "Rae's Political Economy," xl. 122. Everett was a protectionist; and in 1833, as chairman of a committee at the Tariff Convention in New York, prepared a memorial to Congress in reply to the memorial prepared by Gallatin for the Free Trade Convention at Philadelphia. He advocated reforms in the banking system in two articles on "The Currency" in *Boston Quarterly Review*, July 1839; January 1840.] D. R. D.

EVERETT, GEORGE (*fl.* 1693-1698), Shipwright, appears to have occupied some position of importance in the government dockyards. He was also employed by the commissioners of customs in the detection of smuggling. He published (1) *The Pathway to Peace and Profit; or Truth in its Plain Dress*, etc., London, 1694, 8vo. (2) *Encouragement for Seamen and Mariners, in two parts*, etc., London, 1695, 4to. The first of these pamphlets embodies certain proposals, which Everett laid before the lords of the admiralty in February 1694, for securing greater economy and efficiency in the dockyards. If they were adopted he promised an annual saving of £100,000. The second pamphlet was directed against the abuses of the system of impressment for the sea service. His object appears to have been to devise a system which should at the same time secure a constant supply of sailors for the royal navy and get rid of the expense to the government, and "injury to the subject," of the system then in vogue. Amongst his suggestions may be noticed the registration of all seamen and mariners, fixed pay days, abolition of the sale of all offices in the navy, and a strict application of the principle of promotion by merit, an additional allowance for seamen disabled in the public service, the payment to the family of the sailor of six months' wages for every nine months he should be at sea, etc. Everett's pamphlets are of no theoretical interest, but they throw much light on the conditions of labour in the dockyards and the sea service at the end of the 17th century.

[Watt's *Bibl. Brit.*—*Cat. of Treasury Papers*, xxxvi. 38; liv. 29.] W. A. S. H.

EVELYN, JOHN, F.R.S. (1620-1706), the author of the famous *Diary*, published several works of economic interest. Amongst these may be mentioned (1) *Sylva, or a Discourse of Forest Trees and the Propagation of Timber*, etc., London, 1664, fol., 5th ed. 1729. A new edition with notes by A. Hunter was published in 1776; 4th ed. 1812. (2) *Navigation and Commerce, their Origin and Progress. Containing a Succinct Account of Trafficke in General: its Benefits*, etc., London, 1674, 8vo.

(3) *Terra: A Philosophical Discourse of Earth, Relating to the Culture and Improvement of it for Vegetation, and the Propagation of Plants*, etc., London, 1676. New edition, with notes by A. Hunter, 1778. (4) *Numismata: A Discourse of Medals, Ancient and Modern*, etc., London, 1697, fol. Evelyn also translated several French works on horticulture.

[M'Culloch's *Literature of Pol. Econ.*, 146, 212. For a full account of Evelyn's life and writings see *Dictionary of National Biography*.]

W. A. S. H.

EVELYN, JOHN (*fl.* 1830), of Edgbaston, Birmingham, was the author of *Co-operation: An Address to the Labouring Classes on the Plans to be pursued in Conducting Trading Unions*, 1830, 8vo. By "trading unions" Evelyn meant co-operative societies.

EVOLUTION. See DEVELOPMENT.

EVICTION. The recovery of possession of land whether by simple re-entry or by legal process is often termed eviction. Eviction is substantially the same as EJECTMENT. The term is rather popular than technical. F. C. M.

EX. ALL. A well-known phrase on the stock exchange, used to signify that a security quoted or dealt in conveys to the buyer no rights in the shape of dividends or drawings or issue of new stock or other contingent advantages. The word ex. is simply short for excluding (see EX. DIVIDEND, EX. DRAWING, EX. NEW). A. E.

EXAMPLES. Examples in economics, as elsewhere, are simply cases, real or fictitious, or partly both, supposed to embody a general principle. They may be classified as follows: (1) *Real but general*, as Ricardo's hunters (*Principles*, ch. i. § i.), and Ad. Smith's bricklayers, carpenters, and men of letters (*Wealth of Nations*, I. x.). The examples are taken from a known genus but not from known individuals. Where the genus is perfectly well known, no cavil is possible. Ad. Smith's illustration of division of labour could hardly have been improved by a reference to a particular pin-making establishment in a specified place. But, in exposition, the more concrete the genus the more telling the example; *e.g.* 'blacksmith' seems nearer life than 'workman.' (2) *Real and particular*, as in Cairnes's illustration of the theory of international trade from the Australian gold discoveries (see CAIRNES). Adam Smith, where he does not use the real and general, uses the real and particular, and falls back on fiction only for his similes (as "the highway," "the waggonway through the air," the "wings," and "the pond and the buckets," *W. of N.*, II. ii.), or his metaphors ("wheel of circulation," "channel of circulation.") Ricardo and his immediate followers have preferred, as a rule, (3) *Fictitious* examples. These may be illustrations of which the component elements are generically well known, as even the favourite "man on the desert island," but the combining of the elements is the work of the writer, and is more or less arbitrary, as De Quincey's "man with the musical box on Lake Superior," and Bastiat's "plank and plane." There is also a risk that the construction of the example may involve a begging of the question to be proved. "Suppose that there are but two nations in the world living side by side, with a population of one million souls in each" (Barbour, *Bimetallism*). "My object was to elucidate principles, and to do this I imagined strong cases that I might show the operation of those principles" (Ricardo, *Letters*). There is no necessary fallacy in this method of exposition any more than in illustrating the law of gravitation by the action of bodies *in vacuo*. Concrete cases must necessarily exemplify much more than one principle, and, even if they suggested a particular generalisation, they may perhaps not clearly illustrate it without a fictitious simplification. The lawfulness of such a method of exposition or, it may be, of proof is discussed elsewhere (see DEDUCTIVE METHOD). J. B.

EXCAMBION is the technical term used in Scotch law to designate the contract whereby one piece of land is exchanged for another. The persons effecting the exchange are known as excambers. Each party gives the other such a warranty of title that, if evicted from the land which he has received, he and his heirs can recover from the other party and his heirs the land which he originally gave. When lands burdened with debt are disponed in excambion, they are freed from that debt and are thenceforward burdened with the debts, if any, formerly affecting the land given in exchange. Tenants in tail have a statutory power of effecting such exchanges which now extends to one-fourth of the total value of the property entailed (see LAND).

[Bell's *Dictionary and Digest of the Law of Scotland*, edited by George Watson, Edinburgh, 1882, art. "Excambion," and the authorities therein cited.] F. C. M.

EXCHANGE.

Exchange, p. 758; Exchange, Value in, 759; Exchange, Value in (History of Theory), p. 762; Exchange, Usury (see Usury), p. 767; Exchange (as Bourse), p. 767: Exchange, Stock, p. 768; Exchange, Provincial Stock, p. 770; Exchange, Foreign, p. 770; Exchange, Foreign (Practical Working of), p. 772; Exchange between Holland and Dutch India, p. 773; Exchange between Great Britain and British India, p. 776; Exchange, Internal, p. 777; Exchange of Notes (Scotland), p. 778; Exchange Broker, p. 778; Exchanger, p. 778.

EXCHANGE, the voluntary giving of one commodity or service on condition of receiving another, is to a great extent the basis of the existing system of PRODUCTION and DISTRIBUTION (*q.v.*). If there were no exchanges, each article of separate property could be used only by its owner, and, excluding gifts, slaveholding, and

communistic arrangements, each man would have to subsist on what he could produce directly for himself, using his own and no one else's instruments of production. As things are, however, separate property is used in the main by those who are most capable of using it, whether they are its owners or not, and no one lives only on what he has himself produced but each lives on what has been produced by a vast number of other persons (see Adam Smith, *Wealth of Nations*, bk. i. ch. i. at end). This is the result of exchanges; owners of property allow others to use it because they can get commodities and services in exchange for the use of it, and men are able to devote themselves exclusively to one occupation because the products of that occupation can be exchanged for the products of other occupations. While production is thus largely dependent on exchanges, distribution, as the word is commonly understood, could not exist at all without them. The use of the word implies that the whole produce of all the workers is considered to be a joint or common produce which, after being produced, has to be divided or "distributed." If each man lived on his own patch of ground, using his own instruments, and receiving no help from any one either in commodities or services, each man's produce or income would obviously be quite distinct from that of every other person, and the conception of a joint produce requiring to be distributed would never have been formed. Individuals' incomes would vary, but the variations would be questions of production only, since each man's income would depend entirely on the amount he produced. Exchange being practised, questions of "distribution" arise because each man's income depends not only on how much he produces but also on the value of what he has to sell, *i.e.* on how much of certain other things he can get in exchange for a given quantity of his work or of the use of his property.

Adam Smith showed a very fair appreciation of the importance of exchange with regard both to production and distribution. He rightly attributed what he called the "division of labour," but what is now usually called the "division of employments," to the practice of exchange, and he did not treat of wages, profits, and rents, till he had discussed "the rules which men naturally observe in exchanging" goods (*Wealth of Nations*, bk. i. ch. iv.) Unfortunately, James Mill, to whom the common arrangement of English works on political economy is chiefly due, seems to have had no adequate conception of the importance of exchange. He spoke of it as if it were a mere incident which occasionally happens to commodities after they have been produced and distributed (*Elements of Political Economy*, Introduction), and when he endeavoured to improve upon J. B. Say's division of political economy into Production, Distribution, and Consumption, by inserting Exchange, or "Interchange" as he called it, he placed it not only after production, but after distribution also. M'Culloch returned to Say's arrangement, but J. S. Mill followed in his father's footsteps, treating exchange after distribution, and declaring distinctly that "exchange and money make no difference in the law of wages, in the law of rent, nor in the law of profits" (*Principles*, bk. iii. ch. xxvi., Contents). But so far is this from being the case that the very existence of wages, rent, and profits, including interest, is dependent upon exchange. The payment of any particular sum of wages, rent, or profits is a case of exchange, and every variation in wages, rent, and profits is a variation of value, wages being the value of work done, rent the value of the use of land, and profits, the value of the use of capital and of the capitalist's services (see Sidgwick, *Principles of Political Economy*, bk. ii. ch. i. § 2). Of writers since J. S. Mill, most have so far deviated from his arrangement as to place "exchange" before "distribution," *e.g.* Walker, (*Political Economy*), or, with Profs. Sidgwick and Marshall, to treat exchange and distribution as too intimately connected to be treated separately (see DISTRIBUTION). E. C.

EXCHANGE, VALUE IN. Value in exchange, or exchangeable value, denotes a ratio of exchange—"the ratio of the number of units of one commodity to the number of units of another commodity for which it exchanges"; as Jevons particularly clearly points out (*Theory of Political Economy*, ch. iv.), and most authorities admit. The unsettled question is: What are the circumstances which cause the ratio to be what it is? "Utility and difficulty of attainment," answers Mill (bk. iii. ch. ii.), and similar terms are used by almost all economists, but in various shades of meaning, and with different emphasis on each of the two factors. The confusion is aggravated by the not sufficiently noticed circumstance that the operation of the two causes, utility and difficulty, is different in different classes of transactions. It is proposed here to discriminate those essentially distinct cases; mapping out and partially exploring the ground, which may be more fully investigated under the head VALUE.

A convenient tripartite division—Two-sided monopoly, one-sided monopoly (or one-sided competition), two-sided competition—is based upon the degree in which competition is present.

I. The action of competition is at a minimum where the dealers in two articles exchanged are single individuals, or bodies of persons actuated by one will, *e.g.* two governments negotiating a commercial treaty, or a trades-union coming to an agreement with a combination of masters about the rate of wages. The general principle in this case is that both parties will be gainers

by the bargain; in technical language the total utility (see CONSUMER'S RENT, DEMAND, DUPUIT, FINAL UTILITY), of each will be greater after than without the transaction. But to what extent each party will be gainers is not in general determinate; there is a sort of indefinite tract, a "spielraum" (Böhm-Bawerk), within which the point of equilibrium must be determined by other than purely economic considerations. Jevons well says: "the existence of combinations in trade disputes usually reduces them to a single contract bargain of the same [this] indeterminate kind. The men, for instance, ask for 15 per cent advance of wages all round. Rather than have a strike, it might be for the interest of the employers to give the advance, or for the men to withdraw their demand; *a fortiori*, any intermediate arrangement, would still more meet their views. But there may be absolutely no economic principle on which to decide the question. Mathematically speaking, the problem is an indeterminate one and must be decided by importing new conditions" (*State in Relation to Labour*, p. 154).

II. Where there is a monopolist, sole or corporate, on the one side, and on the other side an indefinite number of buyers, or sellers, competing with each other, the most general principle is that the monopolist will beat down the other parties to the point at which each of them is only just a gainer by his bargain; the addition to the total utility of each will be a minimum. The "law of indifference" that there should be one price in a market is not in general true of monopoly. The oppressiveness of the monopolist is modified by regard for his own future interests, as when an American railway company "builds up" a customer by giving him favourable terms, by fear of competition and of public opinion, and other considerations not here relevant (see MONOPOLY).

Mere convenience will often prompt the monopolist, instead of making separate terms in each transaction, as theoretically conceivable, to prescribe rates for classes of persons and goods. These charges are not in general proportioned to the cost incurred. Thus soldiers, in some foreign theatres, are admitted at a different rate from citizens; though the accommodation of the former may be as good as that of the latter. The differences between first and third class passenger fares, and between the rates for different kinds of goods, do not correspond to the outlay of the company in each case. For the object of the monopolist is to render his net profits a maximum; and this result will not in general be reached by apportioning charge to cost. True, if the cost changes, the arrangement most advantageous to the monopolist is apt thereby to be disturbed, and accordingly the charge will be in general altered, but not *proportionately* to the cost. Thus a tax on a monopolised article will in general increase the price, yet not equally with the tax, but, as it happens, by either more or less (Cournot, *Théorie Mathématique*, ch. vi.); the assertion which is often made that the charge will be unaffected by the tax is true only where the tax is a lump sum, not of a specific or an *ad valorem* tax.

In the case of monopoly then value is not measured by cost; but it is measured by utility: by total utility in case the monopolist takes the full advantage of his position; by final utility in the more usual case, where a rate is fixed for a class of commodities. In that case each consumer will go on purchasing up to the point at which it is just not worth his while to purchase another unit of commodity at the prevailing price.

III. The most general, or at least the most frequently treated, case is where there is unlimited competition on both sides of the market. This case may be subdivided into two: A, where value is not measured by cost of production, and B, where it is.

A, the first subdivision, corresponds to what Mill calls the "law of value anterior to cost of production, and more fundamental, the law of demand and supply" (see Mill, *Political Economy*, bk. iii. ch. xvi. § 1, and Prof. Marshall's criticism of the passage; *Principles*, p. 544, 2nd edition). This case may be subdivided into two: (1) where production, or at least reproduction is impossible, or may be left out of account; (2) where this abstraction is not admissible.

(A1). To this head belong market values—not only commodities which cannot be multiplied rapidly, but also those of which the quantity in existence cannot be diminished rapidly, namely the precious metals in circulation (Mill, bk. iii. ch. ii. § 5). Prof. Marshall gives an instructive general type of the "temporary equilibrium" of market value; unaffected by cost of production which requires a "long period" in order to influence value (*Principles*, bk. v. ch. ii.).

Other articles referred by Mill to this category are "ancient sculptures, pictures by old masters, rare books or coins, or other articles of antiquarian curiosity" (*Political Economy*, bk. iii. ch. ii. § 2). Compare Prof. Marshall's enumeration of articles in the case of which "there is no connection between cost of reproduction and price" (at the end of the chapter last referred to).

Mill adds to his list of such articles "building grounds in a town of definite extent (such as Venice), the most desirable sites in any town whatever . . . potentially all land whatever" (*loc. cit.*). It should seem that his limitation of the statement to the case of "countries fully occupied and cultivated," is unnecessary. But it is impossible here adequately to discuss all the difficulties which the subject presents.

It is a nice question whether it is proper to

include in this section (A1) the exchange of present goods for future (cp. Böhm-Bawerk, *Positive Theory*), the settling of the rate of interest. Mill says "this is evidently a question of demand and supply" used in the same as in the preceding cases (*Political Economy*, iii. ch. xxiii. § 1). It is usual, however, to regard the "sacrifice" incurred by postponing consumption as a mode of *cost;* and so not to be included in this section.

(A2) To this class belong "commodities of which, though capable of being increased or diminished to a great extent, the value never depends upon anything but demand and supply" in a sense opposed to determination by cost of production (Mill, bk. iii. ch. ii., last paragraph). Perhaps the most typical case under this head is international trade, where in Cairnes's phrase (*Leading Principles*, bk. iii. ch. iv. § 4), cost "controls" but does not "determine" value; in the terms above used with respect to monopoly *affects*, but does not *measure*, value. Thus suppose tea produced in China exchanges for cutlery made in England. There is no equation between the efforts and sacrifices of the Chinese and the British producer. For the *mobility* tending to produce that equation is wanting. As an additional verification that value is not proportioned to cost in this case, it may be observed that if the cost of production be altered, *e.g.* by an improvement or a tax, the value in the international market will be altered indeed, but not in proportion to the alteration of the cost (Mill, bk. iii. ch. xviii. § 5, and bk. v. ch. iv. § 6).

The cognate case of "non-competing groups" (Cairnes) is amenable to the same law. The labour-market (cp. Mill, bk. iii. ch. ii. last par.) forms a particularly important instance —so far as it is legitimate to abstract efforts and sacrifices incurred with a view to preparation for that market (see below, p. 762, col. 1, par. 3).

Throughout the whole class of transactions which have been considered (A) there is wanting that adjustment between remuneration and effort and sacrifice which is the essence of the classical doctrine that cost of production determines value. Up to this point those who have impugned or ignored that doctrine are correct.

(B) A transition from the *régime* of "non-competing groups," to "industrial competition" (Cairnes) is obtained by supposing removed the barriers which have prevented competition. There ensues with the mobility of industry the equation of "net advantages" (Marshall) in different occupations. It will be convenient to break up class B in two: (1) where abstraction is made of division of labour; (2) more concrete.

(B1) Suppose each worker free to apply his labour in *doses*, or increments, to any industry —the abstract supposition implicitly made by Jevons in his analysis of labour (*Theory*, ch. vi.). No one will work in any branch beyond the point at which the trouble attending the last increment of product is just compensated by its remuneration. In this case then it becomes true that value is measured by the final disutility of the producer; while it does not cease to be true that, as in former cases, value is measured by the final utility of the consumer. There is no opposition between these verities; one need not be subordinated to the other.

In this case the relation between the two factors of value, utility and disutility, is almost as symmetrical as in what Prof. Marshall calls "the simplest case of equilibrium between desire and effort when a person satisfies one of his wants by his own direct action, as for instance when he picks blackberries. . . . After he has eaten a good deal the desire for more diminishes, while the task of picking begins to cause weariness which at last counterbalances the desire for eating, and equilibrium is reached." (*Principles*, bk. v. ch. iii. § 1). In such a case the question whether it was the desire, or the weariness, which "determined," or "regulated" the equilibrium would be insignificant.

The "fundamental symmetry" (Marshall) between the forces of demand and supply is aptly represented by mechanical illustrations. "Just in the same way, when several balls are lying in a bowl, they mutually determine one another's positions; and again, when a heavy weight is suspended by several elastic strings of different strengths and lengths, the equilibrium positions of all the strings and the weight mutually determine one another" (Marshall, *Principles*, bk. vi. ch. i.). The principle that water seeks its own level has been employed by Dr. Irving Fisher in his masterly *Investigations in the Theory of Value and Prices* (from *Transactions of Connecticut Academy*, vol. ix., July 1892) to construct a more elaborate illustration of the great principle thus enounced by Cournot, "Le système économique est un ensemble dont toutes les parties se tiennent et réagissent les unes sur les autres."

What has been said of the relation of disutility to value applies equally, or even better, to the "sacrifice" of postponing consumption. As Prof. J. B. Clark well says (*Yale Review*, No. 3), "the final act of abstinence is like the last act of labour, the costliest of all" . . . "the cost entailed on society by its final acts of abstinence is a second possible measure of value." It may be observed that the abstraction proper to this section (B1) is not so violent in the case of capital as labour. The idea of a capitalist distributing his outlay among different enterprises, from each of which *ceteris paribus* he will expect a similar return—is one that is partially realised in the "share" market. Compare Cournot, *Principes de la Théorie des Richesses*, 1863, Art. 45.

(B2) The "fundamental symmetry" between

utility and disutility as factors of value, continues to subsist when we restore the concrete circumstance of division of labour. But superficial differences arise. The individual may be conceived as seeking to maximise his total utility, *per saltum* by a change of occupations, rather than by doses distributed at different points of the industrial system. The equation of "net advantages" in different occupations, rather than of final disutilities, is now the condition. But the analogy of physical equilibrium is still appropriate. "The normal value of everything rests, like the keystone of an arch, balanced between the contending pressures on its two opposing sides. The forces of demand press on the one side, those of supply on the other" (Marshall). We must regard "the various elements of an economic problem—not as determining one another in a chain of causation—A determining B, B determining C, and so on—but as all mutually determining one another" (*ibid.* preface to 1st ed., p. xiv.).

To rightly apprehend the relation between value and cost of production it should be considered that one occupation may comprise several commodities. The production of different articles has been joined together by nature or custom. It would be idle to expect the value of beef and hides to be respectively proportioned to the quantity of labour "worked up" (Ricardo) or "congealed" (Marx) in each. A person who chooses a literary or academic career may hope to be, on the whole, as well off in that as in any other line open to him; but he must not expect the pay of each particular task—*e.g.* writing an article, or giving a lecture—to be proportioned to the trouble (cp. Mill on *Subsidiary Industries*, bk. ii. ch. xiv., and see JOINT PRODUCTION).

The sense in which value, in the case under consideration (B2), is determined by cost of production, as well as marginal utility, appears to the present writer to have been best stated by Prof. Marshall. Besides showing the interdependence of the two factors, as above mentioned, he also makes it clear that *time*, "a long period," is required in order that the forces of supply should work themselves out. Thus in the case of labour the adjustment between cost and value must be dated from the time when parents begin to make efforts and sacrifices with a view to the education and advancement of their children. There is presented the vast conception of trained industry put upon a future labour-market, by parental providence, for vicarious remuneration.

But perhaps no form of words devised by one person can be expected to recommend itself to all others as the best adapted to express the subtle relations of utility and cost to value. As in higher spheres of speculation, it may be hoped that differences of doctrine are less important than at first sight would appear.

The authorities on the more general case of value in exchange defy quotation by their number. Those to whom the present writer is most indebted have been mentioned in the text.] F. Y. E.

EXCHANGE, VALUE IN. HISTORY OF GROWTH OF THEORY. For the purpose of an elementary survey of the history of the theory of value we may roughly divide the various theorists into two "schools"—the "cost-of-production" school and the "utility" school. The "cost" school is the older; its sway over our science has only begun to be broken in the last few decades by the "utility" school, the earliest quite consistent representatives of which wrote in the middle of this century.

The "cost-of-production" school.—The first step towards an analysis of the economic phenomenon of value consisted in a discrimination between value in use and value in exchange. Aristotle makes this important distinction: "To take *e.g.* a shoe, there is its use as a covering of the foot, and also its use as an article of exchange" (*Polit.*, i. 9, p. 22 of Welldon's Transl.). His example is followed, among English economic thinkers, by Locke ("Considerations of the lowering of interest and raising the value of money," in *Works*, ed. 1714, ii. p. 21) in the end of the 17th, and by Hutcheson (*System of Moral Philosophy*, 1755, ii. p. 53) in the middle of the 18th century. Locke, *l.c.*, speaks of "the intrinsic natural worth of anything," as separate from its "value"; and Hutcheson, *l.c.*, observes that "the prices and values in commerce do not at all follow the real use or importance of goods for the support . . . of life." French physiocrats (*e.g.* Dupont and Quesnay), speak of *valeur usuelle* and *valeur vénale;* and Turgot distinguishes between *valeur estimative* and *valeur commerçable* or *échangeable*, defining the first as a purely individual, the second as an essentially social mode of weighing the sacrifice, necessary in order to get possession of the commodity, against the enjoyment of possessing it. English economic treatises of the 18th century sometimes show an appreciation of the difference between use value and

exchange value by discriminating between the words "worth" and "value."

When Adam Smith wrote his *Wealth of Nations*, he made this old primary analysis of value the basis of further analysis. He first hints that "things" must have some "value in use" in order to have any "value in exchange," and then for a time entirely drops "value in use" out of the discussion, proceeding to investigate "what is the real measure of this exchangeable value; or, wherein consists the real price of all commodities," and "what are the different parts of which this real price is composed or made up" (bk. i. ch. iv. p. 42, ed. 1793). He does not explicitly treat the problem: How does value measure men's desires to possess, or consume, commodities? This significant feature is, however, to be found among the French physiocrats. Turgot—("Valeurs et Monnaies," in *Œuvres*, ed. Daire, vol. i. p. 83) says: "For an isolated individual, the *valeur estimative* of an object is precisely that portion of his total faculties (*la portion du total de ses facultés*), which corresponds to his desire for the object, or which he is willing to employ in order to satisfy this desire." Adam Smith proceeds (comp. bk. i. ch. iv. and ch. vii.) to discuss "the different circumstances which sometimes raise some or all of these different parts of price above, and sometimes sink them below their natural and ordinary rate," *i.e.* their cost of production—or "the whole value of the rent, labour, and profit, which must be paid in order to bring" the commodity to market. Here he looks at the problem chiefly from the point of view of the seller, as if exchange were regulated almost exclusively by estimates of labour or cost. In this connection he uses "worth" and "cost" as identical terms. The manner in which Adam Smith treated this question gave rise to that school of economic thinking which (to use the phrase of Professor Nicholson, art. "Value" in *Ency. Brit.*) regards utility "simply as a kind of entrance examination which every commodity must pass to enter the list of valuables, whilst the place in the list is determined by variations in the degree of the difficulty of attainment."

Ricardo states: "Utility then is not the measure of exchangeable value, although it is absolutely essential to it" (*Principles*, ed. Gonner, p. 5). Elsewhere (pp. 7, 8), Ricardo speaks of labour as the "foundation of the exchangeable value," and of "quantity of labour realised in commodities" as "regulating their exchangeable value."

Malthus (*Principles*, ed. 1820, p. 52) sees that value in exchange "does not depend merely upon the scarcity in which commodities exist . . . but upon the circumstance of their not being distributed . . . in such quantities to each as the wills and powers of individuals will enable them ultimately to effect by means of exchanges." He does not, however, search further into the relation between "such quantities" and their value in use. This latter term he describes in his *Definitions* (ed. 1827, p. 234) as being "synonymous with utility. It rarely occurs in political economy, and is never implied by the word value when used alone."

J. S. Mill emphasises more strongly than his predecessors the importance of the play of supply and demand in determining exchange value. He, however, retains Ricardo's notion of two laws of value: one for commodities that "are susceptible of being multiplied at pleasure," and another for commodities that are not. These latter, "no doubt, are exceptions," and it is for these latter that he conceives his supply-and-demand theory of value (*Principles*, bk. iii. ch. ii.).

Karl Marx, the founder of German social democracy, seeks, on the lines of Hegelian dialectics, to separate value in use totally from value in exchange. The latter is "something quite independent" of value in use; and an investigation of value in use may be of some good in commercial education, as "die Disciplin der Waarenkunde," but does not belong to economic science, though "nothing can have exchange value without being a thing of utility" (*Das Kapital*, ed. 1883, pp. 2 and 8). Exchange value, Marx continues, is a ratio, and as where there is a ratio there must be homogeneity, he arrives at the conclusion that commodities can only be homogeneous as products of human labour. This, therefore, determines value. Marx's theories, though they have never been accepted by any economist of note, are worth consideration, partly because of their enormous influence on socialistic workmen in different parts of the world; partly because they undoubtedly display some of the worst consequences of consistently neglecting to analyse consumption or demand as carefully as production or supply.

Turning to the French, German, and other Continental theorists of the cost-of-production school, we find that, with few exceptions, they have been far more disposed to devote attention to the utility element of value in exchange than the "classic" English school from Smith to Fawcett. Though there are most important scientific divergences between the majority of 19th century German economists and the new "Austrian school," it is still by no means difficult to look upon the former as slowly and laboriously paving the way for the latter.

J. B. Say indicated (*Traité*, ed. 1803, ii. p. 58) that the fundamental elements of value in exchange were, the quantities offered and demanded, and the expense of production, which latter he called "the natural value" of the commodity. He set the example for later French

economists of treating the value problem as essentially dealing with the laws which determine when and how "utilities" exchange against one another. "No doubt what determines us to give up a commodity which we possess in order to get another is some quality in this other commodity which pleases us, and which quality is not to be found, or to be found only in less amount (*à moindre dose*) in the commodity which we give in exchange" (Coquelin and Guillaumin, *Dict. de l'Éc. Pol.*, 1853, vol. ii. p. 808)—this, and not the cost of production, is the starting point of most French discussions of value. J. Garnier's definition (*Traité d'Éc. Pol.*, ed. 1889, p. 280): "things have value in exchange when they are useful and, at the same time, transferable and scarce; that is to say, value in exchange is exchangeable utility, corresponding to the amount of labour which the thing saves, and, in most cases, owing its existence to labour and other expenses," is characteristic of the standpoint of many French economists. An exception from the general French attitude is F. Bastiat, notable not so much for solid scientific merits as for a widespread popularity. He defines value in exchange as "the proportion (*rapport*) between two services exchanged" (*Harmonies Économiques*, ed. 1851, p. 118).

Among most German economists of this century there is a tendency to treat utility as of at least equal importance with cost of production in the determination of exchange value, "The value in exchange of a commodity, or its suitableness for the purpose of being exchanged against other commodities, depends upon that combination between use-value and cost-value which has its rise in the economic relations of men one with another," writes W. Roscher in his *System der Volkswirthschaft*, ed. 1882, i. p. 10. And Schäffle defines value in exchange as "a disguised comparison between the cost-values and the use-values of the two commodities which are to be exchanged against each other" (*Kapitalismus und Socialismus*, p. 35). In his *Bau und Leben des socialen Körpers*, ed. 1878, iii. p. 279, the same writer shows that exchange value is at the same time an individual and a social phenomenon. Adolph Wagner (*Allgem. od. theoret.. Volksw.*, Thl. I., *Grundlegung*, ed. 1876, p. 47) says that "the exchange value of a commodity depends, for the individual who demands it, upon its degree of concrete utility for him, and upon the difficulty of getting it." Wagner is careful to observe that value in use is "the foundation of all the estimates" which determine exchange value, and that difficulty of attainment is an incident which, though in most cases present, can by no means be used exclusively for the definition of exchange value. The position of the majority of living German economists is also well represented by Professor Neumann in Schönberg's *Handb. d. Pol. Oek.*, ed. 1885, vol. i. p. 156, etc. He proposes to abandon the phrases "value in use" and "value in exchange" as not sufficiently emphasising the all-important personal element in value. The essential thing in all the varying meanings of value (*Werth*) is "the estimate (*Beurtheilung*) of the usefulness or fitness of a thing for human interests, wants, or aims." Neumann, however, does not enter into any far-reaching examination of the relations between his subjective and objective "categories of value." This intermediate position between the extreme cost-of-production school and the modern utility school is, however, not taken by Max Wirth, Prince Smith, and several other German "free traders." Their value theory is very closely related to that of BASTIAT (*q.v.*) and to that of the classic English school. Another notable dissenter from the majority of German economists is Eugen Dühring. He has adopted the value theory of H. C. Carey, according to whom value "results exclusively from labour." Value in exchange is "the measure of the resistance offered by nature, to the possession of the things desired," or "the measure of the power of nature over man" (*Principles of Social Science*, ed. 1877, ch. vi. § 88). The economic writers among the German social democrats continue to follow Karl Marx.

[In the following works are to be found references to the more important writers of the cost-of-production school both in England and on the Continent. W. Roscher, *System der Volkswirthschaft*, ed. 1882, vol. i. p. 10-12, footnotes.—Adolph Wagner, *Grundlegung*, ed. 1876, pp. 37-40, 43, footnotes.—Schönberg, *Handbuch*, ed. 1885, vol. i. p. 156, footnote; also footnotes to several of the following fifteen pages.—Coquelin et Guillaumin, *Dictionnaire de l'Éc. Pol.*, 1853, article "Valeur."—J. Garnier, *Traité d'Éc. Pol.*, ed. 1889, pp. 275-280, 692-694.—J. R. M'Culloch, *Literature of Pol. Ec.*, ch. i.—J. K. Ingram, *History of Pol. Ec.*, 1888.—L. L. Price, *History of Engl. Pol. Ec.* since Adam Smith, 1890.—K. Marx, *Das Kapital*, vol. i., footnotes to ch. i.—E. von Böhm-Bawerk's *Kapital und Kapitalzins* (Engl. Transl. by W. Smart), contains in its historical part, vol. i., a great number of bibliographical references, which are very useful to a student of the history of the general theory of value, though the book deals only with the history of the theory of interest.—Specially for Italian theory: Augusto Graziani, *Storia critica della Teoria del Valore in Italia*, Milano, 1889.—Specially for early German theory: W. Roscher, *Geschichte der National-ökonomik in Deutschland*, 1874.]

The "Utility" School.—Though all economists insist that "utility is indispensable to value," and though many of the writers who have been classed as belonging to the cost-of-production school strongly emphasised the great importance of utility to value in exchange, they never succeeded in working out a consistent

quantitative theory of the general and necessary connection between utility and value in exchange. To have done this is the scientific characteristic of the "utility school." The principal achievements of this school, as far as they concern the general theory of value, consist (1) in the discovery of the connection between the variation of the utility to an individual of a unit of a commodity and the variation of the number of such units possessed or commanded by him; and (2) in the discovery of the law of the marginal determination of all forms of exchange value (see MARGIN). These discoveries led to the important distinction between total utility and degree of utility, and to the unravelling of the complicated connection between exchange value as determined in a market, under the influence of free competition between producers and consumers, and the marginal degree of utility of a unit of the commodity to individual dealers in the market. These deductions have led to the general theory that *value in exchange is a relative marginal degree of utility and a function of quantity possessed.* Hence it is concluded that variations in cost of production or difficulty of attainment can never directly affect or, strictly speaking, determine value in exchange, but only indirectly affect it, when and in so far as the variations in cost of production affect quantity possessed — such conditions as time and FRICTION (*q.v.*) being taken into account. What directly determines exchange value is not the desire to avoid work, the root idea of the "cost" school, but the desire to possess the commodity—not the production, the past history of the commodity, but the consumption, the future destiny of the commodity. This theory is the result of quantitative analyses of CONSUMPTION (*q.v.*). The "cost" school had in a very conspicuous manner neglected the theory of consumption—had indeed often denied that there could be such a thing. The "utility" school, on the contrary, looks upon the quantitative theory of consumption as the only sound basis of economic theory in general.

The root idea of the "utility" theory is to be found in economic treatises from the earliest time, *e.g.* Aristotle. "It follows," he wrote, "that such things as are the subjects of exchange must, in some sense, be comparable. . . . Money . . . measures everything, and consequently measures, among other things, excess or defect, *e.g.* the number of shoes which are equivalent to a house or a meal. . . . But this will be impossible unless the shoes and the house or meal are in some sense equalised. Hence arises the necessity of a single universal standard of measurement. . . . This standard is in truth the demand for mutual services, which holds society together; for if people had no wants, or their wants were dissimilar, there would be either no exchange, or it would not be the same as it is now" (*Nic. Ethics*, v. 8, p. 152 of Welldon's transl.). Condillac (*Le Commerce et le Gouvernement*, ed. Daire, 1847, p. 250) observes: "We say that a thing is useful when it serves one of our wants. . . . According to this utility we estimate the thing more or less. . . . Or, it is this estimate which we call value. . . . The value of things is then founded upon their utility, or, what amounts to the same, upon our wants for them, or, what still amounts to the same, upon the use we can make of them." B. Hildebrand (*Nationalökonomie d. Gegenwart u. Zukunft*, 1848, p. 318) foreshadows the theory that value is determined by marginal utility and is a function of quantity wanted. The French engineer Dupuit, when attempting to find a measure for the utility of public works, observed that the utility of a commodity is often not only different for different individuals, but that it will vary enormously for the same individual when the quantity possessed or commanded by him varies. "The utility for the same individual of a piece of bread can grow from zero to the amount of his whole fortune" ("De l'influence des péages sur l'utilité des voies de communication," in *Annales des ponts et chaussées*, 1849, p. 185; also "De la mesure de l'utilité des travaux publics," in *Annales*, 1844). Dupuit states (*Annales*, 1849, p. 172) that his theory is an elaboration of that of P. L. O. Rossi, who considered the theory of utility as the true basis of economics. Other more or less fragmentary attempts at building a value-theory upon an analysis of utility are to be found in writings of K. H. Rau, von Thünen, Friedländer, Knies, Schäffle, L. von Stein, A. Walras, Th. de Quincey, Samuel Bailey, R. Jennings, and others (see the bibliographical notes by Menger and Jevons referred to below).

The first economists who succeeded in establishing and elaborating a consistent theory of value by a thorough analysis of consumption or demand, were A. Cournot and H. H. Gossen. In his *Recherches sur les Principes mathématiques de la Théorie des Richesses* (Paris, 1838) Cournot observes (p. 22): "What is truly important is to know the laws which govern the variations of values, or, otherwise expressed, to have a theory of wealth. This theory alone will allow us to show to what absolute variations are due those relative variations" (in values) "which fall within the field of observation." In the chapter on "the law of demand" Cournot writes: "Let us then assume that the annual demand D for each commodity is a special function F (p) of the price p of this commodity. To know the forms of this function would be to know what we call the law of demand. . . . The form of the function would evidently depend upon the nature of the utility of the commodity, upon the nature of the services which it can render, or upon the

enjoyments which it can procure, upon the habits and the customs of each people, upon the average wealth and upon the scale according to which this wealth is divided" (p. 50). Cournot proceeds to argue (p. 56) that "as the function F (p) is continuous, the function pF (p), which expresses the total value of the quantity annually demanded, must also be continuous." Further, it is possible to assign to p such a small value that pF (p) becomes zero, and also to assign to p so high a value that the same happens. It is easily seen that these quantitative relations between price and quantity demanded at that price have their exact analogy in the subjective fact, not treated by Cournot, that the value in exchange of a commodity is the differential coefficient of its value in use.

The treatise by Gossen entitled *Entwickelung der Gesetze des menschlichen Verkehrs und der daraus fliessenden Regeln für menschliches Handeln* (1st ed., Braunschweig, 1854), opens with the explicit assumption of economics being the theory of pleasure and pain—economic activity having for its aim the realising of a maximum of pleasure with a minimum of pain. He proceeds in a strictly logical sequence to expound the theories of utility, of labour, and of exchange. "The magnitude of the same desire," writes Gossen, "diminishes steadily, when we without interruption continue to administer to it, till at last a state of satiety is reached" (p. 4). He distinguishes between total utility, degree of utility, and marginal degree of utility.

The two early pioneers of the utility theory of value, Cournot and Gossen, failed to gain recognition. Their suggestive writings were practically unknown at the time when W. S. Jevons, Karl Menger, and Léon Walras, early in the seventies, published independently of each other their epoch-making treatises.

Jevons as early as 1860 thought out the outline of his theory, and had in 1862 published a preliminary notice of the same. His well-known *Theory of Political Economy* (1st ed. 1871, 3rd ed. 1888) has exercised a great reforming influence. Its most salient and enduring feature is the profoundly philosophical spirit in which its early chapters deal with the method and very foundation of the science. In his introduction (ch. i.) Jevons contends "that economics, if it is to be a science at all, must be a mathematical science . . . simply because it deals with quantities" (pp. 3, 4, 2nd ed., 1879). Having shown the mathematical connection between total utility, or value in use, and degrees of utility, having framed the law of variation of final or marginal degree of utility, and having shown how this law rules the distribution of a commodity in different uses, he only needs to define MARKET (*q.v.*) and to formulate the LAW OF INDIFFERENCE (*q.v.*) to lay the foundation of his theory of exchange (ch. iv.). This is expressed in the words: "The ratio of exchange of any two commodities will be the reciprocal of the ratio of the final degrees of utility of the quantities of commodity available for consumption after the exchange is completed" (p. 103). Jevons continues: "There are two steps between labour and value. Labour affects supply, and supply affects the degree of utility, which governs value, or the ratio of exchange" (p. 179).

Léon Walras, in *Éléments d'Économie politique pure, ou Théorie de la Richesse sociale* (1874), and subsequent works supported the same theory of value as Jevons, the chief point of difference being one of terminology. Walras, for example, often using the highly concentrated and therefore rather ambiguous term rarity (*rareté*) instead of final or marginal degree of utility. Léon Walras developed the mathematical utility theory of value expounded by his father A. Walras, and he also utilised the work of A. Cournot above referred to.

Karl Menger published his *Grundsätze der Volkswirthschaftslehre* in the same year as Jevons his *Theory* (1871). In the preface he announces as his object to frame so general a theory of price that it accounts not only for price of commodities but also for interest, wages, rent, etc. (p. x.). He approaches his subject by way of an elaborate analysis of the economic significance of goods (*Güter* as distinct from *Waaren* or commodities), and he establishes in the very first chapter the doctrine of the different "orders" of goods—a very characteristic part of his theory, and valuable as an attempt to broach the special problems of the value of tools or of goods which only indirectly serve our life. Menger's theory of value (pp. 98-99 and 107-108) is in substance the same as that of Jevons and Walras though not formulated with the same amount of precision.

[During the last ten or fifteen years there has grown up in England, America, Austria, Germany, Holland, Italy, France, and Denmark, a "school" of economists engaged in developing the science on the lines of Jevons, Walras, or Menger. The well-known treatises of such Continental economists as E. von Böhm-Bawerk, Friedrich von Wieser, Wilhelm Launhardt, R. Auspitz, and R. Lieben, N. G. Pierson, Emil Sax, Harald Westergaard, are all founded upon the utility theory of value. The new theory has, besides, exercised a very marked influence on many prominent economists of the present day who, like Professor H. Sidgwick and Professor F. A. Walker, cannot be said actually to belong to this "utility school."

Among English treatises distinctly belonging to the "utility school," we can only mention a few. F. Y. Edgeworth's *Mathematical Psychics* (1881) is interesting as an attempt at utilising the new theory for establishing, on strictly mathematical lines, a science of social life. *The Alphabet of Economic Science*, by Ph. H. Wicksteed (1888), takes up the theory of value of Jevons, and gives a popular explanation of the fundamental

theorems of the higher mathematics upon which it rests. Professor A. Marshall, in his *Principles of Economics*, vol. i. (1890), shows the true organic connection between the modern theory and the doctrines of the leading economists of the past.

The most complete bibliography to the value theory of the utility school is found in the appendix to W. S. Jevons's *Theory of Political Economy*, ed. 1888. See also: Carl Menger, *Grundsätze der Volkswirthschaftslehre*, thl. i. 1872 (notes to pp. 78-80, 108-113, 215-216, are excellent as a guide to German writers on the subject); Léon Walras, *Théorie de la Monnaie*, 1886, pp. vii.-ix.—Auspitz and Lieben, *Untersuchungen über die Theorie des Preises*, 1889 (preface).—Graziani, *Storia critica della Teoria del Valore in Italia*.—R. Zuckerkandl, article "Preis" in Conrad's *Handw. b. d. Staatsw.*, also same writer's *Zur Theorie des Preises*, 1889.—E. Cannan, *History of the Theories of Production and Distribution in English Pol. Ec. 1776-1848*, 8vo, 1893.] G. F. S.

EXCHANGE (USURY). See USURY.

EXCHANGE, as BOURSE. (*a*) A place where merchants, bankers, brokers, etc., assemble at certain hours for the transaction of business; and (*b*) the assemblage itself. In both senses the word is commonly contracted into 'Change.

"The last yere, I shewyd your goode lordeshipe a platte, that was drawen howte for to make a goodely Bursse in Lombert strette for marchaunts to repayer unto. I doo suppose yt wyll coste ii. M. li (£2000) and more, wyche shalbe very beautyfull to the citti, and allsoo for the honor of our soverayngne lord the Kinge." Thus wrote Lord Mayor Sir Richard Gresham in 1538 to Cromwell, the lord privy seal. He had recently seen and admired the new *Burse* at Antwerp, and was anxious that London merchants, whose custom it was to congregate twice a day in the open air in Lombard Street, should be provided with a similar house, or covered walk, to shelter them from the inclemency of the weather. But powerfully as he advocated the scheme, it did not find favour. Owners of property were difficult to treat with; and, as the merchants themselves appear to have been completely indifferent, the plan was suffered to fall through. After the lapse of a quarter of a century, it was however again brought forward by his public-spirited son, Sir Thomas Gresham. On the death of his only child in 1564, Sir Thomas appears to have conceived the idea of making his country his principal heir; he munificently offered, provided the city would furnish a suitable site, to erect the building at his own expense. His fellow-citizens gratefully accepted the offer; they raised a sufficient sum by subscription, purchased the piece of land on which the Royal Exchange now stands, and conveyed it over to him. By the end of 1568, merchants were able to hold their meetings within the building. It consisted of a quadrangular arcade, enclosing an open court, and bore a general resemblance to the *Burse* at Antwerp, which had suggested the plan. After completion, it was inspected and formally opened (23rd January 1571) by Queen Elizabeth, who "caused the same Burse by an herralde and a trompet to be proclaimed the *Royal Exchange*, and so to be called from thenceforth, and not otherwise." Gresham had ordained in his will that, on the death of his wife, who was to enjoy the rents during her lifetime, the Royal Exchange should be vested in the hands of the Corporation of the City of London and of the Mercers' Company, conjointly, and to them it in due time reverted. Exactly 100 years after the laying of the foundation stone, the building was swept away in the great fire of 1666; and its successor, the second exchange, was also destroyed by fire in 1838. The present structure dates from 1844.

To the inquiring foreigner or stranger who nowadays visits the Royal Exchange, as many do, in the expectation of finding there the very heart and focus of the business of London, the silence and the deserted appearance of its interior are a constant source of wonderment; for with the exception of a short interval in the afternoon, when it is resorted to by dealers in some of the minor branches of commerce (paper, oil, drugs, etc.), and of an hour or so on Tuesdays and Thursdays, when foreign bills are dealt in, it appears to the observer to be entirely given over to loungers. As a matter of fact it has to a great extent outlived its object. In the time of Gresham, and for many years afterwards, the space afforded by the quadrangle and ambulatory was doubtless amply sufficient for all requirements, but to-day the building would hardly give standing-room to a tithe of those who every day come together in the city to discuss and transact affairs; long ago it became apparent, as the throng grew more and more dense, either that the exchange must be greatly enlarged, or that some of those who frequented it must forgather elsewhere. One after another, accordingly, the larger and wealthier sections of traders forsook the parent assembly and built homes for themselves in more convenient localities. The dealers in stocks and shares, the produce merchants, shipowners, insurance underwriters, coal, metal, corn, hop, wool-traders, and others, now possess their own separate exchanges. There is, however, one small but important group which still transacts business in the old parent centre, and which the mind more particularly associates with the word "'Change." On Tuesdays and Thursdays, immediately after luncheon time, the principals of the great merchant-banking houses, and of the foreign and Anglo-foreign joint-stock banks, collect at the eastern end of the courtyard to discuss matters of common interest and to deal in foreign bills. The attendance is never very large—not more perhaps, including the brokers,

than five or six score; but it comprises members of firms whose names are "household words" on every bourse throughout the world, and is eminently representative of the financial side of England's *Welthandel*. Hubbub and excitement, apparently necessary concomitants of the dealings in other commercial assemblies, are here entirely absent; the negotiations are conducted in a quiet undertone, and with an air of nonchalance which might almost lead the onlooker to believe that the chief object of the meeting is conversation, and that business is quite a secondary consideration.

Formerly the foreign mails were despatched from London only twice a week, on Tuesdays and Fridays, and on these "post days" alone were foreign bills negotiable on "'Change." Though times have changed, the custom of a bi-weekly meeting (since 1879 fixed for Tuesday and Thursday) still subsists, as it is found that two exchange-days are quite sufficient for all practical purposes, and are perhaps even more advantageous than a daily market would be, inasmuch as they collect on the same spot and at the same time all the important buyers, and therefore establish a genuine quotation.

Owing to the fact that the settlement of our mercantile transactions with other countries is effected almost entirely by means of bills drawn on London from abroad—the bills drawn on abroad from England forming only a very small fraction of the whole, that is to say, our exporters, instead of drawing against their sales, mostly arrange to have remittances sent them; and our importers, instead of remitting against their purchases, mostly arrange to accept,—the traffic in "London" paper on the Continental bourses is on a far larger scale than that of the dealings in foreign bills on the Royal Exchange; and the buying and selling of long or short "London," either for the portfolio—as stock-in-trade, investment, or speculation, as the case may be—or in execution of orders received from customers, is part of the regular round of a Continental banker's duties, and necessitates his daily attendance at the bourse. An English banker, on the contrary, is rarely or never seen on "'Change," as he confines his bill-operations to paper payable at home, and immediately disposes through his broker of whatever foreign paper may be sent up to him from the provinces for negotiation. A notable consequence of this predominance of foreign-drawn over English-drawn paper in the various markets is that the course of most of the exchanges is controlled from abroad, and that the fluctuations registered here are mere reflections of the movements produced by forces operating on the other side. G. C.

EXCHANGE, STOCK. The largest stock exchange in the world is that of London, in which securities to the nominal value of £7,004,789,088 are marketable, or were so on 31st Dec. 1891. These securities are officially recognised, and there are besides numbers which have no official quotation, but are yet dealt in from time to time according to the speculative rage of the moment. There are also in the United Kingdom eleven other exchanges, viz.:—those of Manchester, Liverpool, Leeds, Sheffield, Newcastle, Birmingham, Bristol, Aberdeen, Edinburgh, Glasgow, Dublin. The whole of these do not include the attendance of as many persons, or turnover of so much money and securities, as the London stock exchange alone. Their business, however, presents some points worthy of notice (see EXCHANGE, STOCK, PROVINCIAL). The London stock exchange is not only the chief of the English stock markets; it is also linked internationally with nearly all the financial centres of the world, and it would be difficult to name a security which could not find a market in London, either through the ordinary channels provided by *arbitrage* dealers (see ARBITRAGE), who buy in the cheaper and sell in the dearer markets, or through the agency of trusts which, by the aid of English investments, form funds applied to the purchase of a vast variety of securities in European, Asiatic, American, and Australian exchanges as well as those which are of native production. There has never been anything in history like the London stock exchange for magnitude and extent of financial resources. It is an immense business engine with certain unavoidable drawbacks which give it also the nature of an extensive gambling centre. On the whole, it has been found by experience that the advantages and merits of such an organisation outweigh altogether the drawbacks imposed by the too-speculative spirit of mankind. Members have been heard to assert that nine-tenths of the operations on which stockbrokers live by commission are gambling operations, and still it has been found by experience that, although the speculative public pay annually a heavy tax to the professional stock exchange element—it has been calculated that the annual revenue of members of the London stock exchange is £4,000,000,—yet the stock exchange provides a useful barometer; and sometimes, by its extreme sensitiveness to events which have yet to happen, eases and mitigates the effects of disasters which would otherwise have assumed proportions of a national calamity. The stock exchange is always running ahead of anticipated events, and the events, when they happen, being so "discounted," have the less effect if any effect at all. This is by no means the only public service done by the stock exchange. The modern fashion of turning over growing private undertakings into joint-stock companies makes the stock exchange a necessity. It is also a means by which astute men of business can

insure, or hedge, against the worst results of what would otherwise be a hazardous operation. It is on record that a large financial house, which had undertaken to supply the Spanish monarchy with a sum of money, went to Lloyds and insured the life of the king of Spain, in order to provide a hedge, as sporting men would say, against the possible death of the Spanish monarch, who happened to be in ill-health at the time. Similarly the stock exchange is often used as a hedge against commercial contracts. For example, if a group or firm of contractors have undertaken to supply steel rails for a South American railway at an advantageous rate, the chief contingency to be guarded against is default or discredit on the part of the state. While undertaking to contract on the one hand, they find it advisable to acquire the option to deliver stock at fixed prices on the stock exchange; so that, whatever happens, there is no great or irreparable loss to be feared. Commercial operations which depend on the maintenance of peace in Europe can obviously be entered into with some sort of security when it is possible to hedge against disaster by recourse to the stock exchange. It is a two-edged tool, however, and cannot be used safely by others than men of the greatest discretion and experience. We may usefully put on record here an extract from the conclusions of the royal commission on the London stock exchange, which reported in the year 1878 as follows:

"The public are enabled to count upon a reasonable speed and certainty in the transaction of business, and the vast amount of business done secures to those who deal in the London stock exchange as small a difference between the buying and selling prices as can be obtained in any other market. We think, however, that if it were possible, it would be desirable that the exchange should be open to the public,—not so much because an investor would in the event have any real control over the bargain which his broker might make for him, as for the purpose of removing a certain amount of jealousy and suspicion which is created in some minds by the present system." The stock exchange has not found it practicable to throw open its doors to the public, and it remains what it was—a strictly regulated club.

The report of the royal commissioners also contained these words: "In the main the existence of such an association, and the coercive action of the rules which it enforces upon the transaction of business and upon the conduct of its members, has been salutary to the interests of the public." The stock exchange having, or rather being, a valuable monopoly, it is not surprising that the tone of its government is exclusive. It has a share capital of £240,000, the shares being reckoned as £12 paid. The £12 shares are (in the year 1893) worth about £120 each, and none other than a member of the stock exchange is allowed to be a proprietor. For the year 1891-92, the dividend paid was £6 a share, or 50 per cent of the share capital, and the net revenue of the year had been £120,602 : 15 : 2, after payment of interest at 3½ per cent on £250,000 debentures. The share and debenture capital together are more than balanced by freehold and leasehold property, which stands at £596,111 : 8 : 3 in the accounts, and may be worth more. The value of the connection of the stock exchange may then be reckoned at something between two and three millions sterling.

The management of the stock exchange has thus been good enough to stand the test of public opinion during the fast-working 19th century. About the year 1700, dealers in public securities found the accommodation in the Bank of England too small and migrated to 'Change Alley; thence to Sweetings Alley in 1773, where a room was engaged and kept up by subscription; and afterwards to Capel Court where, in the year 1802, a building was opened, but the public were excluded. There were at that time about 500 subscribers, and this was the formal beginning of the stock exchange, as it is now known. Fifty years ago the number of members was about 350, and now (1893) the number is 3332, besides 1923 clerks, who are admitted at reduced rates. The stock exchange included, as it still includes, a responsible body, a complete organisation, a local habitation, a public institution privately managed. Its Benevolent Fund is unique.

Mr. F. Levien, for many years secretary to the committee for general purposes, in his evidence before the royal commission in 1877, described the internal administration of the stock exchange in the following words: "The administration of the stock exchange is vested in two bodies, whose functions are distinct. First come the managers, who represent the proprietors or shareholders in the undertaking, under the deeds of 1802 and 1876, who are the executive of the landlords of the house and premises, have control over all monies paid for admission, fix annually the charge for admission of members for the year ensuing, appoint all officials, except the secretary to the committee for general purposes and the official assignees, and superintend all matters connected with the building, supplies, etc." He goes on to describe the functions of the committee for general purposes, who are the executive of the subscribers, and "have control over the business of the house; make and administer the rules and regulations for the conduct of the business of the stock exchange; adjudicate all questions between members and complaints against members by non-members, if desired to do so by the latter. They investigate the question whether their published requirements have been com-

plied with by governments and companies asking for settlements or official quotations, for loans or shares, and have vested in their hands the election by ballot of those who seek to become members of the stock exchange." This committee have been known to suspend or expel members for offences against the body, also for those against the public, seeing that such conduct would be calculated to bring the stock exchange into disrepute. On the whole, the management has been successful, and, again on the whole, is approved by public opinion. New members are elected and old members re-elected on the first Monday in March of each year. An applicant for membership must be recommended by three members of at least four years' standing, each of whom must pay £500 in case of default by the new member within four years of his admission. The full entrance fee is £500 and the annual subscription £31 : 10. A. E.

(See BROKER, DEALER, JOBBER.)

EXCHANGE, STOCK, PROVINCIAL, IN GREAT BRITAIN AND IRELAND. The best known of the provincial stock exchanges are Birmingham with 25 members, Dublin with 67, Edinburgh with 54, Glasgow with 141, Leeds with 14, Liverpool with 163, Manchester with 75, and Sheffield with 26 ; collectively 565 members.

All are organised associations managed by committees, and the aggregate of yearly business transacted by them is very great. It is to be noted that cases of dispute and litigation between provincial brokers and clients are extremely rare, and it is claimed on behalf of these institutions that no description of business in this country is carried on with greater rapidity and accuracy than that in which these exchanges are engaged.

Up to the year 1890 the provincial exchanges had no common understanding or organisation ; but in that year was established what has since become widely known as the council of associated stock exchanges,—that is to say of provincial stock exchanges,—a consultative body composed of delegates, generally the chairmen and deputy chairmen of the various exchanges. The council meets annually, or more frequently in cases of emergency ; the presidency and administration being undertaken by the larger exchanges in turn. The provincial exchanges have long been engaged in the revision and codification of stock exchange rules ; a task likely to result in the institution of numerous common rules and identical practices. The first public action of this body was their successful attempt, by securing the guarantee of share titles, to avert from shareholders, in future, the disastrous possibilities opened out by the North-Western Railway Company's now historical denial of their stock certificates. The London stock exchange declined to take action in the matter, until the principle of indefeasible titles to securities had been accepted by public bodies and press opinion ; and the Forged Transfers' Acts, and the benefits resulting from them, will accordingly always be associated with the provincial exchanges, and more especially with that of Liverpool, upon a member of which institution devolved the labour and responsibility both of securing the passing of these acts and of putting them into operation.

The business of the provincial stock exchanges consists very largely of :—(1) Transactions for investment in British railway stocks —and with this distinction as regards the London stock exchange that, being practically brokers' markets, investors can there operate free from such profits as are absorbed by London dealers. (2) Speculative dealings in the above-mentioned securities. (3) Extensive dealings in shares of insurance, banking, shipping, and commercial undertakings. (4) Very extensive dealings in Canadian and American railway stocks. It is difficult to compute the extent of the yearly transactions upon the provincial stock exchanges named above ; they have been estimated in round figures at an average of £500,000,000. The number of public companies introduced in the provincial stock exchange centres, although at times considerable, bears but a small proportion to the total number annually brought before the public.

EXCHANGE, FOREIGN. The term foreign exchange denotes the value at which an amount quoted in the currency of the country where the transaction originates is interchangeable with that of a foreign country. The quotation of foreign exchange fixes the market value, for the time being, of foreign currency in the place wherein the quotation is made. For instance, if the French exchange is quoted in London to-day at 25 frs. 20 c. for cheques on Paris, it means that for every sovereign a London banker would buy or sell 25 frs. 20 c. in a cheque on Paris—one must say buy *or* sell, because it is most unlikely that he would do both, for there is always a difference between buying and selling, therefore the quotation is generally twofold—for instance 25 frs. 20 c. to 25 frs. 25 c., meaning that the London banker would give the public an order on Paris for 25 frs. 20 c. for each sovereign he receives, or would give a sovereign for every 25 frs. 25 c. offered to him in the shape of a cheque on Paris.

He thus leaves a margin of profit of, $2\frac{1}{2}$ centimes in each pound, either in buying or selling, the actual exchange being 25 frs. $22\frac{1}{2}$ c. This margin of profit pays for the trouble and outlay involved in the transaction, which the banker in London and his agent in Paris have to carry out.

It is necessary to point out that these quotations constantly fluctuate for various reasons, the principal cause being the balance of trade between different countries ; let us cite an instance :

If operators in France sell in England goods or securities of a greater value than what English operators sell in France, the balance of trade is said to be against England; consequently the quotation in Paris for pounds sterling declines. There are, however, indirect influences on the exchanges between different countries; for example, England may owe money to the United States for wheat, cotton, or other commodities, while the United States may owe money to France for silk or wine. In that case the American merchant would probably send to France bills drawn on England against the goods which English merchants have bought from him. These bills being sold in Paris would tend to depress the quotation of pounds sterling in Paris, just as if England owed the money to France. We thus see that foreign exchanges play an important part in facilitating the settlement of debts due by one country to another, thus avoiding the cumbrous mode of paying international indebtedness by the transmission of specie.

Another cause of variation in foreign exchanges is the inequality of the value of money in different commercial centres; money, like water, finds its level, it flows, unless some obstacle intervenes, to those countries where a better rate exists, until it equalises those differences. Those obstacles are the question of credit, and of the dissimilarity in the respective currencies; where these things are equal, a difference in discount rates will attract or repel money from one country to another. For instance, when the Baring crisis occurred in November 1890, the Bank of England raised its rate of discount to 7 per cent., which rate was maintained for some time, and was higher than the value of money in other commercial centres. The effect was immediately apparent; all foreign merchants and bankers who had confidence in their London agents remitted money to obtain a higher rate of discount than what obtained in their respective countries. These remittances acted on the foreign exchanges, causing them to advance to the gold export point (see GOLD POINT OF EXCHANGE), necessitating the shipment of gold to London.

Another effect of high discount rates is the depression in the value of merchandise and securities, such as bonds and shares held on borrowed money. These are sent to markets abroad where money is cheaper, and naturally money is sent to London in payment of the goods and securities received. Another cause of fluctuations in foreign exchange is internal disturbance, either social or financial, creating alarm and inducing the transference of money from one country to another for safe custody.

We have seen at intervals in Paris that disturbances have caused the exchange on London to advance very rapidly in consequence of large sums being sent to London for safe keeping.

The season when English people migrate to the Continent is generally marked by a decline in the value of sovereigns abroad, and the exchange is then said to move against this country. The quotation of exchange between countries using gold as the chief circulating medium can however only fluctuate between well-defined limits called the export or import gold points. Thus the exchange on London cannot for any length of time fall below 25 frs. 10 c., nor rise above 25 frs. 40 c.; because in the former case gold would be sent from London to Paris to purchase pounds sterling, and in the latter case the reverse operation would take place, and gold would be sent from Paris to London. The difference of 30 c. or 3d. per sovereign covers the freight and insurance, also the mint charges involved in converting the gold of one country into that of the other.

There is, however, considerable difficulty at times in fixing the exchange between this country and another which has a silver or paper currency. Sometimes the variations are great and rapid; sometimes it is difficult to fix a close ratio between buyers and sellers of exchange on countries having a basis of circulation different from our own. Let us take the exchange between this country and India, which is the largest silver using country in the world. The exchange in London on India varies materially and suddenly. On some occasions there has been no reasonable quotation for bills on our great dependency, because of the uncertain value of silver. The rupee declined from the rate of 2s. ¾d. in 1864, to the rate of 1s. 2⅝d. in August 1892, and subsequently even lower. These enormous fluctuations arose from the variations in the gold price of silver in this country, but the fluctuations in the exchanges between India and other silver-using countries has been very slight.

Thus the exchange between Shanghai and Calcutta has not varied as much during the past year (1891) as the quotation between London and Paris; in fact, the fluctuations between China and India seldom exceed ½ per cent, which represents the cost of freight and insurance on transmitting silver between those countries.

The greatest variations, however, arise in the exchanges between this country and those where there has been a suspension of specie payments. The most notable instances are with Russia, Spain, and Portugal in Europe; and with Brazil, Chili, and Argentine in America. There is hardly a limit to the possible depreciation of a paper currency. We have noticed, with regard to Argentine, a premium on gold of 300 per cent, or a reduction in the value of paper to one-fourth of its former gold value.

All depends in these cases upon the quantity of paper money issued, relatively to demand and to the absorbing power of the country con-

cerned and upon the credit of the government which is responsible for the ultimate redemption of the paper currency. We know that almost every country has passed through this critical financial stage; even in this country, at the beginning of the 19th century, gold has been quoted at a premium of over 50 per cent, as against Bank of England notes. At such a time the foreign exchanges were greatly adverse to this country, and all gold was exported. Thirty years ago the United States had a similar experience of a forced paper currency with foreign exchanges all against that country, causing the exportation of gold and silver to pay for war stores. We thus see that foreign exchange acts like a barometer giving indications of the financial aspect in every country, acting as a warning when a financial storm is impending, counselling those who have too many engagements afloat to take in sail; while in fair weather it gives an assurance of smooth water ahead, administering a well-founded impetus to all who embark in legitimate enterprises.

[See Goschen, *Foreign Exchanges.*] S. M.

EXCHANGE, FOREIGN, practical working of. If it be sought to apply the theory of the foreign exchanges to practical ends, or to draw trustworthy conclusions from their fluctuations, the following axioms should be noted.

Firstly, the current rate of exchange is the price of a bill of exchange. It is not necessarily the ratio at which the money of one country exchanges for the money of another. At a time when *e.g.* a cheque on Berlin is to be bought at 20·40 marks to the £, it may be necessary to pay 20·20 for German gold coin (because it must be assumed that the seller has been at the expense of importing it); but 20·40 would be called the rate of exchange, not 20·20.

Secondly, the price of bills is governed by the ordinary laws of supply and demand. When they grow scarce they grow dear, when they become plentiful they become cheap. If they become very dear, the would-be purchasers look round to see whether there is anything else they can remit to better advantage—produce, let us say, or some particular stock exchange security, or one of the precious metals—and, as soon as they discover such an article, they cease buying bills, and the price stops rising; if they become very cheap, the would-be sellers consider whether it might not pay better to employ the money standing at their credit abroad in the purchase of something—gold, say, or a foreign bond—which is saleable at home, and immediately this becomes feasible they cease offering bills, and the price stops falling.

Thirdly, the rate of exchange at A for cheques on B must correspond, or tend to correspond, with the rate of exchange at B for cheques on A. Thus if cheques on B stand at 1 per cent discount at A, cheques on A must be at 1 per cent premium at B; or in other words, if 99 units of A currency are equal in value for the time being to 100 units of B currency, then 101 units of B currency will approximately equal 100 units of A currency. For, suppose cheques on A stand at par in B, then if a banker at A pays 99 for 100 units on B, and sends it to his agent there with orders to buy and remit 100 units on A, it is evident that he will gain 1 unit on his outlay. It is also evident that such purchases would not only tend to reduce the margin, but would continue until it disappeared. Or again, notice what the London manager of the Anglo-Gallic Bank, to imagine a name, does, if, just as the exchange on this side relapses from 25·25 frs. per £ to 25·24, his Paris colleague telephones that as bills over there are rather scarce this morning the rate has improved a point to 25·26. "Then draw, say, £5000," he instantly replies; and forthwith proceeds to do the like himself. The result is as follows—

London pays £5000 (amount of the Paris draft), and receives £5000 (proceeds of its draft on Paris for fr.126,200 at 25·24).

Paris pays fr.126,200 (amount of the London draft), but receives fr.126,300, proceeds of its draft on London for £5000 at 25·26; showing without any outlay whatsoever, a gain of 100 francs. This is called arbitrage-business, and illustrates the manner in which the exchanges are actually regulated, for it is of course obvious that under the influence of such transactions the rates in Paris and London will very speedily be brought to a level.

Fourthly, as it is the custom of trade to give credit to the buyer who buys to sell again, most bills are drawn at a usance, varying from thirty days to six months, according to custom, and the usual exchange quotation applies to bills at usance. Between the exchange for a bill at sight and that for a bill at usance, the difference depends on the rate of interest prevailing in the place upon which it is drawn. The usance, for example, of bills on Italy is three months, and if interest in Italy rules at 4 per cent, a bill at usance should cost 1 per cent less than a bill at sight.

Fifthly, as the bills drawn on London from abroad vastly outnumber the bills drawn on abroad from London, the demand and supply of the former exercises a proportionately greater influence over the course of the exchange than that of the latter. In other words, the actual rise or fall takes place on the foreign market, and London in most instances merely adjusts its rates according to the quotations telegraphed from abroad.

Lastly, in those countries where the value of the currency oscillates in relation to gold, the exchange is subject to two sets of fluctuations—to fluctuations of limited extent caused by changes in the ratio of supply to demand, and

to fluctuations of almost unlimited extent caused by changes in the value of the currency-medium. Thus, if the normal exchange with a paper currency country be 48d. per $ gold, or $5 to £1, a rise in the gold premium, which is illimitable, from 200 per cent to 300 per cent would cause the exchange to move from 16d. per $ paper, or $15 per £, to 12d. per $ paper, or $20 per £. G. C.

EXCHANGE BETWEEN HOLLAND AND DUTCH INDIA. (The guilder converted in this statement as 12=£1.) To explain the working of the exchange between Holland and Dutch India, it is necessary to describe the different currency systems in force in the mother country and the dependency. To begin with that of Holland. At the commencement of this century the state of the currency in the Netherlands was very unsatisfactory. From early times silver had been the only standard of value, but an almost unexampled variety of silver coin was in circulation, owing to the fact that, during the existence of the Republic of the United Netherlands, nearly every province had a separate mint. Gold coin had also been struck, and was a medium of exchange at rates officially fixed by the government; but silver alone was legal tender until the year 1816, when (Act of 28th September) dual legal tender was introduced at the ratio of 15·87, between the then current silver guilder of 200 aas weighing 9·61 grammes fine, and the ten guilder piece weighing 6·056 grammes fine gold.

Gold being thus over-valued, as compared with the bimetallic ratio of 15½ adopted by France in 1803, all the full weight silver coins were driven out of the country, and gold coin, struck according to the law of 1816, together with all the worn and clipped silver coin of earlier date, formed the only circulating medium.

To remedy this state of affairs it was enacted in 1839 (Act of 22nd March) that the historical guilder of the weight of 9·61 grammes fine silver should be reduced to the weight of 9·45 gram fine, thus raising the ratio from 15·87 to 15·60; but the clipping of the old coin continued on a most scandalous scale, so that often a premium of 5 to 7½ per cent had to be paid for full weight pieces. A thoroughly efficient reform of the currency became indispensable, and a general recoinage of all the old silver money, struck before 1839, was accordingly ordered by the Act of 22nd May 1845.

Within a couple of years a nominal amount of 85 millions of guilders old silver (£7,083,000) was withdrawn from circulation and converted into new coin, at a cost of some 8 millions (£666,600), the operation itself being to a great extent facilitated by the still existing double standard, gold coin being available for the use of the public in adequate quantities. At the same time, the question whether the double standard system could be continued, became a matter of ample discussion in the press, and after lengthened debates in parliament the law of 26th September 1847 was enacted, by which the monetary system of the Netherlands was based on the silver standard only, with the silver guilder of 10 grammes and $\frac{945}{1000}$ fine as the unit, all the gold coins in the hands of the public being withdrawn from circulation and demonetised.

This decision was taken at a moment when nothing yet had transpired about the Californian and Australian gold-fields. That only became known to the world a couple of years later; nothing, therefore, can be more erroneous than the assertion, often made, that the final adoption of the silver standard as basis of the monetary system of the Netherlands originated in the fear of a probable fall in the value of gold. The greater convenience of silver for domestic purposes was the principal motive for a reform which at that time perfectly answered the purpose.

The recoinage of the old silver coins being completed in 1849, a beginning was made in the following year by withdrawing the gold ten and five guilder pieces from circulation. Of these g.172 millions (£14,333,300) had been coined and delivered to the public, but scarcely one-third of that amount, say g.50 millions (£4,166,600) was presented for exchange against the state notes (*muntbiljetten*). These notes were intended to be issued as a temporary medium of exchange only, but as the public became accustomed to them they proved so convenient that they still form a part of the currency of the country to a limited extent, 10 millions originally, and 15 millions at the present moment (£833,300, and £1,250,000).

All the gold coins received from the public were sold on government account at a loss of 1 million of guilders (£83,300), and altogether the reform of the currency, including the recoinage of the old silver money, and the demonetisation of the former gold coin, has been effected at a cost of about 10 millions (£833,300).

Since that date, 1847, the state of the currency became most satisfactory in every respect, and certainly no new reform would have been thought of if the monetary policy of the neighbouring countries had remained unaltered. But in 1872 the rulers of Germany deemed it advisable to introduce gold as the standard of the newly-constituted Empire, and it soon became evident that Holland could not remain indifferent to the intended reform of the German currency.

In October 1872, therefore, the Dutch government appointed a special commission to consider the subject and to advise as to the measures necessary in the interests of the country, and in December the commission re-

ported that it would be impossible for Holland to retain the silver standard established by the Act of November 1847, were all her neighbours to adopt gold as their standard of value. According to their views the most desirable solution of the question for Europe in general would be the adoption by the leading monetary powers of the double standard—admitting the free coinage of both gold and silver as legal tender at the same fixed ratio of value. They considered that a great stability of value for both metals would be the result of the compensatory action of that system, if introduced throughout the whole of Europe; that Holland alone would be powerless in the matter, and therefore that it would be indispensable for Holland to adopt the single gold standard should Germany decide upon that line of action, and that, in the meantime, without abrogating the law of 1847, the further coinage of silver on private account should at once be restricted or stopped altogether.

In conformity with the recommendation of the commission, the closing of the Utrecht mint for private coinage of silver was ordered by the law of 21st May 1873, and on Germany establishing the gold standard by the law of 9th July 1873, a bill was submitted to the states general, proposing the introduction of a legal tender currency of ten and five guilder pieces in gold, and the withdrawal from circulation of the silver standard coins issued under the currency regulations of 1847. The bill, however, was rejected; matters remained as they were until the middle of the year 1875, when, according to the law of 6th June, the mint was opened to the public for the coinage of ten guilder pieces of 6·048 grammes fine gold, to be legal tender concurrently with the silver guilder, the further coinage of which remained prohibited.

Thus the system of the *étalon boiteux* was introduced in the Netherlands, and, though it is of course open to the greatest objections, it must be acknowledged that, up to this moment, it has caused no serious inconvenience or mischief whatever. As a rule, the balance of trade is in favour of Holland, and bullion accordingly flows in freely. But occasionally the tide turns, as was the case in 1882, when a strong demand for export set in and the bank's stock of gold, which about the middle of 1880 had amounted to 80,000,000 of guilders (£6,666,600), decreased to below 5,000,000 (£416,600). The defect of the system then became evident. If once the gold stock of the country were exhausted, silver would become the regulator of the currency without any other limit to the depreciation of the currency and a corresponding rise in the foreign exchanges than the price of bar silver in the London market.

To protect the general interests of the country against the serious dangers eventually certain to result from such an unsettled state of affairs, a bill was passed (Act of 27th April 1884) empowering the government, as soon as the state of the currency should render it necessary, to withdraw from circulation, and to sell in the open market, silver coin to the amount of 25,000,000 of guilders (£2,083,300, at 12 gs. = £1) and to buy gold with the proceeds. Up to this moment, however (February 1893), there has never been any need to put this measure—which in the full sense of the term may be considered as the safety valve of the present currency system of Holland—into force. The law of 1884 is the unequivocal acknowledgment of the principle that the state is responsible for the maintenance of the gold value of the silver currency, and that it is one of the first duties of every government that has imposed a standard of value upon its subjects to take every reasonable precaution in its power to prevent that standard from fluctuating.

The currency system which has now been in force in Holland for about eighteen years, though defective in principle, has fully answered the requirements of the country, and it may remain unaltered for many years more unless it breaks down through the immense profit to be made by unscrupulous persons in manufacturing illicit coins of exactly the same weight and standard as the legal ones. But if this becomes the case, it will not only be Holland but nearly the whole continent that will have to face a difficulty of the greatest magnitude, the solution of which will make an international understanding with respect to money matters more urgent than ever.

Having thus described the system of currency in force in Holland, we will now turn to that of her Indian possessions.

In Dutch India the state of the currency was for many years even worse than it was in the mother country before the reform of 1847 was effected, and even the government itself was instrumental in wilfully perverting the currency of the colony.

The erroneous idea prevailed that the wants of the native population were on too limited a scale to require the precious metals for a general medium of exchange, and that it was in the interest of "the good people of these countries to increase the circulation of copper coin as much as possible" (*Decree of the Governor-General of Dutch India*, of 25th June 1818). Hence the government continued for years to effect the bulk of its payments in copper money, the so-called doits (*duiten*), which were imported in large quantities from Holland with the unavoidable result that all the good money formerly issued was driven out of the country. Silver was still the legal standard, and the silver guilder the unit of account, but virtually only copper remained as the general circulating medium for the whole community. A general depreciation of the currency was the natural consequence of this

state of affairs, a loss of 25 to 30 per cent having to be incurred on every remittance to Holland or elsewhere.

The colony suffered severely for many years under this miserable and scandalous condition of the currency. At last the government became aware that measures of a most stringent character ought to be taken to resettle currency matters on a satisfactory basis. By the law of 1st May 1854 the monetary system of the mother country, as regulated by the law of 1847, was introduced in Dutch India, and since that time nothing has been left undone by the authorities to secure the colony the benefit of a thoroughly efficient currency. For some consecutive years large shipments of silver coin from Holland to Java were made on government account, between 1854 and 1860, 90 millions of guilders (£7,500,000). Everywhere an opportunity was offered to exchange silver for the circulating copper money, and thus a long-wished-for reform was effected at a cost to the state of about 20 millions of guilders (£1,666,600).

Ever since that date the condition of the currency in Dutch India has been as satisfactory, nay as perfect, as in the mother country itself; even the recent silver crisis leaving it altogether unaffected in consequence of the measures taken by the government to keep the currency at the standard value by closing the Utrecht mint, not only for the home, but also for the colonial coinage. Having no mint of its own, Dutch India has always been supplied with the money required for circulation by specie imports from Holland, the standard coin being exactly identical, and the stock of silver legal tender money available in Holland has till now been more than sufficient to meet the requirements of the circulation of the colony.

Thus a very close link exists between the currency of Dutch India and that of Holland. At first it was thought that silver might remain the standard in the eastern possessions of the kingdom, whatever reform might be introduced in the monetary system of the mother country; but gradually the conviction prevailed that, equally with the people of Holland, the Indian subjects were entitled to protection from the difficulties in which the action of a depreciating currency must necessarily involve them, and to remove all uncertainty as to the standard of value in the colony the law of 28th March 1877 decided that gold ten guilder pieces should from that date be legal tender in Dutch India,—thus establishing the monetary system of the colony on exactly the same basis as in Holland.

Meanwhile no gold whatever is to be found in circulation in Dutch India; but the lack of gold has never caused any inconvenience, and is in fact of no consequence so long as the circulating silver money fetches the full value of gold for payments in Holland. Recently Dutch India has repeatedly had to face an unfavourable balance of trade, making the export of specie unavoidable (Table A), but the rate of exchange never exceeded the bullion point of gold (see GOLD POINT of exchange), since silver could always be used as a remittance to Holland in order to effect payments there, or to purchase sterling bills in Amsterdam for payments in England.

1891	101	99⅛	100⅛	12·05	11·925	11·975

In consequence rates of exchange at Batavia —the financial centre of Dutch India—have maintained a most remarkable steadiness during the last twenty years, as shown in table B, see page 775, to explain which it may be added that the way of quoting the rate of bills drawn on Amsterdam is exactly the reverse of the quotations for sterling paper. For the latter the Dutch Indian currency is the fluctuating term, the quotation consisting of a varying number of guilders and cents to be paid for the pound sterling. In the exchange between Batavia and Amsterdam, on the other hand, the latter place gives the "uncertain" a quotation of 101, meaning that g. 100 Dutch Indian currency gives claim to g. 101 Netherlands currency. Thus it is obvious that a rise in the quotation of bills on Amsterdam must correspond to a decline in sterling quotations. [See EXCHANGE, FOREIGN, practical working of.]

During the last twenty years in drawing from Java the extreme rates for Dutch bills have been 99¼ and 104½, and for English bills g. 12·125 and g. 11·375, thus showing a fluctuation of only 5¼ per cent for the former, and 6 per cent for the latter bills. Since 1875, when the great fall in the price of bar silver set in, rates have not fluctuated more than 2½ or 3 per cent. Thus Dutch India has been spared the disturbance in money and exchange matters which is causing so much inconvenience and loss in British India.

[A good insight into the present working of the currency of Dutch India may be obtained from a note by Mr. A. Kensington, deputy secretary to the government of British India in the financial department, dated 21st September 1892, and published by order of the governor-general of India. The conclusion of Mr. Kensington's inquiry during his stay in Java, was that the nominal gold standard introduced into the colony works well as regards the trade and the people of the country, and that it has on the whole also proved beneficial to the planters. But the fact is not to be overlooked that the whole structure must collapse in case Holland is forced by circumstances to complete its monetary reform by the demonetisation of the silver actually circulating as full legal tender money. Then the colony would be obliged to follow, and it is therefore not at all impossible that at some future period even the Eastern Archipelago may appear in the market for the sale of silver, and the purchase of gold, unless it may still be practicable to arrive at an international understanding about the free coinage of silver as proposed originally in the report of the Dutch currency commission of 1872.] N. P. v. d. B.

[Ratio of silver to gold in Holland, taking mint charges into account, 15·625 to 1.]

EXCHANGE BETWEEN GREAT BRITAIN AND BRITISH INDIA.—As these pages are passing through the press (June 1893), it has been made public that the government of British India has made an arrangement for its remittances between India and London, similar in many respects to that in existence between Holland and the Dutch Indies (see EXCHANGE BETWEEN HOLLAND AND DUTCH INDIA). The rate at which council bills are to be issued in London is to be separated from the price of silver. In order to effect this, the coinage of rupees in India on private account is to be suspended, with a view to the introduction of a gold standard. The Indian government had been anxious that this step should be taken; but the home government desired that a thorough examination into the whole matter should be previously made. A departmental committee was accordingly appointed, consisting of Lord Herschell, the present lord chancellor, as chairman, the other members being Mr. Leonard Courtney, Sir Thomas, now Lord, Farrer, Sir Reginald Welby of the treasury, Mr. Arthur Godley of the India office, Sir Richard Strachey, and Mr. B. W. Currie, who is a member of the council of India and of the firm of Glyn and Co. The committee considered the proposals of the Indian government, which aimed at fixing the exchange at the rate of 1s. 6d. per rupee. This rate the committee did not feel inclined to adopt; the market rate being at the time (June 1893) approximating to 1s. 2d. for the rupee. The general conclusions of the committee, in their report to the secretary of state for India, Lord Kimberley, were that "while conscious of the gravity of the suggestion, we cannot, in view of the serious evils with which the government of India may at any time be confronted if matters are left as they are, advise your lordship to over-rule the proposal for the closing of the mints and the adoption of a gold standard, which that government, with their responsibility and deep interest in the success of the measures suggested, have submitted to you. But we consider that the following modification of these proposals are advisable:—The closing of the mints against the free coinage of silver should be accompanied by an announcement that though closed to the public, they will be used by the government for the coinage of rupees in exchange for gold, at a ratio to be then fixed, say 1s. 4d. per rupee; and that in the government treasuries gold will be received in satisfaction of public dues at the same ratio." The Indian government acted immediately on this recommendation, and an act was passed in the council at Calcutta (June 1893) carrying the report of the committee into effect, and fixing the rate at 1s. 4d.

We are still too close to the events to judge what the ultimate results of this measure may be. The action of the government was immediately followed by a rise in the selling rate of India council bills in London from about 1s. 2d. to 1s. 4d. for the rupee, and by a rather more than corresponding fall in the market price of silver. Suggestions have been made

to bring the rate for council bills upwards to 1s. 6d., and ultimately to about 2s. for the rupee. It remains to be seen whether the Indian government will have sufficient control over the market for bills to enable it to carry this into effect. Nor can the influence on the coinage legislation of other countries—as for example on the United States of America—or on the rate of exchange in the trade with other silver-using countries be stated at present, or the effect which may be produced on the trade of British India, or on the condition of the people. One result, if the measure continues to operate, will be the formation of the largest "token" circulation of coins that has been known in modern times, as the rupee will circulate at the rate which the government fixes it at relatively to gold, irrespective of the gold price of uncoined silver; while for the present, at all events, there will be no gold coin to represent the rupee. A further result will be the entire separation of the rate for the bills on India from the market value of the ordinary circulation of the country. The council bills would, it was hoped, be issued at the rate fixed for the time by the Indian government. The arrangements, in so far as they are based on an authoritative rate fixed by a government for monetary transactions, and a fixed ratio between gold and silver are similar in some points to those on which bi-metallic systems have been founded; but while this is the case, the leading principle of bi-metallism, namely, the power of the subject to have his bar silver or bar gold coined into money and to be able to pay his debts with either metal so coined, is entirely absent. The success of the plan depends solely on the power which the Indian Council may be able to exert over the London market and if other and cheaper methods of remittance can be obtained this will fail. Meanwhile from the point of view of the Indian government the rate for exchange should be fixed as high as possible, as in the example of Dutch India, because of the advantage hence resulting in the remittances to England.

No reference has been made in this statement to the other points, many of great weight, connected with this question, such as the possibility of the private coinage—in the vast region of India, much of which is not under the control of our government—of spurious silver rupees equally valuable with those issued by authority, an operation which would be very profitable to the coiner—of the effect on the Indian cultivator of the soil, who will now be deprived of the resource which silver, in the form of ornaments, has been to him in time of famine—or of the result on the trade on other silver-using countries.

The measure, as it stands, was stated to be designed to prevent the rate from dropping lower, but it will have the effect of stereotyping the loss entailed by the fall in exchange both on the government and on private individuals at the point at present fixed.

[See *Report of the Committee appointed to inquire into the Indian Currency*, 1893.—*Correspondence between the Government of India and the Secretary of State*, 1893. Comp. *Econ. Journal*, Sept. 1893.]

[Ratio of silver to gold in India, with rupee at 1s. 4d., taking mint charge into acct., 22·37 to 1.]

EXCHANGE, INTERNAL. One factor in the calculation of all exchanges is the cost of the transmission of bullion, including therein the cost of actual transport and the risk and trouble involved. In the foreign exchanges these charges are in a general way concealed by the fact that the two sides are in terms of different currencies; and they are modified by the competition of bills of exchange, according to the supply and demand of which will be the proportion of such charges which a remitter will have to bear. The same expenses attach to the settlement of transactions between different parts of the same country, but they are rendered more apparent by being expressed in the form of a commission or premium. They are also usually more uniform, as they are not affected by momentary competition, but are governed by the condition of the banking system, tending gradually to diminish in proportion to the completeness of its development.

In this country the facilities for internal exchange are considerable, and its cost has been brought to a low point. The post-office system of money orders, and of postal notes and orders, furnishes the means of remitting small sums to almost every village, at a cost that has continually decreased as the facilities offered have increased. In the first quarter of the present century remittances could only be made to a few towns, and at a cost of about $2\frac{1}{2}$ per cent. At the present time the number of points to, or from, which remittances may be made has risen to upwards of 10,000, whilst the cost may not much exceed one-half per cent. For larger sums remittances were formerly made by bankers' drafts, or bank post bills, the charges on which were defrayed partly by a direct commission, and partly by deferred payment. At the present time, by means of the country cheque clearing (see CLEARING SYSTEM), remittance may be made throughout the whole of England and Wales absolutely without cost, whilst for the collection of drafts other than cheques, and for all collections in Scotland and Ireland, the cost has been brought generally to about $\frac{1}{20}$ of 1 per cent. This result is greatly due to the spread of branch banking (see BANKS, UNITED KINGDOM).

In the United States the development of the national banking system (see BANKS, NATIONAL, U.S.A.) has led to remarkable results in the same direction. This system was established in 1865, at which time the cost of southern and western exchange on New York was from 1 to

1½ per cent, and even for different parts of the state of New York it was ½ per cent. The difficulty of obtaining reliable remittances was even more serious than its cost, as the notes or drafts of banks in any state were frequently quite useless but a few miles beyond its borders. In 1890 the rates of commission or premium, on internal exchange, had so far declined that they ranged from 1 cent per $100 ($\frac{1}{100}$ of 1 per cent) in some small states, as Rhode Island and New Hampshire, up to 21 cents per $100 ($\frac{1}{5}$ of 1 per cent), in Nevada, Texas, and some other states.

In France the Bank of France, through its numerous branches, has long afforded considerable facilities for internal exchange, which have been added to in recent years by the still more numerous branches of one or two other banking institutions. R. W. B.

EXCHANGE OF NOTES (in reference to the note circulation in Scotland). All the banks now (1893) carrying on business in Scotland are banks of issue. They are ten in number, and there is a stringent system maintained of exchange of notes once a day in every town in which there are two or more banks. In the case of a bank holding the notes of another bank not represented in its town, these are remitted to the issuing banks at short intervals. On Saturdays there is an afternoon as well as a morning exchange, so that the returns of circulation made at the close of business on Saturdays, as required by the terms of the Bank Act of 1845, exhibit the amount of notes then in active circulation, *i.e.* in the pockets and tills of the people. No bank ever issues the notes of any one of the other banks.

The notes are, by the system described above, "cleared" to a great extent independently of the ordinary settlement of drafts and bills between the banks. The system is a very convenient one, and saves the banks concerned a great deal of labour.

All clearing-house balances, other than those arising at the Edinburgh clearing-house, are settled by drafts on Edinburgh, which pass through the clearing-house there, and the balances of the Edinburgh clearing-house are settled bi-weekly by transfers of cash made in London four days later. Interest at 3 per cent is paid by the debtor banks on balances until the date of final settlement in London.

EXCHANGE BROKER. Unlike the bill-broker (see BILL-BROKING), who in most cases is really a *dealer* in bills, which he buys and sells for his own account, the exchange or *foreign bill* broker is strictly what the title of his calling implies, namely, an intermediary or negotiator between the buyers and sellers of bills of exchange drawn on foreign countries.

Such bills fall into two classes; those drawn from the provinces, and those drawn from, or held in, London. As regards the former, all practically pass through the country banker into the hands of his London agent for negotiation, and, as the latter does not attend 'Change, they are, without exception, sold through brokers. In the case, however, of London-drawn paper, or of such as is remitted to London houses, the seller is quite at liberty, if he so chooses, to go on 'Change and save the brokerage by offering the bill for sale himself; but he usually finds it to his advantage to employ a skilled agent.

The exchange broker must be sufficiently familiar with foreign law and custom to be able to point out and explain any irregularity of form, stamp, or endorsement, etc., in the bills that pass through his hands. He ought also to be competent, besides knowing the present state of the exchange, to form an opinion as to its probable course, in order to advise his client, if need be, when best to buy or sell. He is also expected, when executing a buying order, to protect his client's interest by exercising a due regard to the financial and moral standing of the parties to the bill.

On concluding a bargain, the broker makes it legally binding by passing a contract note to both parties, giving particulars of the bill and specifying the rate at which it has been sold. In the buyer's copy he also fills in the name of the party who has to deliver, and in the seller's that of the party who has to receive and pay. Payment, it may be added, is not effected through the broker, as in stock exchange transactions, but the principals settle direct on the following day. The charge for brokerage is nominally one per mille (2s. per cent), but is subject to modification. Brokerage accounts are rendered once a year.

The growing tendency to effect settlements by bill on London, instead of by bills drawn from England on abroad, is strikingly illustrated by the fact that, notwithstanding the enormous increase in our foreign trade in the last half-century, the number of exchange brokers has only risen, according to the Post-Office Directory, from 13 in 1841 to 16 in 1893, as against an increase during that period in the number of London stock brokers from 343 to upwards of 3000. G. C.

EXCHANGER, ROYAL. The chief functions of the king's or royal exchanger were as follows: to buy bullion for coin save where private mints existed, to exchange current coin of one metal or denomination for that of others, and to exchange foreign and English coins.

In the reign of Henry I. we find this office and that of moneyer united and vested in one person. But this union did not continue. Succeeding kings separated the office of exchanger and developed its constitution. Thus Edward I. had tables of Exchange set up in various places, as York, Dover, Canterbury, etc. In addition to the other and more ordinary ser-

vices which he performed, the exchanger and his subordinates were entrusted with the important duty of so discharging his office that the export of precious metals from the country might be prevented. He continued a royal functionary and in discharge of his duties till the reign of Henry VIII. Then the complaints of the goldsmiths and the advice of Sir Thomas Gresham were listened to, and in 1539 the office of the royal exchanger was abrogated on the ground that its charges and action impeded traffic. Despite a nominal restoration in 1546, the previous date may be regarded as marking the termination of this restraint on the exchange. Statesmen and theorists were, however, very much divided as to the expediency of this action, and the protests against the extinction of the office proceed from well-known men, as for instance, Sir Robert Cotton.

Its reconstitution was mooted at the very beginning of the reign of Charles I. (in 1626). The goldsmiths were heard in opposition in the privy council, but did not prevail. On 25th May 1627 the revival of the exchanger was announced, and the king appointed "Henry, Earl of Holland, and his deputies, to have the office of our changes, exchanges, and outchanges, whatsoever, in England, Wales, and Ireland," for a period of thirty-one years. The goldsmiths petitioned, and the House of Commons protested against this reconstituted office. The Earl of Holland offering to submit his office to the judgment of the latter body, a debate took place, and it was agreed that it was a "grievance." No steps seem to have been taken to exercise any jurisdiction, and no attempt was made subsequently to revive this ancient office.

EXCHEQUER.

Exchequer, Early History of, p. 779; Exchequer, present constitution of, p. 781; Exchequer, Scotland, p. 784; Exchequer Bill, p. 784; Exchequer Bill, History of, p. 784; Exchequer Bond, p. 785; Exchequer Bond, History of, p. 785; Exchequer, Closing of, 1672, p. 786.

EXCHEQUER, EARLY HISTORY OF. The Exchequer, *i.e.* the department of government which superintended and managed the king's revenues, and into which all dues were paid, appears as an organised part of the state system in Norman times. In Early English times there seems to have been a treasury, sometimes at Winchester, sometimes at Westminster, while a hoard was kept in the king's chamber, and local treasuries were found in some provincial towns (Hall, *Antiquities of the Exchequer*, p. 3), but there are no traces of a court of account so early. Richard, Bishop of London, the treasurer, son of Bishop Nigel of Ely, and our chief authority for the early history of the exchequer, writing in 1178 (Liebermann, p. 11), states that it dates from the Norman Conquest, the arrangement being taken from the exchequer across the seas (*Dialogus de Scaccario*, i. iv.). Though this fact of a Norman origin for the English exchequer cannot be proved, it is probable that both came into existence about the same time; even if entirely independent, the English exchequer is certainly not much older than the Norman; while on the other hand, some of its peculiarities, such as the "blanch farm," show that the system was not borrowed in its entirety from Normandy.

In Henry I.'s time it is found as a distinctly organised department and as a court of law under the name "scaccarium," a name derived from the chequered cloth which covered the table at which the accounts were made up. All the financial business of the crown was carried on at the exchequer, and as in early times the regulation of finance and the administration of justice were intimately connected, much judicial work fell for a while under its control, until, with the elaboration of the judicial system, new courts arose, and until its authority was restrained by Magna Carta, by the statute of Rutland (12 Edw. I.) and by other statutes, to cases which directly affected the revenue. This close connection between justice and finance is indicated by the fact that the officials who sat as *justitiarii* in the curia regis, the supreme judicial court, sat also in the exchequer as *barones scaccarii*. These were the great officers of the household and others specially named by the king, presided over by the king or by his representative, the chief justiciar, until the final disappearance of that official in Henry III.'s reign, when the treasurer, always an important functionary, took the foremost place. The treasurer, who was assisted in the performance of his duties by the chamberlains, had indeed the superintendence of every department, and was responsible for the compilation of the great roll, the annual record of the crown dues, while he also gave directions for the execution of the royal writs. The chancellor, the representative of the equitable jurisdiction, acted as nominal guardian of the great seal, and also as a check upon the treasurer, whose roll was copied by one of the chancellor's clerks. The constable, with clerical assistance, made payments to the royal officers and others upon receipt of the king's writ, for without such a warrant the issue of money was strictly forbidden. To cut the tallies (see TALLY), used as receipts, a cutter of the tallies was employed. Under these more important dignitaries were a large body of officials, sitting in the lower chamber, who prepared the summonses and other business, and acted as fiscal experts. Some of these offices were held in fee, and mention is found of a woman hold-

ing office as chamberlain and acting by deputy (Hall, p. 82).

Full sessions of the exchequer were held at Easter and at Michaelmas, generally at Westminster, although instances of its session elsewhere are found as late as the reign of Edward II. (Madox, ii. p. 7). Other sessions were held during the Hilary and Trinity terms, and whenever it was deemed necessary, not excepting Sunday (Thomas, p. 7).

Manifold were the duties of the officials in connection with the revenue; not only did they receive payments from the sheriffs and others responsible for debts to the crown after careful examination of the accounts, but they also directed payments to be made to meet the royal requirements, and met administrative expenses of all kinds.

Business was carried on in two departments.

(1) The upper chamber, known as the exchequer of account (*scaccarium majus*), where the reports of the sheriffs and of others were received, and where all legal negotiations were carried on.

(2) The lower chamber or exchequer of receipt (*scaccarium inferius*) where the money was paid down, weighed, and tested, and from whence it was issued when necessary. The proceedings in the case of a sheriff, the most important of all accountants, may be taken as typical of the method adopted in transactions with the customers, escheators, bailiffs, and others responsible for the collection of the revenue.

At Easter the sheriff having received a summons and a statement of the items for which he had to account, appeared in person at the exchequer, unless excused for special reasons, when an attorney of suitable rank might act as his representative. The view of his account was then taken, and a proffer was made by him, being generally an instalment of half the total amount for which he was responsible. In return he received a receipt, known as a *tally*, the counterfoil of which was retained at the exchequer. When summoned to the Michaelmas session, the sheriff was required to answer for the full annual dues "in money or in tallies"; he then presented the tally or the voucher which represented such payments or allowances as might already have been made, together with the remainder still due in cash, and received full quittance of his obligations. A simple expedient for balancing the liabilities and the actual payments of the sheriff was devised by means of counters placed upon the squares of the chequered table, those on the one side of the table representing the value of the tallies, warrants, and specie presented by the sheriff, and those on the other the amount for which he was liable, so that it was easy at a glance to see whether the sheriff had met his obligations or not. In Tudor times "pen and ink dots" took the place of counters, and are found in use for the last time in 1676 (Hall, *Antiquities of the Exchequer*, p. 131).

Depreciation of the coinage through wear and the possibility of fraud led in early times to the adoption of precautionary measures. Thus when money was paid by tale a payment of sixpence on every pound was added to make good any possible deficiency; this was found to be inadequate, and in place of such a payment *ad scalam*, a payment *per pensum* was demanded, by which any deficiency in the actual weight had to be made up, or a composition of one shilling in the pound was exacted. In some cases the coin was submitted to a smelting test; this was generally done with the farm of the county, which was said to be blanched or dealbated, when such a test or a composition in lieu of it had been accepted. A regular staff of officials was employed in the exchequer of receipt to see that *real combustion*, *i.e.* the actual testing of bullion, or *nominal combustion*, *i.e.* the additional payment offered as a substitute, was not evaded by the king's debtors (see ASSAY).

Among the important records bearing on the work of this department, and carefully guarded by successive generations of officials, in hampers and chests, were the Domesday book, the most ancient record of the liabilities of crown tenants, the Red and Black Books of the exchequer, and other similar compilations; the most important for centuries was the great roll of the exchequer, commonly known as the Pipe Roll or *Rotulus Annalis*, the official register of all debts due to the crown arranged under the heads of counties, drawn up annually under the superintendence of the treasurer, and which served as the supreme authority by which the sheriffs and other accountants were judged. The first of these rolls still extant is that for 31 Henry I. (1130), but from the second year of Henry II. the series is complete. A duplicate of this roll was prepared for the chancellor, who closely checked any error on the part of the treasurer, while at the date of the compilation of the dialogus a third roll was transcribed for the king (*Dialogus*, I. vi.). In later times with the expansion of royal revenue a number of other rolls dealing with special parts of it became necessary (Thomas, *Ancient Exchequer*, p. 68). As attendance on the king and their duties in the various courts prevented the great officials from regular attendance at the exchequer, and as the sources from which the revenue was derived changed, various new officers were appointed to meet the demands in different directions. Thus as the chancellor and his subordinates became engrossed by the business of the chancery, their places were taken by the comptroller of the pipe and the chancellor of the exchequer (Thomas, p. 100), the latter official being often mentioned from the reign of Henry III. onwards, when the remembrancer

is also first heard of, keeping the memoranda roll, upon which were entered points left for consideration until the close of the audit, and acting in the capacity of solicitor to the treasury (see PIPE ROLLS). Towards the end of Elizabeth's reign the number of officials reached its highest point, and it is also noticeable as the time when the lord high treasurer, as he was now called, began to act less frequently in person at the exchequer and more by means of written instructions, and this gradually led to a new system for the conduct of business (Thomas, p. 21). Upon the death of the Earl of Salisbury in 1612 the treasury was for the first time put in commission, and since verbal orders could not be accepted at the exchequer from several persons, written instructions became a necessity, and led to the use of treasury warrants, which again paved the way for the modern department of the treasury. There is evidence that the lord high treasurer still acted in person until the removal of the exchequer to Oxford in 1643. Finance under the commonwealth was managed by committees of revenue until Cromwell revived the exchequer in 1654, and put the treasury in commission, which has been its normal condition since that time. During the Great Fire of 1666 the exchequer was moved for a while to Nonsuch (Hall, 76). In the course of George III.'s reign many of the old offices were gradually swept away, until in 1833 the ancient account and receipt departments of the exchequer were entirely abolished (3 & 4 Will. IV. c. 99; and 4 Will. IV. c. 15), the office of queen's remembrancer being the sole relic to-day of the early system, for the work of the exchequer is now undertaken by the modern departments of the paymaster-general and the treasury, while the Bank of England has taken the place of the old exchequer of receipt. See BUDGET; EXCHEQUER, PRESENT CONSTITUTION OF; JEWS, ECONOMIC INFLUENCE OF (for exchequer of the Jews); PIPE ROLLS; TALLY; TREASURY.

EXCHEQUER, PRESENT CONSTITUTION OF. The Exchequer is the national purse or receptacle into which (*a*) all the public revenues are paid, and out of which (*b*) all public expenditure is defrayed. The moneys paid into the exchequer constitute in the aggregate the consolidated fund of the United Kingdom (see CONSOLIDATED FUND), of which the local situation or receptacle is in practice at the Banks of England and Ireland, where all such moneys are carried to a general account, operated upon by the commissioners of the treasury, and known as the "Consolidated Fund Account," or Exchequer Account.

a. The following is the machinery by which the exchequer is supplied, viz.:

In the fiscal system of the United Kingdom the financial year does not coincide with the calendar year, but is reckoned from the 1st of April to the 31st of March. Towards the close of one financial year or beginning of the next—that is to say, in the month of March or April—the chancellor of the exchequer lays before the House of Commons his budget (see BUDGET), which is a statement of the revenue and expenditure of the outgoing, and the estimated revenue and expenditure of the incoming, year. He first estimates the revenue of the incoming year on the assumption that the existing scheme of taxation will be continued unaltered by parliament. If he considers that on this basis the revenue of the year will exceed the expenditure, he generally proposes to abolish or reduce certain taxes; if the contrary, to raise, increase, or extend them. It is not necessary that the scheme of the chancellor of the exchequer, so far as the revenue which he anticipates is founded upon the existing basis of taxation, should be sanctioned as a whole by parliament; for, in the absence of an enactment to the contrary, all taxes and imposts go on from year to year without express legislative renewal, except the tea-duty and the income-tax. If, therefore, the House of Commons approves of the budget proposals, all that is necessary, in the first instance, is that it should, by resolutions passed in committee of ways and means, sanction the levy of tea-duty and income-tax during the financial year, at the old rates, or at new rates proposed by the chancellor of the exchequer, as the case may be; and that it should also sanction by similar resolutions any changes which he proposes in other duties or taxes. These resolutions are subsequently confirmed, as soon as the exigencies of parliamentary business will allow, by acts of parliament, for example, see the customs and inland revenue act of 1892, 55 & 56 Vict. cap. 16. At this stage the arrangements for supplying the exchequer with the necessary revenue during the financial year are formally complete. The commissioners of customs and of inland revenue, acting under the directions of the commissioners of the treasury, levy the duties and taxes prescribed by statute; the post office continues from

year to year its profitable labours; and the moneys derived from these several sources are, together with the hereditary revenues of the crown, and certain other miscellaneous items, paid in by their collectors as they accrue to the exchequer account at the Banks of England and Ireland.

b. Such is the manner in which the exchequer is filled. It is now necessary to explain the procedure by which its treasures are disbursed. From the foregoing account it will be seen that the levying of the national revenue is completely under the control of parliament. The control of parliament over the national expenditure—or, in other words, over the disbursements of the exchequer—is no less, in fact if anything it is more complete. The expenditure of any given year is divided into two classes. 1. The first consists of charges, more or less permanent in their nature, which are authorised by act of parliament either for a given period or until the act authorising them has been repealed. These charges therefore do not form the subject of an annual vote of parliament, but are paid as they fall due under the authority of the act which grants them. They are called fixed charges on the CONSOLIDATED FUND (*q.v.*), and comprise the interest, sinking fund, and cost of management of the public debt; the civil list, or dotation of the crown; the allowances to members of the royal family; certain pensions granted for public services; the salaries of the judges; and of certain high officers whose independence is thought to be better guaranteed by permanent grant than by annual vote. It appears from the finance accounts of the United Kingdom for 1891-92 that the sums issued from the exchequer on account of fixed charges on the consolidated fund amounted in that year to £29,009,499, or rather less than one-third of the total expenditure of the state for the year. 2. The ordinary charges of the military, naval, and civil government, as well as the cost of collecting the revenue, form the second class of the public expenditure. They are annually granted by parliament, and as they are in the first instance voted by the House of Commons in committee of supply, they are called the supply services (see SUPPLY, PARLIAMENTARY). The amount issued from the exchequer in 1891-92 on account of expenditure on the supply services is returned at £60,918,273, being rather more than two-thirds of the total expenditure of the year.

Money to defray a fixed charge on the consolidated fund is taken out of the exchequer under the authority of the special act of parliament which fixes the charges. The following is the machinery by which money for supply services is obtained.

The government submits to the House of Commons estimates of the sums which it requires, under the several heads or denominations of service, known as votes (as the House of Commons votes them). Each of these votes is discussed at such length as the House thinks proper, and any item in a vote can be rejected, but the House cannot add a penny to a vote, it being a constitutional maxim that expenditure can only be voted on the recommendation of the crown. Nor has the House of Lords any share in the matter. It is a co-ordinate branch of the legislature; but the privilege of voting the money of the subject is exclusively reserved to the representative chamber.

Suppose now that the House of Commons has voted the proposed expenditure. This alone would not enable the government to act; for, although the exchequer is being daily filled with the produce of taxes, it cannot be availed of without further parliamentary authority for defraying the expenditure which the House of Commons has sanctioned.

The House of Commons alone criticises and sanctions the proposed expenditure, but the doors of the exchequer cannot be unlocked without the authority of an act of parliament. Accordingly, acts are passed from time to time, each parliamentary session, authorising certain sums to be taken out of the exchequer to defray expenditure sanctioned up to date. These acts are often referred to as "ways and means acts." Their parliamentary title is "consolidated fund acts," and the language in which they are couched is instructive, as summarising the procedure of parliamentary supply, viz.:—"Most Gracious Sovereign.—We, your Majesty's most dutiful and loyal subjects, the Commons of the United Kingdom of Great Britain and Ireland, in Parliament assembled, towards making good the supply which we have cheerfully granted to your Majesty in this Session of Parliament, have resolved to grant unto your Majesty the sums hereinafter mentioned, and do therefore most humbly beseech your Majesty that it may be enacted, and be it enacted by the Queen's Most Excellent Majesty, etc., etc." (Then follow, after the usual preamble of an act of parliament, provisions authorising the treasury to issue certain sums out of the exchequer.) Thus the House of Commons *grants* the money; but the three estates of the realm conjointly authorise, by statute, the taking of money out of the exchequer. In the parliamentary session of 1892 three such Consolidated Fund Acts were passed (55 Vict. c. 3; 55 & 56 Vict. c. 20; 55 & 56 Vict. c. 33). The last of these acts passed each session is called the "Appropriation Act"; it sets out in detail all the votes which the House of Commons has sanctioned in supply, and applies to them, and to them only, the required sums of money out of the exchequer, thus strengthening parliamentary control over administration by making it illegal for the executive to expend upon one service

money which has been voted for another. This practice of *appropriating the supplies*, as it is called, dates from the Revolution of 1688.

Thus it will be seen that the control of parliament over the exchequer is complete. A fixed charge on the consolidated fund can only be paid on the authority of a special act of parliament, and a supply service can only be paid after it has been voted by the House of Commons in committee of supply, and after the disbursement of the necessary funds has been authorised by a consolidated fund act or ways and means act. But it may be asked what practical security is there that these conditions are observed and that ministers do not take money from the exchequer for purposes which parliament has not approved? The answer is that money is only issued out of the exchequer with the permission of an independent officer, over whom the executive government has no control, who guards the exchequer on behalf of parliament. This officer, styled the comptroller of the exchequer and auditor-general, only obeys the directions of the treasury to make an issue out of the exchequer when he has satisfied himself that the demand is for a service authorised by parliament. It may next be asked how does parliament provide against ministers obtaining money from the exchequer for a purpose which parliament has authorised, but spending it upon some other purpose? This danger is guarded against by the fact that every department to which public money is issued is obliged, under the Exchequer and Audit Act (29 & 30 Vict. c. 39), to render an account of the disposal of such money to the officer above mentioned, the comptroller of the exchequer, etc.

It will here be proper to say a word as to the difference between the "committee of supply" and "committee of ways and means" in relation to public finance. In committee of supply the House of Commons determine how much money government shall be allowed to spend; in committee of ways and means it considers where the money thus authorised to spend is to come from. "The committee of supply considers what specific grants of money shall be voted as supplies demanded by the crown for the service of the current year, and explained by the estimates and accounts prepared by the executive government, and referred by the House to the committee. The committee of ways and means determines in what manner the necessary funds shall be raised to meet the grants which are voted by the committee of supply, and which are otherwise required for the public service. The former committee controls the public expenditure, the latter provides the public income. The one authorises the payment of money, the other sanctions the imposition of taxes and the application of public revenue not otherwise applicable to the service of the year" (May's *Parliamentary Practice*, p. 616, ed. 1879).

The grants which have been described are made by parliament to the crown, and the sovereign, by royal order, places them at the disposal of her finance department, the treasury. The treasury from time to time, as money is wanted, calls upon the comptroller of the exchequer to issue out of the exchequer the sums required, and the money so issued is paid to the account of the paymaster-general, who holds it at the disposal of the departments, subject to the control of the treasury.

Careful distinction must be drawn between the exchequer and the treasury. The exchequer is the national purse, the treasury is the finance department of the state, which controls the exchequer, on behalf of the executive government, subject to the check and audit of the comptroller and auditor-general acting on behalf of parliament. The treasury is governed by a board of commissioners, of whom the chancellor of the exchequer is one. The treasury, through the chancellor of the exchequer, moves parliament at the commencement of the financial year to provide the means of carrying on the government. It is to the account of the treasury, the exchequer account, that all public moneys are paid into the banks of England and Ireland, and it is the treasury again which, when the supplies granted to the crown by parliament have been placed by the sovereign at the disposal of her finance department, the treasury, supervises and controls the expenditure of such supplies throughout every branch of the public service. The duties of the treasury, as the department responsible for the administration of the exchequer, are thus summarised by Mr. H. D. Traill in his *Central Government* (English Citizen Series, 1881), viz. :—

1. To provide the means of meeting the necessary yearly expenditure on the military, naval, and civil services of the nation.

2. To exercise a general control and supervision over the amount and details of that expenditure.

3. To revise and regulate the internal or domestic expenditure of the other public offices of the state, and generally to exercise such a superintendent authority over the financial management of such offices as is implied in these revisory and regulative powers.

4. To decide upon appeals from its own subordinate departments in all cases arising out of the receipt of revenue, and

5. To determine as to the remission of fines and forfeitures due to the crown.

The board of treasury consists of five commissioners, namely: the first commissioner or first lord of the treasury, an office which is generally held by the prime minister; the

chancellor of the exchequer; and three other commissioners, known as junior lords of the treasury. The financial powers of the treasury are in effect centred in the chancellor of the exchequer, who may therefore be described as the finance minister of the United Kingdom.

EXCHEQUER (SCOTLAND); originally a department or committee of the Scottish parliament, by the Treaty of Union, Art. 19, this court was to continue until a new revenue court should be established in Scotland. By 6 Anne c. 26, a new exchequer court was established in Scotland on the English model, the judges being the lord high treasurer of Great Britain, the lord chief baron, and four barons of exchequer. It was an attempt to establish a common judicatory for England and Scotland, and all members of the English or Scottish bars were entitled to plead before it, and the privileges of senators of the Scottish college of justice were conferred on the barons. It had exclusive jurisdiction over customs, excise, and other revenues of the crown, and all honours and estates accruing to the crown, and the gift of the office of tutor dative, or guardian appointed by the court. English forms of procedure were to be used. Other powers were the passing of sheriffs' accounts, superintending the administration of the sovereign's feudal superiorities, dues, and fines of crown vassals, etc. By 3 Will. IV. c. 13, all powers of this court bearing on revenue were transferred to commissioners of the treasury in London, but its legal jurisdiction was preserved. Other statutes modified and altered the court. Finally by the court of exchequer, Art. 1856 (19 & 20 Vict. c. 56) it was abolished as a separate court and all its former jurisdiction was transferred to the court of session, becoming the revenue department of that court. The English forms and terms were assimilated to those of the court of session, and one of the lords ordinary to be named by the crown was to act in exchequer causes.

EXCHEQUER BILL. This is one of the securities on which the British exchequer customarily raises money for temporary purposes. The bills are usually dated March or September, occasionally June, and bear a specific rate of interest never known to exceed 5½ per cent, or to fall below 2 per cent. The bills do not specify the date of redemption, but bear a sheet of coupons, payable half-yearly at the specified rate of interest. The rate of interest is variable from year to year, and if the holders of exchequer bills are not satisfied with the rate advertised by the exchequer, they have their remedy in the way of payment of exchequer bills instead of cash for customs, excise, or other duties due to the Government—that is, supposing the bill is paid in during the latter part of any year from the original date; otherwise the holder has the option of renewing the bill, and often does so, supposing the interest to be satisfactory. A. E.

EXCHEQUER BILL, HISTORY OF. Exchequer bills are a form of security on which the government, under the authority of parliament, may borrow money for the service of the state. They have been in use since the year 1696, and had their origin in the scarcity of the circulating medium during the great recoinage at that time. Their invention as a substitute for "money" is attributed to Charles Montague, the chancellor of the exchequer in William the Third's reign, and may be said to have been the first introduction of a paper currency organised by the state.

The first exchequer bills were issued under the authority of 7 Will. III. c. 31, and were to "pass in payments from any person or persons to any other person or persons that shall be willing to accept and take the same." They were made out in sums as low as £5 and £10, and were to bear a daily interest not exceeding 3d. per cent per diem. The object of the inventor of these bills, however, was not realised. They were received with so little favour that, out of £1,500,000 authorised to be issued, only about £160,000 got into circulation; an amount too limited to give any relief to the monetary difficulties of the time. In 1697, under Acts 8 & 9 Will. III. c. 8 and c. 20, their use was considerably extended by making them pass in payment of all taxes, duties, etc., and "in all payments at the exchequer due to the king." Originally exchequer bills were, like the ordinary loans at the exchequer, charged upon the produce of certain specified duties imposed or renewed by the act authorising the issue of the bills. As, however, it frequently happened that the duties so appropriated proved insufficient to pay off the loans raised thereon, it subsequently became the practice to make the bills payable out of the general supplies granted by parliament year by year. This practice did not extend to the bills charged on the annual malt duty and land-tax, which duties continued to be specially appropriated, although they often were deficient and had to be made good out of the supplies of the following year. In 1763-64 exchequer bills entirely superseded the old form of loans at the exchequer, and for a period of ninety years, *i.e.* until 1853, continued with one or two exceptions to be the only form of temporary security on which money was borrowed either to meet the ordinary service grants of parliament or for loans granted for purposes of a local character. Amongst the latter may be mentioned the building of churches, public works, poor relief, Irish tithes, Shannon navigation, relief of West India proprietors, etc. The

largest amount of exchequer bills issued in any one year was in 1813, when it reached the total of over £54,000,000. The amount of exchequer bills in circulation has at various times been reduced by a process called "funding," *i.e.* by the creation of "funded debt" in lieu thereof. The usual course was to offer government stock to the public at a given price to be subscribed for either in exchequer bills, or money, or both. The bills so subscribed were cancelled, and the money subscribed was applied in paying off other exchequer bills on their maturity. In cases where the bills required to be funded have been held entirely by the Bank of England or by the national debt commissioners, the exchange of bills for stock has been effected by arrangement, but always under statutory authority. The first instance of funding was in 1709, when exchequer bills with the accrued interest thereon, together amounting to £1,775,000, were funded. Until 1797 there were only two further fundings, viz. £2,000,000 in 1717 and £986,800 in 1746. From 1797 to 1858, when the last "funding" of exchequer bills took place, no less a sum than £143,000,000 was cancelled by the creation of funded debt, of which about £105,000,000 was cancelled during the period of twenty-five years, from 1797 to 1821 inclusive. The largest amount of exchequer bills funded at one time was £27,262,000 in 1818-19. In 1861, under the provisions of Act 24 Vict. c. 5, exchequer bills ceased to be issued annually and to bear a daily rate of interest. The issue of exchequer bills at the present time is regulated by the Act 29 Vict. c. 25. They are of the nominal value of £100, £200, £500, or £1000, and are current for a period of five years, but they may be sent in for payment, after due notice, at the expiration of each twelve months from the date of the bills during their legal currency, and may be paid in for customs or inland revenue duties at any time in the last six months of each year of their currency. The rate of interest is fixed and advertised by the Treasury every half-year, and varies with the rate of interest prevailing in the money market at the time. The bills are prepared and issued by the Bank of England who receive an allowance for the management of the same. There has been no new issue of exchequer bills, beyond the periodical renewals, since 1861. They have been gradually superseded by Exchequer Bonds and Treasury Bills (*q.v.*).

The amount of exchequer bills outstanding on the 31st March 1892, as shown by the finance accounts of the United Kingdom for 1891-92, was £3,588,400, of which £1,492,700 were June bills and £2,065,700 March bills, so called on account of the date of their issue. G. H. H.

Exchequer Bond. Unlike exchequer bills, these securities run for a specific period, say, two or three years from the date of issue. The bonds bear coupons, but may be registered or inscribed in the books of the Bank of England, in which case no coupons would be available, and the half-yearly interest would have to be applied for personally. A. E.

Exchequer Bond, History of.—These are securities on which money may be borrowed by the government under the authority of parliament. They are regulated by the Exchequer Bills and Bonds Act (29 Vict. c. 25), but they differ from exchequer bills by being issued for fixed periods, generally for one to three years, and bearing a fixed rate of interest. In the absence of any special provision in an act authorising money to be raised by this security, the principal of exchequer bonds is repayable by votes of parliament. Formerly, when bonds had matured, and it was found necessary to replace them by new bonds, special statutory authority had to be obtained in each case. It is usual now to take power in the act authorising the issue of bonds to replace them on maturity by new bonds or other securities. Exchequer bonds may, under treasury warrant, be delivered up to be registered or inscribed in the books of the Bank of England, and transferable certificates issued in lieu thereof. This class of security has generally been made use of for special services only.

Exchequer bonds were first introduced in 1853 by Mr. Gladstone, in connection with his scheme for redeeming or commuting certain three per cent stocks and South Sea annuities. Under 16 Vict. c. 23, holders of these stocks were offered, as one alternative, the option of taking exchequer bonds in exchange for their stock. The bonds were to be payable to bearer, so as to be readily transferable; to bear interest at $2\frac{3}{4}$ per cent per annum payable half-yearly until 1864, and thenceforward at $2\frac{1}{2}$ per cent per annum until 1894. They were to be offered for sale, the proceeds to be applied in paying off dissentient holders of stock, and they could be issued in exchange for and in cancellation of exchequer bills; only £418,300, however, were issued, of which £408,900 were in cancellation of exchequer bills. Subsequent acts made these bonds repayable out of moneys voted by parliament, and until such time interest would continue to be paid at $2\frac{1}{2}$ per cent. Power was also taken to replace them in 1894 by new bonds, to be issued for any term not exceeding six years. There was an issue in 1854-55 of £6,000,000, for periods not exceeding six years, to defray expenses connected with the Russo-Turkish and South African wars. Between 1874-75 and 1879-80 £7,750,000 was borrowed from the National Debt Commissioners on exchequer bonds with three years' currency, for the purpose of granting loans to local authorities for public works. By 44 & 45 Vict. c. 55 they were converted into permanent funded debt. In 1876, under 39 Vict. c. 1, £4,000,000 was borrowed on

exchequer bonds, also from the National Debt Commissioners, for the purchase of 176,602 shares in the Suez Canal Company, and repayable at any time not later than 1912. An advance of £400,000 in 1885-86 to the government of the Cape of Good Hope for the construction of a railway was provided by the issue of exchequer bonds repayable by moneys voted by parliament. The colony repaid the advance in 1890, and the bonds were paid off as provided. The interest on the bonds was paid by the colony. Under the National Debt Redemption Act 1889 (52 Vict. c. 4) bonds to the amount of £18,100,000 were issued to pay off holders of three per cent stocks who had dissented from Mr. Goschen's conversion scheme of 1888. Of this amount, bonds for £12,800,000, which were held by the national debt commissioners, were, by the National Debt (Conversion of Exchequer Bonds) Act 1892, converted into permanent funded debt. A small issue was made in 1892 for money borrowed under the Naval Defence Act of 1889 (52 Vict. c. 8). The total amount of exchequer bonds now outstanding is about £6,500,000. G. H. H.

EXCHEQUER, CLOSING OF THE (1672). The only part of the public debt which was incurred before the revolution of 1688 originated in the closing of the exchequer on 2nd January 1672-73. Maladministration of the finances, the sale of Dunkirk, and the disastrous close of the first Dutch war, undermined the credit of Charles II., which had been good for some years following the restoration. In 1666 the Commons proposed to appoint commissioners to examine the accounts of those through whose hands the money granted for the war had passed. The bill was delayed in the Lords till the prorogation. Commissioners were appointed two years later, and in consequence of their report the treasurer of the navy was expelled the House of Commons. It was therefore impossible to apply to the Commons for further supplies to execute the secret treaty with Louis XIV. which Charles signed at Dover in May 1670. In the emergency it was suggested that the sum of £1,328,526, the total amount borrowed from the bankers and others on the security of the supplies, should be appropriated with a view to overcoming the financial difficulties of entering on the Dutch war. In 1667 Charles had published a declaration to secure inviolably the course of payments at the exchequer, both with regard to principal and interest. But, on 2nd January 1672-73, he issued a proclamation to the effect that all payments upon assignations at the exchequer would be suspended for one year. The consternation in the city was great; the bankers were unable to meet their engagements, and many people were ruined. To quiet the public mind, the king promised to pay 6 per cent while the money was detained, and in 1676 letters patent were issued, charging the king's hereditary revenue with the interest, which amounted to rather more than £79,000 per annum. This engagement was regularly kept until the year before Charles's death, when payment was stopped. The creditors tried for twelve years, without success, to get legal redress, until, in 1697, judgment was given against the government. Somers, the chancellor, afterwards set aside this decision, notwithstanding the fact that ten out of the twelve judges were opposed to him. The chancellor's decree was afterwards reversed by the House of Lords, and in 1699 it was enacted that after 25th December 1701 the hereditary excise should be charged with the interest of the principal sum, at 3 per cent, redeemable on payment of £664,263, or half the principal. The principal was never repaid, and in 1716 it was incorporated with other public debts in the general fund which was then established. It may therefore still be regarded as part of the national debt.

[Grellier, *History of the National Debt*, p. 12 *seq.*—Hamilton, *Inquiry concerning . . . the National Debt*, p. 66; *State Trials*, xiv. pp. 1-114. —Hewins, "Origin and Growth of the National Debt," *Co-operative Annual for 1889*, p. 228, 229. —Thorold Rogers, *The first nine years of the Bank of England*, 8vo, 1887.—Defoe, *Compleat English Tradesman*, 3rd ed. i. 164, 188, 346, 347, ii. 94. There are several pamphlets dealing with the subject; amongst these may be mentioned, *The Joyful News of Opening the Exchequer to the Goldsmiths* (*in a letter by the Author of the Bankers' Case*, Thos. Twine), 1677.—*The Case of the Bankers and their Creditors, by a true Lover of his King*, 1674.—*Considerations on the Goldsmiths' Letters Patent*, 1678. "His Majesty's (Chas. II.) patent to the goldsmiths for payment and satisfaction of their debt," 1677 (patent granted to Sir Robert Vyner for £416,724, and to eleven other "persons hereafter named" for sums ranging from £295,994 down to £1784, the interest at 6 per cent to be paid by the quarter).] W. A. S. H.

EXCISE, THE, is the name given collectively to those duties which in the fiscal system of the United Kingdom are levied upon commodities produced within the kingdom itself, as distinguished from customs duties (see CUSTOMS) which are levied at the ports upon commodities imported from abroad. The word *excise* (Latin, *excido*) signifies etymologically *something cut off;* as an excise duty may in effect be considered something cut off or deducted, for the benefit of the state, from the price of the article as paid by the consumer. If there were no duty the consumer would pay a lower price for the article. The price, therefore, that he actually pays includes the duty; whence it follows that the duty itself is something deducted or subtracted from the actual price paid. The price in fact is divided into two parts, one part being

subtracted from the whole for the benefit of the state, and the remainder going to the vendor.

Duties of this character, whether levied on articles produced at home or imported from abroad, were at first equally known as excise duties, but in revenue parlance the word has long been restricted to duties on native commodities, those on foreign articles being known as the customs.

An excise duty properly so-called belongs to the category of indirect taxes, because though levied on the producer, its burden really falls on the consumer. It is, however, the practice to classify under the general head of excise the railway duty on passengers, a direct tax; of which the real as well as the apparent incidence generally falls on the railway companies; and a large group of *assessed taxes*, being license duties paid to the state in return for permission to practise or follow certain sports, trades, or occupations; *e.g.* the dog, game, and gun licenses and the licenses on brewers, auctioneers, and pawnbrokers. For a considerable period previous to their introduction into England excise duties formed part of the fiscal system of Holland. They were first imposed in this country in 1643 by the Long Parliament in order to raise funds for the war against King Charles the First. The principal articles first subjected to the duty were ale and beer, cider, perry, and strong waters, to which was soon afterwards added a long list of articles of food and clothing, *e.g.* flesh, victuals, and salt, alum, copperas, hats, saffron, starch, and all manner of silks and stuffs. The prime necessaries of life—flesh and salt—were subsequently struck out of the list, but, nevertheless, the general tendency from the Restoration (1660) to the administration of Sir Robert Walpole was rather to extend than to restrict the operation of these imports.

Walpole, to whom the material progress of England is so deeply indebted, applied himself from the first to fiscal reform. His biographer, Archdeacon Coxe, boasts of him that "he found our tariff the worst in the world and left it the best." By economical administration and the maintenance of a strictly pacific policy in foreign affairs, he enabled himself to help forward the growing prosperity of the country by a substantial alleviation of the burden of taxation. One of the main objects to which he set himself was to make the exportation of our manufactures, and the importation of the principal articles used in them, as free as possible. The reforms which with this view he carried out belong rather to the history of customs than of excise; but in the department of excise proper his beneficent activity made itself felt in the abolition of some duties, the reduction of others, and the simplification of many more. The most famous and the greatest of all his schemes, though it ended in failure, was the bill for warehousing wine and tobacco, generally known as the *Excise Scheme*, which occupies so important a place in our fiscal and parliamentary history that it deserves a separate notice (see EXCISE SCHEME).

The history of the excise since the administration of Walpole cannot here be written *in extenso*. It contains few features of salient interest, nor does it record any convulsion such as that which was excited by his unlucky Excise Scheme.

It will be observed on reference to the following list that the greater part of the excise revenue is derived from taxes on alcoholic drinks. This is no new fact; more than a hundred years ago Cowper drew attention to it in some indignant lines in "The Task."

> "*The Excise* is fattened by the rich result
> Of all this riot, and ten thousand casks
> For ever dribbling out their base contents
> Touched by the Midas finger of the State
> Bleed gold for ministers to sport away."

Such indignation is perhaps misplaced; as it is obvious that taxation should be imposed on luxuries rather than on necessaries; and whatever may be thought of the wisdom of consuming alcoholic drinks, they certainly cannot be classed among the necessaries of life. The tendency of modern legislation has been to throw the largest possible burden of excise taxation on alcoholic drinks, and to exempt, as far as possible, other articles.

[The best authority on the history of excise is Dowell's *History of Taxation and Taxes in England* (Longmans, Green, and Co. 2nd ed., 1888, 4 vols. 8vo.]

List of the chief heads of excise revenue, during the financial year 1891-92, taken from the published *Finance Accounts of the United Kingdom for 1891-92*, viz. (net receipts)—

	£
Excisable Liquors, viz.—	
Beer Duty	9,851,822
Spirit Duty	16,480,199
Railway Duty	324,984
License Duties, viz.—	
Brewers	15,478
Spirits—Distillers and Rectifiers	10,476
Tobacco Manufacturers	7,019
Patent Medicine Vendors	7,185
Beer and Cider, and Beer and Wine	186,167
Spirits—Dealers	129,579
Spirits—Publicans	1,527,074
Wine and Sweets	70,103
Refreshment Houses	7,755
Tobacco Dealers	78,509
Dogs	419,809
Gun Licenses	92,624
Game Licenses	181,740
Male Servants	143,019
Carriages	474,084
Armorial Bearings	75,303
Auctioneers, etc.	82,382
Hawkers and Pedlars	18,720
Plate-Dealers	51,858
Pawnbrokers	36,645
Miscellaneous	17,160
Total	£30,289,694

The whole of this sum is collected by imperial officers acting under the direction of the commissioners of inland revenue, who in turn are by statute subjected to the directions of the commissioners of the treasury; but since the new arrangements initiated by Mr. Goschen, when chancellor of the exchequer in 1888, the proceeds of certain specified portions of the beer and spirit duties and of certain licenses are handed over direct to the local authorities throughout the kingdom, in substitution for the grants formerly made by parliament in aid of local expenditure (see Mr. Goschen's statement in the House of Commons of 26th March 1888, Hansard's *Parliamentary Debates*, vol. cccxxiv.). The amount thus payable to the local authorities out of the excise receipts of 1891-92 was £4,572,268, leaving (say) £25,717,425 payable to the exchequer.

The following are some of the duties that have been repealed, viz.—

Cider, 1830. Paper, 1861.
Bricks, 1850. Hops, 1862.
Soap, 1852-53.

EXCISE SCHEME, THE, is the name by which history knows the proposal introduced into parliament by Sir Robert Walpole in 1733 for applying what is now known as the bonded or warehousing system to tobacco, and afterwards to wine. Instead of paying duty, or giving bonds, on landing the tobacco, from Maryland or Virginia on the quays of London or Bristol, the merchant was to lodge his hogsheads in warehouses under the control of excise officers, to pay duty only as he took it out for home consumption, and if he took it out not for the home market but for re-exportation abroad, no duty was to be paid. The same system was to be extended to wine. Various advantages were claimed for the change. First, it would put an end to sundry gross frauds upon the revenue, from smuggling on an immense scale down to abuses, petty and great, which the iniquity of dishonest merchants, practising on discounts, allowances, and drawbacks, and the rapacity of lightermen and watermen, carried out at every port in the island. Second, the prevention of these frauds and the decrease of smuggling would be a great gain to the honest trader. Third, accompanied as it was by a simplification of rates, this cheaper and easier collection would be a great advantage to the revenue. Fourth, and much the most important of all, it would tend to make London a free port, and by consequence the market of the world. Such were the advantages claimed for the change at the time. But another, and not the least important, may be added, viz. that it anticipated and fulfilled the principle of Adam Smith's fourth canon of taxation, by taking as little as possible out of the pockets of the people beyond what it yielded to the revenue. The merchant, relieved of the necessity of paying the duty on the importation of the article, would have the use of his capital for a longer time, and would therefore be able to sell at a lower rate to the consumer. In fact the merchant would gain, and the state lose, the interest on the amount of the duty for the period between the importation and the sale of the article. The merchant's, and, through him, the consumer's gain would in practice be greater than the state's loss, as the rate of interest which he would require on his capital, in order to make his business remunerative, would greatly exceed the rate at which the state could borrow; and moreover the loss of the state was more than counterbalanced by the economy of the cost of collection, and the prevention of fraud, which the scheme involved.

Such was the famous excise scheme, which alone would suffice to establish Walpole's reputation as a finance minister far in advance of his age. But the public mind of the time was not sufficiently instructed to receive it; and the design had no sooner been bruited abroad than a popular outcry arose, one of the loudest and fiercest of which history makes mention, which shook his power to its foundations, and at no long distance of time compelled him to abandon the scheme. The parliamentary Opposition, whose motives need no explanation, used all their powers of misrepresentation against Walpole's plan, the object of which was to turn the customs duty on the importation of tobacco into an excise duty on its consumption, as a scheme for levying a general excise over the whole range of commodities. Food, clothing, and the other necessaries of life were, they declared, to be loaded with a crushing tax. Every man's house might be invaded at any hour by the excise officer. Every man's goods and all his dealings would be exposed to minute and ceaseless inquisition. A great standing army of revenue officers would be created, which would overturn Magna Charta,—even undermine parliament. Such were the misrepresentations to which the credulity and factious spirit of the people, and the general unpopularity of the excise as a whole, made them an easy prey. The whole country resounded with shouts of "no slavery, no excise, no wooden shoes." The majority in the House of Commons in favour of the measure went down from sixty-one on the first resolution to seventeen on a subsequent issue; and this dwindling of his supporters, combined with the growing frenzy out of doors, determined Walpole to abandon a measure which in the inflamed temper of the nation could hardly be put into execution without an armed force. "I will not," he said, in announcing his resolution to his friends, "be a minister to enforce taxes at the expense of blood."

The abandonment of the scheme was celebrated throughout the country with rejoicings as for a national victory; the crisis was long remembered; and it is noteworthy that the

popular feeling, many years after the occasion had passed away, found an exponent in the tory prejudices of Dr. Johnson, who in his dictionary defined "excise" as a "hateful tax levied upon commodities, and adjudged not by common judges of property, but by wretches hired by those to whom excise is paid."

For a compact and trustworthy account of Walpole's excise scheme the reader is referred to Mr. John Morley's *Walpole* (series of English Statesmen, Macmillan and Co.), from which the foregoing description is mainly taken.

Writing more than forty years after Walpole's failure, Adam Smith had still to lament that so excellent a scheme had not been resumed by subsequent ministers (*The Wealth of Nations*, bk. v. ch. ii.). The credit of resuming it was reserved for William Pitt, who notwithstanding the inevitable parliamentary opposition, carried it into law in 1789 (29 Geo. III. c. 68).

[E. Leser, *Ein Accise-Streit* (Walpole's Scheme), 1879.]

The amounts raised by means of the excise have varied much since the first imposition of the tax levied under this name. As the articles subjected to it have differed very greatly, an exact comparison is scarcely possible. In the earlier periods the excise was farmed out, and "in 1657 an offer was made to give, for the farm of the excise and the port duties, no less than £1,100,000 per annum" (Dowell, 2nd ed. vol. ii. p. 13). Up to the end of the 17th century, the yield scarcely altered. Dowell writes (p. 62), "the revenue from inland duties had varied considerably in different years. In 1700 over a million, it was in 1702 nearly £1,400,000." During the later half of the 18th century great additions were made to the tax, though Walpole's proposals were not accepted (see EXCISE SCHEME).

In this century the gross produce of the tax has been in round figures at the following dates:

1835 . . .	£15,200,000
1855 . . .	£15,300,000
1875 . . .	£28,400,000
1892 . . .	£30,200,000

EX. DIVIDEND. A stock exchange phrase, shortened, as usual, to signify that the price at which a given security can be bought or sold is exclusive of dividend, which has been, or is about to be deducted. Unless so specified, the security in question is *cum dividend*, meaning that the dividend or interest accrued since the previous distribution is covered by the purchase money. Certain securities, including corporation bonds, exchequer bills, Indian deferred paper, English mortgage bonds, never carry interest in the prices, which are quoted net, the buyer being charged interest up to the date of the completion of purchase (see EX. ALL; EX. NEW). A. E.

EX. DRAWING. This phrase simply means that in case of the DRAWING (*q.v.*) of bonds at par, the bargain is not to be affected by the price obtained by the hazard of drawing, and the buyer gets no benefit. Thus, a specific government bond might have been bought at 90 a week or two before the periodical drawing of such bonds, and the buyer would get £100 if his bond happens to be among the lucky numbers, unless the words "ex. drawing" formed part of the contract. A. E.

EXECUTION is the name of the procedure by which the judgment or order of a court of law is enforced. This is generally done by "writs of execution," which, in the case of judgments of the high court, are issued in the central office or a district registry, and directed to the sheriff of the county in which they are to operate. The usual writs issued in the case of money claims are writs of *fieri facias* (cp. FIERI FACIAS, WRIT OF), commonly called fi. fa. and WRITS OF ELEGIT (*q.v.*); money claims may also be enforced by so-called "garnishee orders," viz. orders by virtue of which the judgment creditor obtains a charge on debts owing to the debtor, or "charging orders" which affect stocks or shares standing in the debtor's name, or, if the debtor has an equitable interest in the property out of which the judgment creditor seeks to obtain payment of his debt, by the appointment of a RECEIVER (*q.v.*) Judgments for the recovery of land are enforced by "writ of possession," and judgments for the recovery of any property other than land by "writ of delivery" or "writ of attachment"; in the case of judgments directing a person to do any act, other than the payment of money, the disobedient party is subject to imprisonment through the instrumentality of a "writ of attachment" or through "committal," which two means of execution differ in form only. Imprisonment on account of the non-payment of money has been nearly abolished, and where it occurs it is punitive in its nature, and not merely a means of enforcing payment (see DEBT, IMPRISONMENT FOR). E. S.

EXECUTOR; the legal administrator of the personal estate of a deceased person. In Scotland if appointed by written nomination of the deceased he is called executor nominate, if by decree of the commissary court executor dative, the former answering to the English executor the latter to the English administrator. His title in either case is completed by *confirmation* (see CONFIRMATION OF EXECUTOR) which answers to the English taking out probate or letters of administration. A husband has in Scotland no absolute right to administer to his wife's movable or personal estate. In default of an executor nominate, a residuary legatee is preferred, then the next of kin, those in the same degree being entitled to be joined if they please, then the husband or wife of the deceased, then the creditors, and lastly a special legatee. An executor differs from a trustee in that an executor's duty is to distribute the fund, a trustee's to hold it.

[Currie on *Confirmation of Executors.*—M'Laren *on Wills*, ii. § 1657.—Dove Wilson, *Sheriff Court Practice*, 4th ed., 546.] J. W. B. I.

EXECUTRY (Scottish); the subject of an executor's administration; the whole of the personal estate of a deceased person, equivalent both to legal and equitable *assets* in England. J. W. B. I.

EXERCITOR (Scottish); a term derived from Roman law and implying one who employs a ship for his own profit in trade, and to whom the profits belong. It matters not whether he is the actual owner or only the freighter. He is liable for necessaries ordered by the master. His obligations properly fall in the first instance under the jurisdiction of the admiralty court.

[Bell's Pr., § 450.] J. W. B. I.

EXHEREDITATIO signifies, in Roman law, a testator's declaration in his will that he excludes from being his *heres* a member of his family belonging to the class of relations who cannot be passed over in the will in silence, but must either be appointed *heredes* or thus declared to be disinherited. E. A. W.

EX. NEW. This refers to the quotation of prices on the stock exchange for shares or other security, the holders of which are about to receive an allotment of new stock at what may be considered an advantageous price of issue. When these words form part of the contract, the seller retains the advantage, if any, and the buyer's right to the security is exclusive of any right to subscribe to the new issue (see Ex. All; Ex. Div.). A. E.

EXPECTATION OF LIFE, a term introduced by De Moivre, denotes the number of years which persons of a certain class, *e.g.* English males, live on an average after a certain age, *e.g.* 20; the average being obtained as follows. The number of years which each of a great many, say *n*, specimens of the class under observation, lives after the assigned age having been observed, the sum of these numbers is divided by *n*. The Expectation is thus the arithmetic mean of the *n* observed numbers (see Average). It is contrasted with another average of the same numbers, viz. the *Median* (see Average), technically termed the "equation of life." The term "expectation" is objected to by Dr. Farr as suggesting the latter rather than the former sort of average. He prefers to say *mean after-lifetime*. Comparing the two kinds of average, Neison seems to think that the expectation of life is not so well suited "for medical and other purposes in which it is required to determine the relative value of an improvement or other change which may have taken place within a given period of life."

(See Death-rate; De Moivre; Insurance; Mean Afterlifetime; Statistics.)

[Walford's *Insurance Cyclopædia*, article "Expectation."—Farr, *Vital Statistics*, pp. 279, 309.—Neison, *Contributions to Vital Statistics*, p. 100.—Report of the Registrar-General for 1885, Supplement.—Humphreys, *Journal of the Statistical Society*, 1883.] F. Y. E.

EXPEDITATION. By the Forest Laws (*q.v.*) all mastiffs or other large dogs kept within a forest had to be expeditated, *i.e.* maimed sufficiently to prevent them chasing the deer. According to the laws of Canute the dog was to be hamstrung, but by a charter of Henry II. a somewhat milder operation was allowed, three toes of one forefoot being cut off with a chisel, leaving the ball of the foot intact. For keeping an unexpeditated dog within a forest a fine of 3s., called "footgeld," was imposed, but before the end of the 15th century in many of the English forests this fine had become a customary payment, sometimes called "hound-silver," collected triennially, which formed no small item in the revenues of the forest owner.

[See Ducange, *Glossarium mediæ et infimæ Latinitatis*, Editio nova a L. Favre, Paris, 1884.—Manwood, *Forest Laws*, London, 1615.—Cowell's *Interpreter of Words and Phrases*, London, 1701.—Forest Accounts, some of which are quoted by Manwood.] A. H.

EXPENDITURE or SPENDING has two distinct meanings which are often confused.

1. Expenditure may mean simply the payment out of money, that is, the exchange of money for other goods. In this sense it does not imply any consumption of wealth on the part of any one, and it cannot be opposed to "saving." A man who saves £100 a year ordinarily expends or spends those £100, *i.e.* exchanges them for other goods, just as much as if he did not save anything. The things on which he expends them will be different, but the expenditure, unless of course the money is hoarded, will be the same.

2. Expenditure may mean payment of money for personal consumption on the part of an individual, and consumption, pure and simple, on the part of the community. In this sense it is rightly opposed to "saving." The £100 a year saved by an individual is not in this sense of the word expended or spent either by himself or any one else. It is simply the value in money of a part of the community's income, which, instead of being consumed, has been added to the capital of the country (see Saving, Productive and Unproductive). E. C.

EXPENSES OF PRODUCTION (see Production).

EXPERIENCE. Upon the value of experience in the study of political economy the most contradictory opinions have found adherents.

Some economists have expressed themselves as though political economy were a science similar in type to astronomy—as though all economic truths could be derived by strict deduction from one or two first principles,

such as "All men desire wealth," or "All men are averse to labour." Other economists have denounced general reasoning, and have laid exclusive stress on the accumulation of facts. They would apparently reduce political economy to the task of observing and recording particulars without any admixture of inference. These opposite opinions have rarely been held in their most extreme forms. But by stating them as forcibly as possible we may be assisted to detect the fallacies which they involve.

It will appear upon examination that neither of these principles can be carried out in its integrity. The attempt to carry out either would result in intellectual paralysis.

There has never yet existed an economist so rigorously deductive in his method as not to draw to some extent upon experience of economic phenomena. Many economists have indeed drawn upon a field of experience too restricted to justify dogmatic conclusions. Many economists have been too much influenced by the economic experience of their own time, or of their own country. Even this narrow experience they may not have studied exhaustively. They may have picked up their knowledge of it insensibly, here and there, bit by bit. It is thus that the man of business, as contrasted with the student, acquires his knowledge of economic phenomena. Ricardo, the greatest of those economists who are alleged to have been rigorously deductive in method, may be said to have acquired most of his knowledge in this way. Such knowledge, being very partial, may sometimes prove misleading. But even such knowledge has great influence upon the development of theory. Ricardo's economic theories would certainly have been different had he lived in another age than the nineteenth century, or in another country than England.

An economist strictly deductive in method could never get beyond his first premisses. The contrary seems possible because the economist who apparently deduces everything from first principles in reality weaves into his argument statements of fact and wide generalisations which have become so familiar that he and his readers forget how they were first acquired.

Nor has there ever yet existed an economist who merely observed and recorded. Those economists who aimed at this ideal have nevertheless written history. The writing of history involves processes of selection, comparison, and inference, in which the historian's mind is active. No two persons perform these processes in quite the same way, and it is extremely easy to make mistakes in performing them. It is not merely that historians often infuse their work with their own political or religious sentiments, with the prejudices of their own age or their own class. It is rather that the historian cannot construct a narrative out of facts without interpreting those facts. But he cannot interpret the facts without using his mind, without adding to, or rather, without transforming, those facts.

The object of all science, including political economy, is not merely to amass facts but also to explain them. Facts are explained in so far as they are successfully brought under general laws. The general laws are always at first hypotheses, or in the vulgar tongue, guesses—guesses at truth. Hypotheses are suggested by facts, and facts are interpreted by hypotheses. He who forms a hypothesis with hardly any knowledge of the facts is pretty sure to throw away his trouble. He who clings to a hypothesis once formed, neglecting or rejecting new facts, does worse, for he is trying to confirm himself in error. But to refrain from forming hypotheses is impossible to a reasoning creature, and, if it were possible, would be suicidal. The value of experience is not absolute but varies directly as the power of the mind which has the experience. One glance at the field of battle will suggest a decisive movement to the great general. The vicissitudes of a short and obscure life will give the great poet a key to human nature in its infinite variety. The scientific genius, although less brilliant, is not essentially different from theirs.

Whether in physical or in political science the master mind is that to which facts suggest their own explanation. F. C. M.

[Cairnes, *Character and Logical Method of Political Economy.*—Bagehot, *Economic Studies.*]

EXPERIMENTAL METHODS IN ECONOMICS. Experiment in the scientific sense has been well described as "putting in action causes and agents over which we have control, and purposely varying their combinations and noticing what effects take place" (Herschel, *Study of Natural Philosophy*, p. 76). In sciences such as physics and chemistry, in which the phenomena are amenable to arrangement, it is by far the most potent instrument of discovery. Where, however, there is not the same facility for easy manipulation, the inquirer is compelled to fall back on the less effective method of simple observation. Instead of creating instances for himself, he has to find them in nature, or wait till they are presented spontaneously to his view.

Economics, in common with the other social sciences, clearly belongs to the latter class. The phenomena of wealth are closely inter-connected, and are besides affected by the other forms of social activity. Hardly any economic event can be said to be the result of a single cause, it is rather the product of several contributory causes. Nor are the total effects of any one agency easily separable; they are combined with those of others in a whole which cannot be analysed. In technical language "plurality of causes" and "intermixture of effects," the

two great hindrances to the use of experiment (Mill, *Logic*, bk. iii. ch. x.), are generally present in economic facts. To secure the requisite isolation of any phenomenon selected for study is rarely possible. The most rigorous form of inquiry, known as the "method of difference," the essence of which "is the comparison of two instances, which resemble one another in all material respects, except that in one a certain cause is present, while in the other it is absent" (Keynes, *Scope*, p. 170), is plainly excluded, since we cannot introduce a single cause that will have only a measurable effect, nor can we be sure that the surrounding conditions remain unaltered. The "method of agreement" in which the instances compared resemble each other in only one particular is not merely inferior as an experimental resource, but is inapplicable to social phenomena. Two countries or periods that had one common feature would have more than one. In two classes of cases, however, experiment may be sometimes used, viz. (1) in reference to the premises or *data* of economic science, thus the "law of diminishing returns" admits of experimental proof; (2) More important than the preceding exception, which is rather apparent than real, are those cases in which, by deductive reasoning, it can be shown that the action of an economic force is limited, and then its working within those limits can be experimentally ascertained.

These exceptions notwithstanding, it may be said that scientific experiments (*experimenta lucifera*) are a very slight resource in economics.

The case is somewhat different with regard to practical questions. Legislative measures and individual actions are, if so intended, so many experiments on the social system. Thus if several countries, widely differing in other respects, have established a system of peasant proprietary with good results, while several other countries, also widely differing *inter se*, are without that system and show inferiority, we may argue that peasant proprietary is experimentally justified. The same reasoning would be applicable to commercial policy, and has actually been used in reference to the case of Victoria and New South Wales, but illogically, as a number of cases are required to exclude other influences.

Again, by applying special legislation, *e.g.* a particular kind of land tenure, to one part of a country, we can ascribe to its influence the special effects noticed in that district. Practical experiments (*experimenta fructifera*) may also be employed by means of (1) permissive legislation, or (2) temporary legislation.

Private persons also carry out practical economic experiments, as in the cases of profit-sharing (Leclaire), and the recent eight hours day experiment at Sunderland (*Economic Journal*, ii. pp. 755, 756). A large accumulation of instances may even give a very near approach to rigorous scientific proof.

A vaguer use of the term "experimental method" is common in continental and especially in French writers. J. B. Say, for example, declares that the true method of political economy is *La méthode expérimentale qui consiste essentiellement à n'admettre comme vrais que les faits dont l'observation et expérience ont démontré la réalité* (*Traité, Discours prélre*, p. x. 5th ed. 1826). Here "experiment" is used as synonymous with "experience"; it therefore includes observation and experiment in the strict sense.

Lewis, *Methods of Observation and Reasoning in Politics*, ch. vi. —Jevons, *Methods of Social Reform*, pp. 253 *seq.* —Léon Donnat, *La Politique Experimentale*, 2nd ed. Paris, 1891]. C. F. B.

EXPERT. An expert may be defined as a person possessing special knowledge of any science or art. Art is here taken in its most comprehensive signification, to include the useful as well as the fine arts, cooking or carpentry as well as music or painting. The opinion of an expert on matters connected with his own subject is more likely to be correct than the opinion of a man to whom that subject is almost or altogether unknown. But the degree in which an expert's opinion outweighs the opinion of the ordinary man will vary according to the nature of the subject.

For, first, the subject may be one with which the ordinary man has no acquaintance, or it may be one with which he is acquainted, although not so fully as the expert. Thus every man in his senses knows to some extent what food is wholesome, although he may not know so much on this point as a qualified doctor. Every man who can write has some power of comparing hands, although not so much power as belongs to an expert in handwriting. But only an expert in navigation can determine the exact position of a ship out of sight of land. Only an expert in astronomy can determine the probable distance of a fixed star from our planet. In such matters the judgment of the ordinary man is absolutely worthless.

Secondly, the subject may be so complex that no expert has more than a very imperfect knowledge of it. Political and economic science are characterised by this complexity. Upon political or economic questions the opinion of a man who knows much is far more valuable than the opinion of a man who knows little or nothing ; but even the opinion of the man who knows much affords a very imperfect security. Such complex questions often present different aspects to different classes of experts. Let us suppose that an opinion is required on the expediency of a law to regulate the hours of labour. At least five different classes of experts

are more or less entitled to be heard:—(*a*) The economist who has read and reflected upon the theory of economic phenomena; (*b*) the political philosopher who has read and reflected upon the theory of the state and of legislation; (*c*) the statesman who is familiar with the practice of government, and can judge what kind of laws it is usually expedient to make and possible to enforce; (*d*) the employer who has had the opportunity and the will if not the wisdom to discover how production can be carried on to the greatest profit; (*e*) the workman who has had the opportunity and the will, if not the wisdom, to discover what are the best conditions of life which he can obtain for himself; all these men can bring to the determination of the problem a knowledge which other men do not possess, and are entitled in a greater or less degree to speak with the authority of experts. One person might, of course, combine more than one of these characters, and might, therefore, claim a higher degree of authority.

Thirdly, the subjects of knowledge differ in the degree in which they excite passions such as prevent the expert from employing his intellectual superiority to its fullest advantage. On any subject, indeed, were it astronomy or textual criticism, the judgment of an expert may be disabled by vanity or love of contention. But on those subjects which immediately touch the interests of mankind, notably theological, political, and economical subjects, the judgment of the expert is more likely to be disturbed by his passions. These passions are at least as ungovernable in ignorant men. But wherever they prevail they lessen the interval between the ignorant man and the expert. For the finer the intellectual instrument the more it is disturbed by acute emotion. F. C. M.

EXPERTISE (French) is the legal process by which judges, when called on to decide special or technical cases, may appoint, on their own authority, or on the demand of one or both of the litigants, persons possessing the necessary knowledge or experience, called experts, to examine, and report on, the points at issue. The conditions under which those operations are conducted are laid down in Arts. 303-323 of the Code of Civil Procedure. One of the most frequent applications of the law is in the settlement of disputes between foreign importers and the French customs authorities relative to the class, quality, origin, or value of merchandise subject to duty. The first supplementary convention to the Anglo-French treaty of commerce of 1860 conferred on British importers in France the right to demand an *expertise*. When the Customs propose to exercise the right of preemption, the importer and the customs each nominates one of the experts. In case of disagreement the two experts choose an umpire, and if they cannot agree on the choice, the umpire is appointed by the president of the nearest tribunal of commerce. Objections were frequently made that the persons named as experts did not possess the necessary qualifications, and on the renewal of the treaty of commerce, in 1873, a protocol was signed, stipulating that they should be chosen from a list of merchants or manufacturers drawn up by the chambers of commerce in each locality having a customs bureau. A British chamber of commerce had just been founded in Paris, and that body submitted to the Paris chamber (French) the names of the principal British merchants in Paris, for them to be comprised in the list of experts; but the French chamber of commerce refused to nominate them on the ground of their foreign nationality, although British traders had previously been accepted as experts. The British chamber appealed to the Foreign Office, and on the intervention of the British ambassador the French minister of foreign affairs considered the claim a just one, and some of the names proposed were added to the list of experts in Paris. Those names were, however, subsequently removed from the list on the expiration of the treaty of commerce in 1881, and British importers who now have disputes with the French customs can only be represented in an *expertise* by a French merchant or manufacturer, who is naturally disposed to impede rather than to facilitate foreign competition in his own trade. There is no appeal from the decision of the experts in commercial affairs, when they agree, but civil *expertises* are still governed by Art. 323 of the Code of Civil Procedure, under which judges are not bound to adopt the opinion of experts if they are not convinced by it. T. L.

[*Lois du 27 Juillet 1822 et du 7 Mai 1881; arrêts de la Cour de Cassation, 30 Avril 1838, et 30 Janvier 1839.*]

EXPLOIT. The French verb *exploiter* primarily means simply to use in such a way as to make a profit out of. It is applied to such actions as working a mine or a railway, cultivating a farm, or publishing a newspaper. There are some things which it is admittedly improper to use in such a way as to make a profit out of them; it is disgraceful, for instance, to *exploiter* any one's credulity, ignorance, or good nature. Hence the word comes to have sometimes a bad sense. The socialists who teach that the capitalist obtains an illegitimate gain by employing men for wages have applied the term to his action in this bad sense. To *exploiter* men or labourers thus means to use them in such a way as to make a profit out of them, it being at the same time implied by the use of the word that this, though not perhaps disgraceful to an individual who does it under present circumstances, is fundamentally improper, and would not be allowed in an improved state of society.

It is almost exclusively in this bad sense that

the word "exploit" has been introduced into English. E. C.

EXPORTS AND IMPORTS, see IMPORTS AND EXPORTS.

EXPORTS, DUTIES ON. Duties on exports have been generally condemned by modern economists, but they survive in many of the British possessions as well as in some foreign countries. The history of these duties in Great Britain is merged in that of the customs revenue. The original customs duties were, in fact, duties on exportation. They appear to have been levied by prerogative of the crown from early times, but the first statute which imposed them was one of 3 Edward I.

Two somewhat diverse theories have been suggested as explanatory of the origin of these duties in England. One, which we find first indicated by Sir W. Petty, is adopted by Mr. Dowell (*History of Taxation*). It holds that the sovereign power simply levied a toll on all merchandise, whether inward or outward, as a reward for its protection of the merchant. The duties "were in the nature of a premium paid to the king for insurance." The analogy of the customs duties levied at Athens and at Rome (*portoria*) may be held to favour this view. The other theory is on the whole the more probable, and is that adopted by Mr. Hubert Hall (*History of the Customs*); the king's chief concern was to see that he got as much revenue as he could. He was from ancient times entitled to a purveyance or prise on certain classes of commodities—"if then these were conveyed beyond the kingdom the crown would suffer a possible loss to its state or dignity." When it was found that the wools and hides on which the king was entitled to the internal toll or prise were being exported and escaping taxation, he at once put on a countervailing export duty in order to secure his revenue (see PRISAGE).

It seems probable that these duties were adjusted at the discretion of the crown according to its necessities, and Mr. Hall thinks that immediately before the statute 3 Edw. I. "it is probable that the commuted prise on staple exports, such as wool, hides, and minerals, was taken at an average rate of half a mark per sack of wool or an equivalent bulk of woolfells, a mark per last of hides, and an *ad valorem* duty of 3d. on every librate or twenty solidi of lead or tin."

The Act of 3 Edw. I. (1275), which is the first instance of levying taxation by act of parliament, placed the export duty at

½ mark per sack (26 stone) of wool.
,, ,, per 300 woolfells.
1 ,, per last of leather.

These are the *custuma antiqua sive magna*, and the chief contributor to the revenue was the wool. In the thirty-second year of this reign the produce was as follows:

Wool at 6s. 8d. . .	£1501	0	9¼
Woolfells at 6s. 8d. .	57	15	1
Leather at 13s. 4d. .	0	8	7½
Total of the great customs	£1559	4	5¾

In February 1303 an agreement was made with the alien merchants, whereby they undertook, in consideration of the king's protection, to pay 50 per cent beyond the ancient customs on wool and leather, and certain fresh rates on other commodities whether exported or imported. Rates were specified for wax, cloth, and wine, and all other articles were to be charged 3d. in the pound of 20 shillings. These were the *custuma nova sive parva*.

The next development of the exports (as part of the customs) duties was by the statute of 49 Edw. III., which levied the due of tunnage and poundage, afterwards known technically as a subsidy. The poundage was a duty of 6d. on the pound-weight of all articles exported and imported.

With variations in the rate these two forms of export, and import, duty were continued on the same basis down to the Restoration in 1660. They were granted by the Commons for periods of years as a rule; sometimes for the life of the reigning sovereign. After Agincourt in 1415, such a life grant was made to Henry V., and the duties had gone up considerably, as follows:—

	From denizens.			From strangers.		
On wool per sack	£2	3	4	£3	0	0
On woolfells	2	3	4	3	0	0
On leather per last	2	3	4	5	6	8

and in the following reign the rate for wools, etc., was raised to £5 for strangers, and that for leather to £5 for natives. The subsidy of poundage had already been raised to 1s. on the pound-weight, and there was a special duty of double that amount on tin exported by strangers. In 1421 the yield of all the customs was £40,687, of which the great custom on wools, export duty, produced £26,036; in 1431 the total was £34,851, of which the greater proportion was derived from export duties. But the revenue appears to have been a falling one; the customs regulations were anything but complete, as is shown by the act of 27 Hen. VIII. c. 14, to regulate the exportation of leather from other ports besides Southampton and London; and there were constant interferences with the export trade by way of partial or complete prohibition, as late as Mary's reign. In 1570 the value of woollen goods and cloth exported from England amounted to £26,665, and from this was obtained £2388 : 10 : 11, viz. customs £1523, and subsidy £865 : 10 : 11; gradually the revenue from imports was becoming the more considerable.

The Long Parliament, after declaring in 1640 that "no subsidy, custom, etc., may be imposed upon any merchandise exported or imported without common consent in parliament," proceeded to levy heavy duties on the old lines. The year 1660 marks the beginning of a transition stage. In the Book of Rates for this year, 212 articles were subject to export duty "rated for duty outwards." The duties granted to Charles II. were levied with some modifications in the ninth and tenth years of William III. as the "new subsidy" and continued by 9 & 10 Anne, c. vi. (1710) by the act "for reviving, continuing, and apportioning certain duties upon several commodities to be exported and certain duties on coal, etc., etc." But in 1721 the export duties on corn, woollen fabrics, linen manufactures, and other staples were repealed; the mercantile theory with its mania for exportation had found these duties obstructive. Nevertheless in Saxby's manual of the Customs (dated 1757) some twenty-five pages are occupied with the enumeration of the goods rated for duty outwards, and the directions for paying the proper duties, and in Pitt's consolidating Customs Act of 1787 there are fifty articles subjected to export duty, many of them being of foreign origin. These duties were increased during the great war, and at the beginning of the century, under the act of 1809 (49 Geo. III. c. 98) Sched. A "Outwards," which rated for permanent duty, and in a parallel column for temporary or war duty:—

(*a*) Foreign commodities to the number of sixty-three at varying, chiefly specific duties.

(*b*) British goods, of which coals, skins, and other articles were subject to specific duty; all other goods, wares, etc., to an *ad valorem* duty—excepting cotton, linen, sugar, woollen goods, and certain special exemptions with reference to the port of destination.

By an act of 1810 linen goods were subjected to an *ad valorem* duty of 15 per cent on exports. But with the close of the war and the progress of the new economy the backward policy was reversed. In 1815 the export duties produced £365,598, and in 1826, £102,255. Under Mr. Huskisson, in the latter year, the schedule of articles left subject to export duty was as follows:—

Coals, per chald. 1s. 6d. to 30s. 3d., according to destination, etc.
Culm, per ton, 1s. to 10s., according to destination, etc.
Skins, per 100, 1s.
Wool, per lb., 1d.
Woollen manufacture, per lb., 1d.
All produce of the United Kingdom, except certain articles definitely exempted, *ad valorem*, 10s. per £100, *i.e.* ½ per cent.

and with Peel's reformed tariff of 1842 these disappeared altogether.

One of the few accidental gains to be placed to the credit of the old mercantile theory was that it tended to discourage duties on exportation. Sir W. Petty (1679) shews a consciousness that such duties required careful watching. Sir John Sinclair (1790), who had imbibed the doctrines of Adam Smith, is the first writer apparently who distinctly expresses a doubt as to the propriety of their imposition. Formerly, he writes, almost every commodity sent out of the kingdom was subject to such a duty; it was supposed that the duty came out of the pockets of foreigners, but "such ideas are now exploded." He referred to the principal export duties at that time, under Pitt's recent act, as being those on coals and lead, with certain duties on raw produce intended to give our manufacturers "an advantage over rivals." McCulloch (*Taxation and the Funding System*) has a full discussion of the economic propriety of export duties, and suggests the grounds on which they have generally been condemned. His statement of the arguments for and against the retention of such a duty on coals, published just at the time when that duty was finally removed, is of special interest; it embodies the argument in which economists have for the most part summed up the whole discussion on these duties, viz. that they should not be levied except in the case of a country which has a monopoly of supply of the commodity taxed, or such an advantage in its production as to approximate to a monopoly.

Turning to the British possessions it is natural to find that in those which were acquired during the 17th century, when export duties were an unchallenged feature in the fiscal system of this country, the export duty is, so to speak, bred in the grain; in the colonies established towards the close of the 18th century such a duty practically had no place.

The notorious 4½ per cent *ad valorem* duty which created such squabbles between the crown and the West Indian islands was the progenitor of colonial revenues. At the time of the Restoration, when all the revenues of the crown were being revised, plantation enterprise was at the height of its activity, and it occurred to the crown advisers that the new dominions beyond the seas ought to contribute their share. Thus the origin of colonial customs was precisely the same as that of the English customs. The patent of 1663, constituting the office of commissioners of customs, empowered them to levy and collect a duty of 4½ per cent *ad valorem* on all dead produce exported from Barbados and certain other sugar colonies, and from the plantations in America. In respect of the latter no such duty was ever actually levied. In the West Indies it was the cause of much grumbling; already, in 1689, it was urged that "moreover this four and a half is collected in such manner that in the judgment of all that have

tryed it, the attendance and slavery is a greater burthen than the duty" (*Groans of the Planters*); it was found to be "the same thing in effect as a tax on lands." It was the subject of a great action in 1763 in a case arising on the island of Grenada, Campbell *v.* Hall, where payment of the duty was refused on the ground that the island was ceded by France on the condition that the privileges of the former *régime* should be secured to the inhabitants. This led to the exception of "the Ceded Islands," and Jamaica, from the operation of the duty. It was for many years paid in kind, and in 1778 the right so to pay it was successfully contested (Macpherson's *Annals*, iii. 625). This is not remarkable in an age when sugar was the current money of account. For the better collection of this and other duties the customs department had branch establishments in the colonies, and they continued to levy the 4½ per cent till it was abolished with slavery in 1838.

Of the other colonies the only ones in which duties on exports were levied in the first quarter of this century, were the Mauritius (certain rates on sugar, coffee, cotton, indigo, and one or two other articles), the Cape (on all produce shipped, half the amount of the import duties on similar articles), and Ceylon (on cinnamon, etc.). These were relics from foreign rule in each case, and disappeared gradually under British rule. The export duty on cinnamon from Ceylon had an instructive history, as it was exceedingly profitable when Ceylon had almost a monopoly of that spice, it was a chief element in driving other tropical countries to compete with Ceylon, and was dropped, in 1833, too late to save the colony's pre-eminence in that export.

In India export duties were a relic of the old system: when the imperial government took over the provinces in 1857 there were export duties levied in all the presidencies, and chiefly on grain, rice, indigo, lac, opium, silk, tobacco, and native manufactures of all sorts. An act of 1860 abolished those on manufacture of wool, flax, hemp, jute, etc. At the present day those on rice, opium, and certain other commodities remain. The Indian export duty on rice has been quoted by Fawcett and others as an instance where the duty was probably justified owing to the great advantages possessed by the exporting country in the production of the commodity.

The most striking modern recrudescence of export duties was in connection with the immigration of Indian coolies to the sugar-growing colonies. One of the conditions of government aid in importing coolies was that the planters should pay their fair share; and after much discussion an export duty on sugar and the other produce of the plantations was settled as the best method of obtaining the necessary contributions. Hardly therefore were many of the West Indian colonies freed from the ancient 4½ per cent duty than they undertook a new specific duty on exportation of sugar and other produce. The St. Lucia Schedule was a fair sample, imposing duties on—

Sugar	Charcoal	Hides
Rum	Logwood	Cocoa
Molasses	Firewood	Coffee

From a return given to parliament in 1854 it would appear that then the only British colonies which levied a duty on exports were the West Indian islands of St. Lucia, St. Christopher, Nevis, Montserrat, and the Virgin Islands, and the Mauritius which exacted 9d. the 100 lbs. on sugar. The Turk's Islands imposed a ½d. per bushel on salt. But it was inevitable that a principle admitted in the case of a special service should sometimes extend itself; and in later years there has been an increased tendency to levy export duties in the West Indies; while in New Brunswick, for a time, there were certain export duties on lumber, and in Prince Edward Island in 1861 a special duty was provisionally authorised to be collected for a special purpose on all agricultural produce exported. In the Bahamas so lately as 1870 and 1873 a general export duty on all produce was imposed; but that has now been dispensed with; the Virgin Islands being now the only instance of the survival of general export duties, which are almost entirely evaded, upon all the commodities which nature will allow those islands to produce. Such duties were distinctly condemned by the royal commission which inquired into the finances of various West Indian colonies in 1883-84 (*v.* their report, pt. iv.).

At the present time export duties are levied, usually for purposes of immigration, in many of the West Indian colonies, but not British Guiana. In one or two cases they are levied under a delusive name, *e.g.* "statistical tax," in others they are indirectly increased by wharfage duties for outward goods. In Trinidad, besides the duties on products of the cane, there is an export duty on pitch. In Turk's Islands that on salt remains a chief source of revenue. New South Wales, Western Australia, and Natal levy one on gold. The Fiji Islands, for purposes of regulating the trade, levied one in 1877 on silver coin and sandalwood, and in 1887 on *bêche de mer*. The duties on pitch, gold, and salt are generally looked on as royalties and in the nature rather of a rent than a tax.

The plantations on the mainland of America appear never to have paid an export duty, and the United States maintained the tradition, which also fell in with their policy of encouraging exportation as much as possible. One feature in the recent commercial policy of the United States deserves special mention. In the many treaties or agreements which they have been negotiating with the Central American and other states, they have carefully guarded themselves against the possibility of an export duty

being levied in the contracting state; apparently arguing that the imposition of such a duty is an attempt to raise the price to the United States consumer, and must, therefore, be treated as an unfriendly act to be punished by a countervailing duty.

In foreign countries duties on the exportation of commodities are still prevalent, levied sometimes on the chief product of the country, as on the charcoal and olive oil of Italy, in other cases as protective of home manufactures, as in the case of Swedish iron.

The views which have prevailed as to the incidence of export duties have been indicated in several passages above. The accepted view that the duty operates as a restriction to exportation, except where the exporting country has a monopoly of production, appears to be correct. If all countries levied export duties in exporting the same commodity the price of the commodity would be raised to cover the amount of the duty, and the foreign consumer would eventually pay the duty or the greater part of it. But as the facts are contrary to this hypothesis, it will be found in almost all cases, *e.g.* sugar exported from the West Indies —that the price paid by the foreign consumer is determined by stronger considerations: the exporter cannot control it; the duty falls on him and enhances his expenses in production, or perhaps more accurately it lessens his profits. In any special case the factors which determine price are important in deciding the incidence. The case of monopoly is nowadays hardly of practical importance.

C. A. H.

EXPROPRIATION. Expropriation may be defined as the compulsory sale of private property either to the state or to private parties who have received specific authority from the state.

That such compulsory sale is sometimes indispensable to the public welfare is too obvious to need demonstration. The necessity for expropriation can rarely arise in the case of movable property. Such articles can almost always be obtained by a voluntary transaction, if not from one owner, then from another. The acquisition of a particular movable can hardly ever be matter of necessity to the state. Even a unique picture or statue is a luxury which it is not advisable for the state to acquire at the cost of infringing upon the general freedom of an owner to dispose of his property at his pleasure. In some countries the finder of antiquities is obliged to transfer them to the state on receiving compensation. But this exceptional rule is of no economic importance. With reference to immovable property the case is different. Not only is land necessary as the basis of human industry and limited in extent, but the land suitable for a specific public purpose is often very narrowly limited indeed. In order to lay out a street or a railway, to construct a public building, a fortress, or a harbour, particular pieces of land must be obtained, even although their owners do not desire to part with them. If no compulsion were to be used in such cases the state would be reduced to offer a preposterous price or to forego a necessary improvement.

But expropriation is allowable only in order to effect an appreciable public good. All compulsion is painful, and pain should not be inflicted without a rational object. The presumption is in favour of letting every man do as he likes with his own. Therefore the burden of proof lies upon those who advocate expropriation in any particular instance.

To what extent expropriation should be carried is a wider question than that to which these remarks must be limited. We need not inquire whether the state would be justified in expropriating certain species of property on the ground that it could manage them more advantageously to the whole community than private owners could or would do. Such an inquiry belongs rather to the head of STATE INTERFERENCE (*q.v.*). Nor need we inquire here into the kindred question whether it would be right to expropriate, say, large estates in order to break them up and sell the land in small parcels so as to multiply peasant proprietors. Nor need we determine whether the state would do well to acquire certain species of property on the ground that they tend to increase in value merely through the general progress of society, and that this increase should go to enrich the community rather than individuals (see INCREMENT, THE UNEARNED). It is enough for us that the necessity of expropriation in certain cases is admitted by the great majority of persons who have considered the subject. We have only to consider upon what principles expropriation, when necessary, should be conducted.

In case of expropriation the owner should receive at least the price which he could obtain in the open market, if he were disposed to sell. The market price is the only impartial and trustworthy measure of the value of property. It represents the value of property under all the actual circumstances, including the reasonable expectations to which the laws and policy of the state have given rise. It is unworthy of a civilised government to pursue a certain class

of owners with covert hostility, to burthen them with overwhelming taxes, or to deny them effectual protection, in order to make their property worthless, and then to buy it at so many years' purchase of zero. Yet these expedients are occasionally recommended in our time by persons who profess to have a special sense of political justice. Even in the case where the state interferes to suppress a form of property distinctly condemned by the improved morality of the general public, it still owes compensation to the proprietors affected. When the British parliament compensated the West Indian slave-owners it acted on the sound principle that the state, which for many generations had recognised and maintained the lawfulness of slavery, was *particeps criminis*, and ought to take its share of the loss. But in cases of this kind the right amount of the compensation may be more doubtful than in others.

Where the owner of property expropriated has increased its returns by a violation of the law the case is different. If the owner of a house permits it to be over-crowded with lodgers, he has no right to compensation for the extra rent which he has thus received. If he lessens his outgoings by allowing the house to fall out of repair, the cost of the repairs necessary to make it habitable should be deducted from the compensation paid. If the house is so ruinous that no repair can make it habitable, he is entitled to compensation only for the site and the materials. In other words the market value, which forms the basis of compensation, must be understood as *the market value obtainable without a breach of the law.* It would be monstrous that a man should obtain compensation for relinquishing a profit which is illegal.

Subject to these qualifications, then, the amount of the compensation should not be less than the market value. But it may justifiably be somewhat more. Over and above the loss of his property, he who sells against his will suffers the pain of compulsion, and for this a reasonable allowance should be made. Distinction may be made between objects which have and objects which have not "a value of affection." Thus one acre of arable land differs from another acre of arable land only in its capacity of producing wealth. He who is compelled to sell one field is usually able to buy another field which will do just as well. But the house where a man has lived all his life may be much more to him than any other house of equal value. If compelled to sell it, he cannot buy another which will be the same to him. *Prima facie*, therefore, the indemnity for constraint put upon an owner to sell should be more liberal in this case than in the other. Compensation, however, must be assessed on general rules, and fine gradations of feeling cannot always be taken into account.

Yet another difficulty remains. The owner who is compelled to sell part of his property may have the value of the remainder greatly augmented by the public works for which the land was taken. Whether this prospective improvement should be taken into account in assessing the compensation due to him is a much-disputed question (see BETTERMENT).

The principles of compensation will be the same whether the party taking by compulsion be the national government or a municipal authority or a private joint-stock company or individual. But, when the state confers the power of expropriation upon its subordinates or upon private parties, it is entitled to determine the objects for which this power shall be exercised, the extent to which it shall be exercised, and the service which shall be rendered to the public by those who are invested with it. These, however, are points which must be determined by common sense in each case as it arises. F. C. M.

[See also EMINENT DOMAIN.]

EXTENSIVE CULTIVATION (see INTENSIVE CULTIVATION).

EXTENTS (see COURT ROLLS, MANORIAL ACCOUNTS, and EXTENTS).

EXTRANEUS. A freeman by birth coming into a manor from outside, and so opposed to *nativus*, but holding land on it by villein tenure. He could not, however, be ejected as long as he performed the services due from his holding, and he could surrender the holding at will. Vinogradoff shows (*Villainage in England*, 1891, p. 63), against Britton's theory, that the descendants of an *extraneus* might lapse into villainage in the fifth generation.

[Vinogradoff, pp. 77-82, 142.] E. G. P.

EYTON, ROBERT WILLIAM (1815-1881), was born at Wellington (Salop); graduated from Christ Church, Oxford, in 1839. He is best known as an antiquary, but his works are of value to the economist for the information they contain on the economics of the Middle Ages, and especially on the fiscal systems of the Anglo-Norman kings.

Such of his works are: *Domesday Studies* (Somerset), London, 1881.—*Domesday Studies* (Stafford), London, 1881.—*Key to Domesday*, London, 1878.—*Notes on Domesday*, London, 1880.—*The Staffordshire Pipe Rolls*, vol. i., London, 1880.

INTRODUCTION TO VOLUME II.

THE remarks made by way of introduction to the first volume of this work, both as to the method followed and the general plan, may be usefully continued here.

The work has been carried on upon the lines previously proposed, with the assistance which the experience thus gained has given. The great desire of the Editor has been to assist the student to understand the existing position of economic thought. To do this effectively, the past also has had to be investigated, and the many lessons which it contains brought again before the mind. In this reference attention may particularly be drawn to the article on the Historical School of Economists, and the articles on the French, German, and Italian Schools of Economics, which the present volume contains. It has been encouraging to the Editor to be assured that the histories of the Dutch and the English schools, which appeared in the first volume, have been found of value by other economists, and he sincerely trusts that the histories specified above will also be serviceable in a similar manner.

The better knowledge of economic teaching in other countries, which has extended itself among us of recent years, is, of itself, one proof of the more fruitful attention given to the study. In every branch of science it is always advantageous to know how a subject has been regarded by those who have examined it from other points of view than our own. This is especially the case with such a study as economics. The ruling modes of thought and of training, the very conditions of society, all tend to cause differences in the way of regarding social questions. Familiar instances of this are found in the fiscal arrangements of different countries, the modes of levying taxation, the laws regulating labour, and many other matters. For instance, large sums are raised by methods of taxation in France—*e.g.* the Octroi duties—which would never be borne in this country. Here they would be considered to shackle trade and to oppress the working classes; there they are regarded as an equitable mode of collecting the sums needed for local administration.

Again, there are always some differences of treatment, some differences of surroundings, which colour and shape with their special influences the work of students in other lands. The sketch of the French school shows what progress economic thought had made in France before the end of the 18th century; the improvements in fiscal legislation, which were effected by successive ministers, influenced by the teaching of the *Économistes*, and exemplified by Turgot.

In Germany, the attention given to "cameral science," even in the mediæval period, gave early economic study a different and more practical turn from that followed in any other country of Europe. It will be new to many of our readers

to learn that a Zollverein for the empire was proposed in the Imperial Diet of 1522-23. But the most brilliant period in German economic thought is found in the present century. The influence of the great leaders of the German mind—of Fichte, Hegel, and Kant—was slow to develop itself in economics, but it has leavened all the subsequent literature of the subject.

Of the historical articles the one on the Italian school will probably contain most that is new to English readers. The political subdivision of Italy, carried on for centuries and perpetuated to a comparatively recent period, had its counterpart in the prolific wealth of Italian economic literature. The number of small principalities and independent states with the most dissimilar forms of government—from free-trade Tuscany, the great commercial republics of Venice and Genoa, to the militant mediævalism of Naples, with almost every intermediate form of political association—had the result of enriching Italian economic literature with the works of many writers who had continual opportunities of recording the effect of the different systems pursued.

The works of the writers noticed throughout the volume are widely unlike in character. Some are the labours of practised scholars with a perfect command of the vocabulary they employ, enforcing the broad views which wider experience enables them to express. Others have been the jottings down of hard-working but comparatively uneducated men, full of practical common sense and of shrewd observation, but sometimes exhibiting a deficiency in dialectic skill which prevents them from setting forth the truths they desire to inculcate to fullest advantage. Again, the history of science has often to record periods of abatement in energy, but after a time of quiescence the vigour of a living study invariably revives.

Besides the historical articles and those describing the works of economic writers, the side of pure theory has also received due attention. Thus, to select merely the subject of Method, the volume contains articles on Graphical Method, Historical Method, and Inductive Method, Logic and Political Economy, and Method of Political Economy, Mathematical Method, and many other articles on similar subjects, and the Laws of Political Economy, giving a full explanation of this difficult and often debated expression. Under the heading of Labour Exchange will be found illustrations of the Labour Notes issued by associations under the influence of Owen and Place. This phase of an earlier movement, designed to bring all labour to a parity of value, is now almost forgotten. But in its time it bore an important part among the passing influences on current thought.

I desire again to express my best thanks for many valuable suggestions, much kind help and useful information most liberally supplied. This has been to me a source of constant pleasure and a great advantage to the work; especially I desire to record that this volume has greatly benefited both as to its form and its substance through the special help of Dr. Bonar, Mr. Henry Higgs, Mr. E. Schuster, and Mr. H. R. Tedder. Only the Editor can know the value of this assistance.

Considerable progress has been made with Vol. III.

R. H. INGLIS PALGRAVE.

BELTON, NEAR GREAT YARMOUTH,
Midsummer 1896.

AND truly as we look for greater knowledge of human things and a riper judgment in the old man than in the young, because of his experience and of the number and variety of the things which he has seen and heard and thought of; so in like manner from our age, if it but knew its own strength and chose to essay and exert it, much more might fairly be expected than from the ancient times, inasmuch as it is a more advanced age of the world, and stored and stocked with infinite experiments and observations.—BACON, *Novum Organum* (Ellis and Spedding's edition, 1858), vol. iv. p. 82 (translation).

. . . So far is it from being true, as some would seem to suppose, that economic science has done its work, and thus become obsolete for practical purposes, an object of mere historical curiosity, it belongs, on the contrary, to a class of sciences whose work can never be completed, never at least so long as human beings continue to progress; for the most important portion of the data from which it reasons is human character and human institutions, and everything consequently which affects that character or those institutions must create new problems for economic science.—CAIRNES, *The Character and Logical Method of Political Economy*, 2nd edition, lecture i., introductory, p. 22.

DICTIONARY OF POLITICAL ECONOMY

F'S, THE THREE

Fixity of Tenure, p. 1; Fair Rent, p. 1; Free Sale, p. 2.

The "Three F's" is a cant term to express three things desired by some tenants of agricultural land—fixity of tenure, a fair rent, and freedom of sale of the tenant's interest in the land. The first two are closely connected, for the tenant would derive no benefit from fixity of tenure if the landlord was free to demand whatever rent he pleased; nor would the tenant derive benefit from the ascertaining of a fair rent if he might at any moment receive notice to quit. Fixity of tenure at a fair rent, or, to put the same thing in other words, a fair rent with the assurance that while circumstances continue the same it will not be raised, is the really desirable thing. Nor would this be hard to secure if the tenant always did his duty by the land and the landlord always did his duty by the tenant.

Fixity of Tenure.—It is clear that the cultivator will cease to cultivate unless he has some assurance of reaping the fruits of his labour. But the possible degrees of assurance are many. The cultivator who is not a proprietor must pay for the use of the land and must give up the land when he can pay no longer. Subject to this liability, however, he may be protected from disturbance either by law or by custom. Under Roman law the person who held land in virtue of a contract of Emphyteusis (*q.v.*) was absolutely irremovable so long as he paid his rent and did not commit waste. A lessee for a term of years is protected by English law so long as he fulfils the covenants of his lease. If there is no evidence to the contrary, our courts assume that every contract for the letting of agricultural land is for a year at least, so as to ensure the harvest to the tenant who has sown it. Under the Irish Land Act of 1881 the Irish tenant has fixity of tenure so long as he pays the rent determined either by a judgment of the land court or by an agreement made with his landlord to avoid the necessity of litigation. The Crofters Act of 1887 contains similar provisions for the benefit of a class of agricultural tenants in Scotland. Legal fixity of tenure is also enjoyed by certain classes of cultivators in our Indian empire.

But the same result has frequently been brought about by custom. The mediæval villein was originally a slave cultivating the soil for his lord. But the services due from the villein were gradually fixed by custom, and then the villein acquired fixity of tenure. In England a further step was taken when these services were commuted for money. In the case of the metayers, who form so large a class in several European countries, the share of the produce due to the landlord came to be fixed at one-half or two-thirds of the whole; and subject to this claim of the landlord, the Metayer (*q.v.*) was secured in his holding by custom. Even in modern England the apparent insecurity of tenancies from year to year has been mitigated by the feeling general among all good landlords that a satisfactory tenant should not be displaced merely in order to get a higher rent from a newcomer.

Fair Rent.—Few vaguer terms than "fair rent" can be found in the whole range of economics. Some limitation to the demand for rent is an indispensable condition of fixity of tenure. Such a limitation may be the result either of custom or of law. In those societies where custom has created fixity of tenure, custom has determined the landlord's claim whether for service, for produce, or for a money rent. But the ascertainment of rent by custom has not proceeded from any abstract notion of fairness. Experience has settled how much the cultivator can afford to give, one year with another. But when the rent is to be settled by judicial award, some guiding principle must be sought and is extremely hard to find. If the fair rent be taken to mean the economic rent, the surplus due to the natural advantages of the land, the amount of this surplus in the case of any particular farm, is something which eludes inquiry. But if the landlord or his pre-

decessors in title have expended capital on the improvement of the land, the fair rent must be something different from the economic rent. It must include, over and above the economic rent, an allowance for the return upon the capital invested in the soil in so far as the effects of that investment are not exhausted. The ascertainment of the fair rent would thus involve two additional inquiries, one almost hopeless, viz. how much the landlord and his predecessors in title have expended in improving the land, the other quite hopeless, viz. what additional value the land at this moment possesses as the result of that expenditure. But, if the law neglects these considerations and adopts the principle that a fair rent is that which allows a fair subsistence to the cultivator, new difficulties arise. In the first place, the standard of living differs much in different districts and in different classes. In the second place, it is well known that one man will thrive on the farm on which another man starves. In the third place, it is unlikely that the cultivator to whom a fair subsistence is secured by law will exert himself to produce anything over and above that fair subsistence. He is not likely to labour in order that there may be a surplus for the landlord. He is more likely to reduce his exertions to providing for himself and to trust that the next judicial award will lessen his rent in consequence. Lastly, the holding may be so small that under no circumstances could it support a family. In such a case the tenant will derive much of his income from other sources, and it will be doubly difficult to say how much his holding should contribute to his maintenance. These difficulties may explain the fact that in the Irish Land Act of 1881 and in the Scotch Crofters Act of 1887 no precise instructions were laid down for the guidance of the courts entrusted with the determination of fair rents. The actual process of determination has unquestionably been very summary, and the result is at best a rough compromise between the claims of the landlord and of the tenant. Only urgent necessity can justify the state in undertaking such a hopeless task as the ascertainment of "fair rents." So long as the settlement of rents by competition does not occasion any violent social disturbance, competition should be left to take its course (see FAIR PRICE; FAIR RENTS).

FREE SALE.—Wherever the first and second F's have been accepted, the third F follows as a matter of course. For the tenant who enjoys fixity of tenure at a fair rent has an interest in the land which approaches nearly to ownership, which has an appreciable value in the market, and which he should be allowed to sell whenever he wishes to part with it. It is for the landlord's advantage that the tenant should have this power of sale. For it is a strong incentive to the tenant to labour for the improvement of his holding, and thus to augment the landlord's security. It is only just, however, that the landlord should have the right of objecting upon definite grounds to a person who wishes to purchase the tenant's interest and to take his place. Otherwise the landlord might occasionally be forced to accept a man who would let the holding dilapidate and fall into arrear with his rent. Such cases however are rare. Recent experience in Ireland shows that with fixity of tenure and judicial rents the tenant's interest in the land has become extremely valuable. The man who is willing to pay the high price demanded for the tenant-right is probably anxious to make the most of the farm when he gets it. In conclusion, it may be said that when the principle of the three F's has been fully admitted, the tenant is economically, although not legally, part owner of his holding. Economically, although not legally, there is a divided ownership. In countries which have only attained a low stage of economic development, where all economic relations are settled by custom, and where the mass of mankind have no distinct idea of "getting on," divided ownership of land may continue for many hundreds of years. Divided ownership was a lasting phenomenon in mediæval Europe. It is likely to survive a long time in India. But in modern Europe and especially in the United Kingdom it is not likely to last. The farmer who has secured the three F's will wish to take another step and to become full owner of the land. The landlord who has been obliged to yield the three F's will feel that he retains no more than a rent-charge on his land and a rent-charge of a highly precarious nature. The landlord will be willing to sell and the farmer will be eager to buy. When arrangements for sale are based on mutual agreement they are far more likely to be satisfactory to both parties than when resulting from the influence of legal rules. In the classic country of the three F's, in Ireland, where these have been so long demanded and at last so fully conceded, they are gradually losing their importance as one large estate after another is bought by the tenants. The Land Act 1881 was followed by the Ashbourne Act 1885, the Purchase of Land (Ireland) Acts 1891, and the Irish Land Act 1903.

F. C. M.

FABBRONI, GIOVANNI (1752-1822), born in Florence of noble parentage. He devoted his time to natural science, political economy, and foreign languages, and attained high position under the government of the Grand Duke Leopold of Tuscany. When Tuscany was

annexed to the first empire of France, Fabbroni was appointed deputy in the Paris legislative assembly for Pisa, and baron of the empire. When Napoleon I. fell Fabbroni retired to Tuscany, and became honorary professor at the university of Pisa. He wrote on agriculture, technology, chemistry, physics, and mathematics, and his writings are read with interest to the present day. He was greatly esteemed at home and abroad: Jefferson dedicated to him a house in far Virginia; Cuvier honoured him with an historical eulogium.

A complete catalogue of Fabbroni's works is in his "Life" by Andrew Mustoxidi inserted in the *Biography of Tipaldo* (vol. i. p. 337 *et seq.*). In economics he supported Leopold's liberal reforms, especially free trade in corn, which he discussed in different polemical writings, and with more energy in his *Dei provvedimenti annonari* (1804, 2nd ed., 1817); here he examines and refutes the various systems of restricting commerce in corn, and concludes in favour of full liberty. In his treatise *Della prosperità nazionale, dell' equilibrio del commercio e dell' istituzione delle dogane* (1789), published under the name of VALENTINO FORONDA, he opposes custom-houses as they "are contrary to the principle of fraternity which ought to be the ensign of all nations," and violate the rights of property and liberty. No foreign commerce ought to be feared, because "it requires fourfold the advantages of our nation to cover the risks and commission, carriage, and the like." Thus, in his treatise *Dei premi d'incoraggiamento che si retribuiscono alle mercature, dei privilegi esclusivi che si accordano alle manifatture, e della libertà che si concede al commercio dei grani*, he opposes any interference with the natural development of commerce. In another treatise, he opposed (1791) the retrograde views of the *Sentimento imparziale per la Toscana*, by Biffi Tolomei. Fabbroni supports the theory of free-trade, gathering together all the arguments of contemporary writers: he sets out the respect due to property and liberty, describing the natural conditions through which national industries succeed in home markets; the advantage accruing to all classes from the increase of rent of land, which causes a demand for manufactures—an idea derived from the physiocratic doctrine as to the products of land,—which doctrine Fabbroni, however, does not accept in its entirety.

FACE VALUE, or nominal value, is the value mentioned on the face of a security as distinguished from the market value. The face value of securities passing by delivery determines the amount of the government stamp, and generally also of the broker's commission. Thus the stamp duty on £1000 Egyptian state domain bonds is the same as on £1000 Honduras bonds, though the market value of the former is (1893) about £1030, while the market value of the latter is only about £75. The face value generally represents the amount at which the security is repayable or redeemable, but this is not always the case. There are some debentures which are repayable at a higher amount than the amount represented by the face value, and instances also occur of securities being redeemable at a discount. E. S.

FACTOR (Scots law). A paid commercial agent, remunerated by commission, entrusted with the possession, apparent ownership, management, and disposal of the employer's property and the management of all the principal's affairs in the place where he resides, or in a particular department. He is in point of law a person distinct from his principal. Factorship or "factory," is express or implied, special (*i.e.* limited to a particular department), or general, or both special and general, his commission in the last case conferring on him both general powers and special powers, which would not otherwise have been included. He must act personally, as a rule; he must remit, according to the principal's directions, all money received by him in the course of the factory business. The employer is bound by all engagements contracted by the factor within his powers; by the common law of Scotland, which in this respect differs from that of England, as well as by the FACTORS ACTS (*q.v.*) he can pledge the goods of his principal; and the risk of goods in the factor's hand is, as a rule, with the employer. Third parties deal with the factor as with a principal, unless he expressly deals as a factor for a disclosed principal, not one resident abroad. Factory endures, unless recalled, or terminated in terms of the commission, or superseded, during the life of the employer, and thereafter for unfinished transactions or those entered into in ignorance of the death of the principal.

[See Bell's *Commentaries*, i. 506. Also a steward, a law-agent who manages the letting of farms and other landed estate business. See also JUDICIAL FACTOR.] A. D.

FACTOR (English law). See FACTORS' ACTS.

FACTORIES. The East India Company early established stations in the east for their trade with Persia, Japan, and especially India and the Islands. The first was built at Acheen, in Sumatra, 1602, and within forty years was followed by factories at Bantam, Surat, Agra, Banda, Masulipatam, Jaccatra (Batavia), Scinde, Hooghly, and many other places. Some, *e.g.* Fort St. George (Madras) and Surat, were fortified. These factories were houses containing resident traders—merchants, factors, and writers—the foreign agents of English traders, whether of individual "interlopers" or of a company. These gave their employers much trouble by private trading, perhaps because of their low salaries. Factors received only £20 yearly. Against factories are urged their expensiveness, the patronage enjoyed by the directors, the collisions they occasioned with the Portuguese and Dutch merchants, who feared

competition; for them it is argued that they systematised, extended, and gave continuity to the company's trade, that merchants without permanent stations and forts could not have resisted Dutch opposition (Mill's *British India*, 1840, vol. i. p. 105-106 and note). The success of the system seems to justify it. The factories became governmental centres and led to territorial acquisitions.

FACTORS' ACTS. The Factors' Act 1889 (52 & 53 Vict. c. 45), which consolidates and repeals the previous acts dealing with similar subject matter, is a partial application to English law of the celebrated French maxim, "En fait de meubles possession vaut titre." The present act is the outcome of a long struggle between the mercantile community on the one hand and the principles of common law on the other. The general rule of the common law as of the civil law was *Nemo dat quod non habet*, and it was held that the mere fact that a person was in possession of goods, or documents of title to goods, did not enable him to bind his principal by disposing of the goods or documents in contravention of his instructions with respect to them. The merchants and bankers contended that, in the interests of commerce, if a person was put or left in possession of goods or documents of title, he ought, as regards innocent third parties dealing with him in the ordinary course of business, to be treated as the owner of the goods. The object mainly contemplated by legal rules is to guard against fraud, the object mainly contemplated by mercantile usages is to guard against the risks of insolvency. The legislature has effected a compromise between the legal and mercantile contentions, but in doing so has in each enactment given more and more weight to the mercantile opinion. The first Factors' Act was passed in 1823 (4 Geo. IV. c. 83), the second in 1825 (6 Geo. IV. c. 94), and the third in 1842 (5 & 6 Vict. c. 39). The object of these three acts was to validate sales and pledges made by factors and other mercantile agents of the same class who were entrusted by their principals with either goods or the documents of title to goods. The Factors' Act 1877 (40 & 41 Vict. c. 39) made a new departure by putting the seller who was left in possession of the documents of title, and the buyer who obtained the documents without paying the price, on the same footing as factors.

The present act, after defining the terms "mercantile agent," and "document of title to goods," enacts that when a mercantile agent is with the consent of the owner in possession of goods or documents, any sale pledge or other disposition made by him in the ordinary course of business shall be as effectual as if it were authorised by the owner of the goods, provided that the person with whom he deals has no notice of the agent's want of authority (§ 2). If, however, the goods are pledged for an antecedent debt or liability, the pledgee acquires no better title than the pledger had at the time of the pledge (§ 4). Protection is then given to *bona-fide* exchanges of goods or documents, and to the lien of consignees, when the consignor is not the owner of the goods (§§ 5 and 7). Some important alterations in the law of sale are next effected. Henceforth if the seller is left in possession either of the goods themselves or of the documents of title to them, any sale or pledge by him to a transferee in good faith and without notice binds the original buyer, and in like manner, if the buyer of goods obtains possession either of the goods or documents without having paid for them, any sub-sale or pledge by him binds the original seller (§§ 8 and 9). Finally when any document of title is lawfully transferred to a holder for value, the seller's lien or right of stoppage is defeated to the same extent as it would be defeated by the transfer of a bill of lading which by common law is treated as a quasi-negotiable instrument (§ 10).

The misappropriation of goods or documents by factors or other agents is made penal by §§ 77-79 of the 24 & 25 Vict. c. 96. The Factors' Act 1889 applies to England and Ireland, and operates on transactions subsequent to the 1st January 1890. Its provisions are now applied to Scotland by the Factors (Scotland) Act 1890. M. D. C.

FACTORY ACTS. Under this general title is commonly included the whole of that very exceptional code of laws for the regulation of labour in this country, which, springing up about the beginning of the present century, and gradually extending, now covers almost the whole area of industrial production. The title is, however, no longer either logically or even conventionally accurate. For, firstly, the designation "factory" is applied by statute in a manner constantly varying and often inconsistent; and secondly, under that general designation are popularly included other establishments engaged in production, as workshops, which are not technically factories.

England is the original home of factory legislation. Previous to the first Factory Act (1802) no precisely similar enactments are known to have existed in any country. Statutes in restraint of slave labour there had been, both in ancient and modern times, and in constraint of free labour: as *e.g.* the celebrated Statute of Apprentices (5 Eliz. c. 4), of which Prof. Jevons says, in *The State in Relation to Labour*, p. 35 (1882), "The hours of labour were prescribed, not, as in our factory acts, by way of limitation, but by imposition"; but up to that time the regulation of voluntary work had been chiefly undertaken, where it was undertaken at

all, by associations of the nature of the Roman colleges (*Collegia Opificum*) and mediæval gilds, either with or without the direct cognisance of the State. About the end of the last century, however, the GILDS (*q.v.*) having fallen into decay, and the pressure of competitive industry having been enormously increased by the introduction of new methods of industry and the great extension of British trade, public attention began to be drawn to the hardships endured by workers in factories, and some supervision of them was demanded. At first this attention was concentrated on the new type of factories exclusively, and principally on juvenile labour employed there. (On juvenile employment, see CHILDREN'S LABOUR.) The first Factory Act (42 Geo. III. c. 73), was further restricted in application by being mainly confined to apprenticed, pauper, labour, and absolutely confined to cotton and woollen mills. It was amended from time to time by subsequent ones, 59 Geo. III. c. 66; 60 Geo. III. c. 5; 6 Geo. IV. c. 63; 10 Geo. IV. c. 51; 10 Geo. IV. c. 63, all of which were repealed, however, by 1 & 2 Will. IV. c. 39; which was itself repealed by 3 & 4 Will. IV. c. 103. In this last act a notable advance was made in the principle of factory legislation. It no longer applied exclusively to cotton and woollen mills, but to "any cotton, woollen, worsted, hemp, flax, tow, linen, or silk mill or factory, wherein steam or water or any other mechanical power is, or shall be, used to propel or work the machinery," . . . and it included within its operation, not only apprentices, but all children up to the age of thirteen years and over eight, and others (in subsequent acts denominated "young persons") between the ages of thirteen and eighteen, for all of whom special hours of work were enacted, and, in particular, night work prohibited. This important act was amended and much improved by 7 & 8 Vict. c. 15; and these two statutes constitute together the foundation of the laws at present in force, not alone for the special classes of factories to which they had then exclusive reference, but for all others. By the last-named an elaborate set of regulations was provided for the conduct of factories (still confined to "textile" factories), and female operatives above the age of eighteen years (thereafter called "women") were for the first time put upon the same footing as "young persons." A department of factory inspection was constituted, having a central office in London; and the well-being of the workpeople was aimed at by many minute regulations and in many thoughtful ways.

With the enactment of this statute (1844) the first stage in the progress of English factory legislation may be said to have been accomplished; that stage, namely, which brought the textile industries under some sort of efficient control. For the next twenty years the energy of factory reformers was principally expended in securing the advantages thus gained and perfecting the system of inspection now fully introduced. To this season belongs, too, the successful conclusion of the long controversy of the Ten Hours' Bill. The demand for a day's work of ten hours, or sixty a week, began as early as before the passing of the act of 1833, which fixed them at forty-eight per week or nine per day, for children from nine to thirteen, and at twelve per day or sixty-nine per week for "young persons" from thirteen to eighteen. By the Factory Act of 1844 these hours were altered to six and a half per day for children between eight and thirteen (not nine and thirteen as formerly), and twelve per day and nine on Saturday for young persons and women (now first included). The object of the agitators was to reduce this number by five hours per week. Such a consummation was apparently achieved by the enactment of 10 Vict. c. 29, fixing them at fifty-eight per week, which, with the shorter time on Saturday, was the equivalent of ten hours' work per day. But in this statute there was a fatal defect. It was not exactly provided when the hard-won ten hours were to be taken—between the extreme limits of 5.30 A.M. and 8.30 P.M.—so that opportunities were offered for evasion, which were only too freely embraced. The remedy was supplied by the Factory Act of 1850, 13 & 14 Vict. c. 54, which definitely introduced the normal working day of twelve hours; six to six, or seven to seven, with one and a half out for meals; thus slightly increasing the full number of working hours per week by two, whilst securing that these should not be exceeded. A subsequent Factory Act (1874) made ample compensation to operatives for any disappointment experienced in this result by reducing the hours in textile factories to fifty-six and a half a week, at which they still remain. During this period (from 1844 to 1864) several valuable new measures were added also to the statute book, some of an amending kind, others distinctly widening the scope of legislation. The first of these was the Print Works Act (8 & 9 Vict. c. 29), applying the principles of the factory acts to print works, as therein defined. This was a very ill-conceived and ill-drawn statute, which was afterwards repealed, and those works were brought under the provisions of 33 & 34 Vict. c. 62. In 1853 and 1856 again further acts relating to factories were passed: the first for the purpose of clearing up some debatable points connected with employment; the latter relating to the fencing of machinery: and in 1860 was passed "An Act to place the employment of women, young persons, and children in bleaching works and dyeing works under the regulation of the Factories Acts" (23 & 24 Vict. c. 78), followed by three amending acts, since repealed, and by the Lace Works Act (24 & 25 Vict. c. 117). But in the meanwhile

the same impulse which had produced these laws had been active also in other directions, and had produced substantial results. As early as 1788 some protection had been afforded to chimney-sweeping boys, and this was extended by other legislation in 1834 and 1840 respectively. In the same year (1840) was issued the first of the great Commissions on the employments of the people, popularly known as the Children's Employment Commissions, one of whose earliest results was the passing of a Mines Act (5 & 6 Vict. c. 99), enlarged and improved (1860) by a subsequent act (23 & 24 Vict. c. 151). Three years later (1863) bakeries were brought under a much-needed supervision by the Bakehouse Act (26 & 27 Vict. c. 40); and in 1864 a whole batch of other industries followed, whose inclusion commences a fresh chapter in the history of English factory legislation.

The Factory Act of 1864, which followed on an early report of the second great Commission of inquiry into the occupations of the people, introduced some startling innovations. Hitherto it had been held, either directly or by inference, that the proper arena of factory legislation was specially the textile industries, or, at most, these and a few others closely related to them; and it had been assumed at all events as a matter of course that *manufacture* was their peculiar sphere. In this view the Print Works Act, and the Bleaching and Dyeing, and Lace Works Acts, had been regarded rather as affiliated than belonging to the Factory Acts, as the Bakehouse Act is to this day. From the Factory Act of 1864 must be dated an entirely new conception of that sphere and this arena. This Act (27 & 28 Vict. c. 48) brought under inspection, not merely several new manufactures in no way connected with textile industry, but certain *employments* as well; and this it did no longer by affiliation, but distinctly by inclusion, thereby formally abandoning the earlier presumptions of what constituted a factory and the proper subjects of factory legislation. The included manufactures were: (*a*) the manufacture of earthenware, "except bricks and tiles not being ornamental tiles"; (*b*) the manufacture of lucifer matches; (*c*) the manufacture of percussion caps; (*d*) the manufacture of cartridges. The *employments* were: (*e*) the "employment" of paper staining; (*f*) the "employment" of fustian cutting. It is clear that the statutory conception of the term factory had hereby undergone a great transformation, and clear also that the present could but be regarded as an instalment of more and larger changes of a like kind to follow. These industries, some of them at least, were not new, the first being possibly the oldest manufacture in the world; nor were they all carried on by novel methods, whether of greatly congregated labour or by means of labour-saving machinery. The operation of fustian cutting, for instance, was a purely manual occupation, largely pursued in the work-people's own houses; it formed in fact a typical "home industry." Nor was the above presumption falsified by the event. Three years afterwards (1867) the Factory Acts Extension Act (30 & 31 Vict. c. 103), passed the legislature, whereby a still greater number and variety of fresh industries were brought in. Under the comprehensive terms of this statute the designation "factory" obtained a very wide significance indeed. First, it included all previous definitions not specially mentioned in the act; and next some thirty new and specially-mentioned ones. But it included also "*any premises* whether adjoining or separate, in the same occupation, situate in the same city, town, parish, or place, and constituting one trade establishment in or within the precincts of which fifty or more persons are employed in any manufacturing process," this last expression being further defined to mean "any manual labour exercised by way of trade or for purposes of gain, in or incidental to the making any article, or in, or incidental to, the altering, repairing, finishing, or otherwise adapting for sale any article"—than which it would be difficult to devise more inclusive terms. To all appearance it only remained now to legislate for the places where under fifty persons were employed in manual labour to cover the whole field of industrial production. This task was undertaken accordingly, within the same year, by the Workshop Regulation Act (30 & 31 Vict. c. 106), the preamble distinctly stating this to be its object. A set of similar, not the same, provisions were enacted for workshops as for factories, and the new term defined. "Workshop" meant any place, not a factory or bakehouse, where any handicraft was carried on, *in which any child, young person, or woman was employed* and "to which or over which the employer of the persons working therein has the right of access or control"; so that workshops employing only adult men were, unlike factories, exempt, and places to which work was taken home to be done were likewise unregulated. With the enactment of these two statutes factory legislation in England theoretically reached the highest point of efficiency that it has yet touched.

But in practice this efficiency was not so apparent. The administration of the Workshop Act had been confided to local authorities, and these almost universally refused or failed to put the law in operation. After three years of unsuccessful trial it was handed over to the inspectors of factories, and seven years afterwards (1878) the two acts were incorporated under the title "Factory and Workshop Act" (41 Vict. c. 16). Unfortunately, whilst so incorporated, the purely artificial distinctions between factories and workshops were retained, whence arises much of the confusion which still encumbers the treatment of this subject, and constantly thwarts the best endeavours of legis-

lators to remove. Repeated inquiries, by parliamentary committees and otherwise, have but succeeded hitherto in making those inconsistencies more apparent, and the remedies applied of demonstrating the impossibility of fixing a complicated mass of legal regulations on a sound basis by means so empiric as those adopted. The act of 1878 deals with five classes of works:—Textile factories, non-textile factories, workshops, workshops in which neither children nor young persons are employed, domestic workshops. By its definitions a "factory" is a place in which machinery is moved by the aid of steam, water, or other mechanical power, and factories are divided into two classes, textile factories and non-textile factories; the words textile factories and non-textile factories being now first used in an act of parliament. The definition of a textile factory remains the same as under former acts, and the regulations affecting them continue the same, as to hours of work and meals, education of children, limewashing, holidays, etc. The term "non-textile factory" applies to the occupations enumerated in the acts of 1864 and 1867 respectively, whether having mechanical power or not, and includes in addition all unnamed occupations in which such power is used. This definition releases from the special factory regulations all those occupations which were factories under the Factory Act 1867 by reason of fifty persons being employed, and in which mechanical power is not used, which therefore become workshops. The works which are specially named as non-textile factories under the act of 1867 are:—Blast furnaces, copper mills, iron mills, foundries. The manufacture of machinery, of any article of metal, or of india-rubber or gutta-percha, by the aid of mechanical power. Paper manufacture, glass manufacture, tobacco manufacture, letterpress printing, bookbinding. All unnamed occupations in which power is not used, except those specially named in the acts of 1864 and 1867, are workshops as above. In these the hours of work and meals, the sanitary condition, and education, are as strictly provided for as in factories, but unless circumstances satisfy the secretary of state that they are required, registers, and certificates of fitness for young persons and children, obligatory in factories, will not be compulsory. The next class of works, to which fewer regulations apply, are the workshops in which none but women above the age of eighteen are employed. In these workshops the actual time of work and of meals must be the same as in non-textile factories, but with more elasticity of arrangement, and the sanitary condition is to be cared for by the sanitary authority. The last class of works is designated "domestic workshops." These exist where work is carried on in a private house, room, or place, in which the only persons employed are members of the same family dwelling there. In them the actual hours of work and meals for children and young persons must be the same as in non-textile factories, but with more elasticity of arrangement; the education of children is on the same plan, and the sanitary condition is cared for by the medical officer of health. The employment of women in domestic workshops is unrestricted. But the act exempts even from such regulations as apply to domestic workshops, and leaves altogether free from this act certain occupations of a light character when carried on in a dwelling-house by the family dwelling there, viz.:—Strawplait making, pillow-lace making, glove making, or others of a like nature to which a secretary of state may extend the exemption. It also exempts from the regulations as to hours of labour and meals, flax scutch mills in which women only are employed intermittently, and for not more than six months in the year. It also exempts any handicraft which is exercised in a dwelling-house by the family dwelling there, at irregular intervals, and does not furnish the whole or principal means of living to the family. Quarries are brought under inspection by this act, either as factories or workshops; and *pit banks*, that is, all parts of a metalliferous mine not subject to the provisions of the Metalliferous Mines' Act.

Since this act has been in operation another important Factory Act (54 & 55 Vict. c. 75) has been passed (1891), in addition to several minor ones. In the act of 1891 some disposition is shown to return to the method of inspection under the Workshop Act, which placed the administration of the law in the hands of local authorities. In both of them a decided retrogression is shown from the strong position occupied by the dual acts of 1867. This is principally apparent in the multiplication of different classes of protected places and the multiplication of authorities having legal cognisance of them. In the meanwhile several cognate acts have also found a place in our statute book; dealing with shop labour, with the injection of steam in cotton factories, the abuses of the Truck system, the protection of children employed in theatres, with bakehouses, white-lead works, etc.; most or all of which are conventionally understood as being included under the general designation factories, and are either wholly or in part under the jurisdiction of the inspectors. Nor has this tendency to spread the utility of factory legislation by the fiction of conceiving of almost any and every occupation as carried on in a factory, reached its probable limit yet, and it is not easy to predict at what point it will do so. The continuous success that has hitherto waited on all these experiments is a strong practical argument in their favour, and the inconveniences which have resulted are not so distinctly of the kind

that enlists general sympathy as to call for any very strong protest against them. Only it should surely not be beyond the bounds of legislative capacity to retain what is good in the present arrangement while eliminating what is faulty, —to secure that a reasonable and consistent technology should replace the present unreasonable one, and a real, not nominal, harmony pervade the whole body of law.

The history of factory legislation abroad is to a large extent but a repetition of the story that has now been told. In other countries, as in England, the pressure of competition, and the novel circumstances brought about by greatly subdivided labour and the increasing use of machinery, have necessitated some counter impulse to neutralise the worst evils which have everywhere been found to accompany the advantages of this great industrial change. In other countries, too, the counter impulse has been usually supplied from the central power of the state. As was also natural the example of this country has been, in a great number of instances, closely followed at first, England being the country that not only had earliest made trial of the new experiment of the factory system itself, but on its greatest scale. Thus foreign factory acts have followed pretty closely the lines of English ones, commencing with partial legislation for only textile fabrics, and proceeding afterwards to other industries. But this rule is not universal. In some countries where remedial measures were late in being adopted, the course pursued has been of a more logical kind, and our more palpable errors have been avoided. Partly on account, no doubt, of the useful object-lesson which they provided; partly, also, from a greater freedom from that tyranny of precedent and mere words, which is so marked a national characteristic here, they have in many cases kept themselves much clearer of inconsistencies and contradictions.

Prussia was the first country of Europe to adopt the principle of the English factory acts, in a law dated the 9th of March 1839, imposing certain restrictions on the employment of young persons and children in textile manufacture. Other states of Germany followed intermittently: Bavaria in 1840, Saxony not till 1861, the North German Confederation in 1869. There is now a general law of a comprehensive kind, embracing the whole German empire. France was but little behind Prussia. The first factory act was enacted there in 1841. Sweden was comparatively early in the field (1846); Norway much later (1860). Austria promulgated her first factory act in 1859; but Hungary not till 1872. Only quite recently have Belgium and Holland moved in the matter, but much has been done of late by these countries to make up for lost time. In Switzerland a few cantons led the way in 1862; others have followed since; and factory legislation is now general. Neither in Italy nor Spain has much been accomplished, but Portugal since 1888 has entered heartily on the path of regulation. In Russia there has been a factory act in force since 1881. The United States of America have no general system, but different states provide for their requirements by different laws, while a few are still without any. In India there is a factory act, but a very inefficient one from our point of view. In the civilised parts of Australia one of a very comprehensive kind is in operation, and an extremely stringent one has been in force in New Zealand since 1873.

FACTORY LAWS IN THE UNITED STATES. The regulation of factory labour in the United States is not a subject of federal, but of state legislation. Consequently there is no uniformity in laws of this character. Some states have progressed much farther than the rest, and are much more active in the execution of the laws. Massachusetts on the whole has taken the lead, while New York, Ohio, New Jersey, and Pennsylvania have advanced in the same direction. In Massachusetts the first law regulating the hours of labour was passed in 1874, making ten hours a legal day for women and children. This was followed by the act of 1877, which provided for the guarding of belting, shafting, gearing, etc., in factories. Members of the state police are detailed to act as inspectors. The act of 1886 provides for weekly payment to operatives employed by corporations. By other legislations night labour is forbidden for women and children, and the time of meal hours is governed. There are numerous other provisions, similar, however, in most respects to factory legislation in England. In 1892 a further reduction of hours, to 58 per week, was made. As yet no attempt has been made in any American state to regulate the hours of male adults. In a few of the states women are employed as inspectors. The labour laws of Massachusetts may be found in the *Annual Report of the Bureau of Labour of Massachusetts* for 1890. D. R. D.

FACTORY SYSTEM. "The term Factory System designates in technology," says Dr. Ure (*Philosophy of Manufactures*, pp. 13, 14), "the combined operation of many orders of workpeople, adult and young, in tending with assiduous skill a series of productive machines continuously impelled by a central power." It includes, he continues, "such organisations as cotton, flax, silk, and wool mills, and also certain engineering works," but it excludes "those in which the mechanisms do not form a connective series, and are not dependent on one prime mover," . . . such as "iron-works, dye-works, soap-works, brass foundries, etc." "Some authors indeed," says Dr. Ure, "have comprehended under the title factory all extensive establishments wherein a number of people co-operate towards a common purpose of art, and would therefore rank breweries, distilleries, as well as the workshops of carpenters, turners, coopers, etc., under the factory system. But I conceive that this title in its strictest sense involves the idea of a vast automaton, composed of various mechanical and intellectual organs, acting in uninterrupted concert, for the production of a common object, all of them being subordinated to a self-regulated moving force." "If," he concludes, "the marshalling of human beings in systematic order for any technical enterprise were allowed to constitute a factory, this term might embrace every department of civil and military engineering—a latitude of application quite inadmissible." It has been shown already (see FACTORY ACTS) that many of the work-places enumerated by Dr. Ure as "quite inadmissible," have, nevertheless, been since included in the statutory term "factory," and many others under the cognate term "workshop." Moreover his definition is inconsistent with itself, and too recondite for ordinary use. "An automaton composed of various mechanical and intellectual organs, acting in uninterrupted concert," is a definition of the factory system which, even if technically correct, would be of little practical use. A more recent writer, Hon. Carroll D. Wright, special agent of the U. S. government, who some years ago conducted an elaborate investigation into the origin and working of the factory system in America and this country, approaches much nearer a proper conception of the subject (*Report on the Factory System of the United States*, Washington, 1884). "A factory is an establishment where several workmen are collected for the purpose of obtaining greater and cheaper conveniences for labour than they could procure individually at their homes, for producing results by their combined efforts which they could not accomplish separately and for preventing the loss occasioned by carrying articles from place to place during the several processes necessary to complete their manufacture. The principle of a factory is that each labourer, working separately, is controlled by some associating principle which directs his producing powers to effect a common result, which it is the object of all collectively to obtain."

The factory system is therefore a system of production carried on in establishments such as these, and a factory must be defined to be an *establishment*, as laid down by Mr. Wright; not a series of productive operations, which appeared to be the idea of Dr. Ure. It is a concrete fact, a *place* of definite and assured bounds. In such places, then, a mode of industry is carried on that differs, and differs even greatly, from what is carried on in other places. Now wherein does that difference consist? Not exclusively in those facilities of manufacture; some of which Mr. Wright has pointed out; certainly not—economically considered—in the circumstance of a greater or less quantity of machinery being used there, or no machinery at all, nor because of any manner of setting or not setting such machinery in motion (which is the distinction of the current Factory Acts). The difference in the social relation resides in the part allotted to labour under it, and in the purely economical relation in the amount, not the nature, of the product. Under a system of manufacture not so carried on the labourer is master of the industry; he is the prime mover in the enterprise; the active centre of the productive act. In manufacture carried on by factory methods he is this no longer. Where machinery is employed, his duty is principally to keep that going, to feed it, clean it, connect it with some exterior motor, and remove the manufactured commodity from it; or where machinery is not employed, he replaces it. He is then but a portion of the producing organism; whose component subdivisions are partly animate and partly inanimate, and whose initiative is supplied from outside; and in this case he is but an adjunct in the general result. He must go altogether with that method of production or withdraw altogether from it; he cannot choose his time or place of work within it, or choose or venture anything. Such is the position of the labourer towards the system; his attitude towards the product has undergone a great change too. Formerly this relation was intimate. He had actually made it, or part of it; an appreciable quantity of his own personality, of his "labour force," had passed into it; it was *of*, even if not *belonging* to him. It is both of and belonging to the system now. A similar transformation marks his position towards the producer. This also under the smaller system of production was intimate, and is so no longer; the great combinations of labour characteristic of the new method, and the great capitals requisite in manœuvring them, rendering each individual human instrument of comparatively

small account. The organism is the supreme object of concern, and hence the relation of the worker to the producer tends to be as remote and impersonal as his relation to the system and the product.

But although machinery, automatic or otherwise, is no necessary feature of the factory system, it was, undoubtedly, the great spread of mechanical invention, and its application to purposes of industry, that fostered its modern growth; just as it was, undoubtedly, the application of the motive power of steam which conferred upon it its most characteristic new form. That the already existent factory system would have continued to spread had these events not occurred is practically certain in view of the industrial history of the time, but no less certain that it would not have spread so rapidly and so much; and it is a natural subject of interest, therefore, at this stage of development —when it begins already to show some signs of entering on a new phase—to inquire what are the most conspicuous economic results that have proceeded from it thus far. The most conspicuous of all results is the immensely increased production of which it has been the instrument; but this is one so patent, and which has been so often the theme of eulogy, that it does not seem necessary to descant upon it here. It will be more to the purpose in such an undertaking as the present to consider to what extent the human agents of production have been affected, and through them the economic position and prospects of the community at large.

It may be said at once, then, that many dismal prophecies which accompanied the unusual development of modern factory labour during its initial period have not been hitherto fulfilled. The factory population has not become less moral during that period, but more moral; not less religious, but more religious. The criminal statistics of factory districts may be appealed to with confidence on the first head; and on the second we have the conclusive evidence accumulated by Sir Edward BAINES (*q.v.*) in a remarkable pamphlet published in 1843, called *The Social, Educational, and Religious State of the Manufacturing Districts, with Statistical Returns* (Simpkin and Marshall), wherein it is shown that in the four typical manufacturing counties of Lancashire, Yorkshire, Cheshire, and Derbyshire, the proportion of sittings in church and chapel to the population was much greater than in—for instance—London, and the proportionate advance in the provision of new sittings during the typical factory period 1801 to 1841 far more rapid. It has not become less intellectual but more intellectual. For, first, the Factory Acts and Elementary Education Acts have secured better instruction; and, next, it is clear from the quantity and quality of literature circulating in factory districts that opportunities of intellectual culture are more appreciated now than formerly. Moreover, it was actually owing to the opportunities afforded by the factory system that the first trial of compulsory education was made in this country through the preliminary medium of the half-time system. Its effect on public sanitation has been good. The large spaces and highly-organised conditions required for the successful prosecution of factory labour might, in any case, have been expected to secure this, and it is further provided for by statute. A physical deterioration has been assumed among the operative population, but this remains to be proved. It is an assertion easily made and readily believed; but is in direct opposition to the opinion of some of the most acute and unprejudiced observers, like Mr. Carroll Wright, and M. Louis Reybaud, the well-known French statistician, who have minutely investigated the facts. Or, if that deterioration be allowed in the case of male operatives compared with the race of domestic manufacturers whom they superseded, the same should not be lightly assumed to apply to women. No one familiar with the textile industries of the north of England can have failed to notice the robust type of women employed there, presenting an especially striking contrast with the equivalent class among sempstresses, domestic servants, or the female population of agricultural districts. Mr. Wright declares the women factory workers in France and Germany to be far superior in physique to those who are employed in workshops, and holds the same to be true both of America and England. Neither, it appears, is it the case that the children of these women are degenerate when compared with the children of others at work at other occupations, or compared with children of wholly unemployed mothers (of the same class), or that infant mortality is higher in factory districts than elsewhere. Mr. Cooke-Taylor has even gone the length of arguing that the opposite is true (see *Transactions of the National Association for the Promotion of Social Science*, 1874 and 1882; *Fortnightly Review*, May 1875; *Contemporary Review*, September 1882; *Modern Factory System*, pp. 408, 423), and has produced a long array of statistics in support of the contention. As for the further question—more social than economic—of the degree in which family life has been affected by the factory system; that is again of wider import than appears at first sight. It is allowed that the arena of productive labour, especially in the greater industries, has been largely transferred from the home to the factory; but is that necessarily an evil? Is it not even what some of our philanthropists are crying out loudly for at the present time? It is true, too, that the factory system fosters independence of character among the young, and has a tendency to break down the old organisation of the domestic circle.

But independence of character may be a gain, not a loss, when not pushed to illegitimate excess; and all modern experience is in favour of limiting the power of parents over their offspring. We have probably not yet seen all that the factory system portends in this connection, just as we have not yet seen the ultimate lineaments of that system itself; the present is a time of rapid transition in labour relations, and it may be well to wait for further readjustments before pronouncing hastily on this and some kindred points.

Some of the more apparent results may, nevertheless, be indicated. How has the factory system affected the relations between capital and labour; and what is its attitude towards the consumer? We have noticed its effect on the relations between employer and employed: it has diminished the intimacy that formerly subsisted between these partners in production. It is much to be feared that its action in the mass has followed the same course as its action in individual instances. It is alleged that capital has not become more, but less, careful of the interests of labour, that labour is not more, but less, careful of the interests of capital; and that even in disputes between the two the aim of each side is sometimes openly proclaimed to be the ruin of the other; what is more apparent, in almost every dispute, is the utter indifference of both to the welfare of the consumer. This was not so always. The gilds and mediæval trade societies, whether of masters or men or both combined, were as careful to make rules against bad workmanship as against bad workers or harsh masters; they were not formally constituted on a purely selfish basis. These are not exclusively the results of the factory system; they are determined by the fierce competition that rages throughout all modern industry; but it must be said of it, at least, that it has never done anything of its own instance to moderate this struggle, while much in its methods inevitably tends to aggravate it.

There is one result, though but an indirect one, which must be set unequivocally to the credit of the modern factory system, and which will remain long after the present form of it has passed into that oblivion which is likely to be its final home. It was the originator of the Factory Acts. By concentrating the evils of competitive industry, it drew public attention to the cruelties of which that vast influence for good was capable, and caused to be set in motion a body of laws of exceptional humanity, whose purpose is to counteract them. The political economy of the future has no worthier task before it than the harmonising those laws with its own principles, the defining their proper sphere of influence, and the guiding their free extension towards just and legitimate ends.

FACTS. In political economy all true theory depends on facts. But the dependence is not always of the same sort. It may be immediate or through a chain of deduction. Thus when Carey maintains that settlers in a new country cultivate the worse lands first, he depends upon comparatively direct evidence; whereas a critic of Carey's theory brings to bear deductively more general facts of human nature when he humorously doubts whether a settler, having a choice between two equally accessible pieces of land, would reject the better as being too good for the "likes of" him. When the two sets of facts, the general and the special, are consilient, there is the strongest evidence (Mill's *Logic*, bk. iii. ch. xi., bk. vi. ch. ix. x.) When they seem to conflict, care is required to interpret fact by theory and to correct theory by fact. The danger of resting exclusively on abstract reasoning has been shown under the head of DOCTRINAIRE. The converse fallacy, to which the "practical man" is liable, may be noticed here.

"Facts by themselves are silent," says Prof. Marshall (*Principles of Economics*, bk. i. ch. vi. § 3); "they teach nothing until they are interpreted by reason." They are often only "half facts": for instance, the local variations of wages adduced as a fact proving that there is little competitive mobility among the working-classes; the explanation of the fact being that there is a difference of efficiency between the working-classes in the compared districts (*id.* bk. vi. ch. iii. § 2). The reckless use of facts is well exemplified in the controversies about free trade. Many instances of blindly following the suggestion of facts are contained in Taussig's *Tariff History of the United States*. The same facts have been used to prove that raising the tariff increases and that it diminishes prosperity. "One disputant ascribes to a recent lowering of the tariff a result which another says was part of the effect of a raising of the tariff that occurred some years before" (Marshall, *Present Position of Economics*, p. 43). "The most reckless and treacherous of all theorists is he who professes to let facts and figures speak for themselves, who keeps in the background the part he has played, perhaps unconsciously, in selecting and grouping them" (*id.* p. 44). Much the same view as to the need of combining facts with theory is presented by Dr. Sidgwick in his

Scope and Method of Economic Science, Professor Wagner in a communication to the *Quarterly Journal of Economics*, October 1886, and other high authorities living and dead—pre-eminently Mill in his *Logic* and *Unsettled Questions*. A lively statement of the truth here emphasised is contained in Lunt's *Economic Science* (Questions of the Day), 1888.

FAILURE. See BANKRUPTCY.

FAIR PRICE. The word "fair," when used in reference to economic matters, has rarely a scientific meaning. On the assumption that a fair price is one just both for buyer and seller, the proper definition is that it is that price at which the same quantity of a commodity is offered for sale and demanded. It must be observed, however, that the term is in practice never used in this signification. Indeed, it is chiefly met with in discussions on questions relating to land; where it is generally used, not in consonance with, but in contradistinction to, the above definition. The received and now statutory term "fair rent," is perhaps responsible for this use of the term, and in the case of rent of land, as of land itself, there is a possible scientific meaning attachable to the phrase which is not the meaning commonly associated with it. In fact, fair price has come to be applied exclusively to those commodities in which, through some form of monopoly, it is thought that one party to the bargain of exchange has an advantage over the other if the laws of supply and demand are left to work out the price without interference. Thus when it is said that public bodies ought to be allowed to acquire land compulsorily for a fair price, the meaning conveyed is that a computation based on the market value of the land is too high and therefore unfair. A fair wage, it may be noticed, is merely a fair price for labour, and is generally used without reference to the state of trade or of the labour market, but on the assumption that without some interference with the contract for the hire of labour the wage paid will be too small for the proper sustenance of the workman. Such a term, however, is not properly economic (see JUSTUM PRETIUM). M. G. D.

FAIR RENTS. Fair rent, like the similar expressions "fair wages," "fair price" (JUSTUM PRETIUM, *q.v.*), is used to convey an ethical judgment on an economic fact. Applied in a primitive community, it means the customary or usual rent of land, especially when held by a member of the group (Maine, *Village Communities*, p. 187). Again, like fair wages or price, it implies the idea of an amount that will allow the person interested to live—the rent under which a tenant "can live and thrive." The development of economic science brought about the identification of fair rent with competitive or Ricardian rent as paid by a capitalist farmer,—the surplus remaining after expenses of production, ordinary profit included, have been satisfied. Lastly, Mill and his leading disciple Cairnes were led from their study of the Irish land question to separate competitive from fair rent in the case of cottier tenants, and to regard the latter as being equivalent to "economic" rent, from which under the pressure of demand the actual rents paid by the cultivators were likely to diverge. "Economic rent," says Cairnes, "is no other than the fair valuation rent of the good landlord. The fair valuation rent of the popular platform admits, in short, of being reduced to strictly scientific expression" (*Essays in Political Economy*, p. 205). Where competition fails to secure justice the intervention of an external authority becomes necessary. According to Mill rent paid by a capitalist . . . may safely be abandoned to competition; rent paid by labourers cannot. . . . Peasant rents ought never to be arbitrary . . . either by custom or law it is comparatively necessary that they should be fixed" (*Principles*, bk. ii. ch. 10, § 1).

The Report of the Bessborough Commission in 1881 (C. 2779) accepts this view, arguing that there is no "freedom of contract" between landlord and tenant (p. 21) and recommends that fair rents should be fixed "by a constituted authority" (p. 19), and proceeds "to negative the idea that such rent means what in England is known as a full or fair commercial rent, but in Ireland as a rack-rent" (p. 23).

The Irish Land Act of 1881, avowedly based on the Report of the Bessborough Commission, is in fact the legislative enactment of Cairnes's theory as to Irish land rents. It creates a tribunal for the fixing of fair rents, a term which is not further defined, and lays down that the court, "after hearing the parties and having regard to the interest of the landlord and tenant respectively, and considering all the circumstances of the case, holding, and district, may determine what is such fair rent" (44 & 45 Vict. c. 49, § 8).

This measure, which became law on 22nd August 1881, applied to yearly tenancies only; and pastoral holdings over £50 valuation, were excluded from its operation. By an act of 1887 (50 & 51 Vict. c. 33) leaseholders for less than 99 years were admitted to the privilege of having a fair rent fixed.

During the ten years ending 22nd August 1891, fair rents have been fixed or arranged in 277,160 cases, affecting 8,316,878 acres, being over two fifths of the area of Ireland. In these the former rents come to £5,739,153 : 3s., the new judicial or fair rents £4,548,147 : 2 : 8, showing a reduction of £1,191,006 : 0 : 4 or 20·7 per cent. Fuller details are given in the following table.

Table showing the Operation of the Irish Land Acts 1881 and 1887, for the ten years ending 22nd August 1891.

Method of Settlement.	Number of Cases.	Area Affected.	Tenement Valuation.	Former Rents.	Judicial Rents.	Percentage Reduction.
		Acres R. P.	£ s. d.	£ s. d.	£ s. d.	
Rents fixed by Chief and Sub-Commissions (yearly tenancies)	124,451	3,641,428 3 27$\frac{3}{4}$	1,824,080 2 10	2,378,293 16 5$\frac{1}{2}$	1,875,021 19 5	21·2

FAIR TRADE. A term recently brought into use in antithesis to FREE TRADE (*q.v.*) and applied to commerce on which no restriction is imposed by either party or on which equal restrictions are imposed by both. The fair trader regards reciprocity as being essential for fair exchange, and looks on the English system as "one-sided free trade." In consequence of trade depression the Fair Trade League was founded in 1881 to advocate (1) the use of retaliatory duties against countries that tax British exports, and (2) the closer fiscal union of Great Britain and the colonies. The germ of fair trade ideas is to be found in the work of TORRENS (*q.v.*) entitled *The Budget*.

[T. H. Farrer, *Free Trade versus Fair Trade* (4th ed.), 1887.—C. J. Fuchs, *Handelspolitik Englands*, Leipzig, 1893, pp. 157-172 (see RETALIATION), and the publications of the Fair Trade League.] C. F. B.

FAIRS AND MARKETS, THE DEVELOPMENT OF. Before discussing the history and development of fairs and markets in this country, it will be useful to define the meaning of the terms according to the law. "A market, viewed in its strictly legal aspect, may be defined as an authorised public concourse of buyers and sellers of commodities, meeting at a place, more or less strictly limited or defined, at an appointed time." "A market right is a franchise or privilege to hold a market: to this is generally attached the right to levy tolls and other dues." "A fair has been described as a larger market. Thus in Comyns' *Digest* we have the following definition. 'Every fair is a market—not *è contra* therefore when any statute speaks of a fair, a market should also be comprehended.'" "The specific difference between a fair and a market appears to be that a fair is held less frequently, it generally extends over a longer continuous period, and is of a more miscellaneous character than a market." The above definitions are taken from the final Report of the Royal Commission on Market Rights and Tolls (1887-1891). A few comments will serve to explain these definitions. "A market is a public concourse." Therefore a private meeting of traders—as for instance in many so-called corn-markets—is not a market at all; nor are the auction-marts, which are now so frequent throughout the country for the sale of cattle, in any proper sense of the term cattle-markets. "The place of meeting must be more or less strictly limited or defined." The owner of an English market has exclusive possession for market purposes of an area—it may be a manor, or it may be a township—and within that area he is entitled to shift his market from place to place; beyond the limits of the area he cannot move. "The meeting must be at an appointed time." Market days are fixed either by the terms of the grant which creates the market or by length of usage; and the general law is that a change of the day without the consent of the crown will forfeit the right to hold the market. "A market right is a franchise." A franchise is a royal prerogative and is one of those *jura regalia* which the king, if he think fit, can grant

to a subject. No English subject therefore can hold a market unless he can show a grant of this monopoly by letters-patent or such long enjoyment of the right that it will be presumed that a grant was made to him at an early period and has since been lost. "The right to levy toll and other dues" is not a necessary incident of a market. Free markets exist in many places in England, as for instance at Chippenham in Wiltshire. The right to keep standard weights and measures, to hold a market court, and to sentence offenders to fine or pillory, were parts of the privileges of market-owners in the past. Markets are seldom held less frequently than once a week; fairs are seldom held more frequently than three or four times a year. It seems tolerably certain that in origin fairs and markets are distinct. The fair is a holiday or "wake" or festival of a saint, which is incidentally utilised by the itinerant trader for purposes of gain. The name is probably derived from the Latin *feria* (a holiday), and a fair in Brittany at the present day would show us with tolerable accuracy what an English fair was before the Reformation. A market, on the other hand, comes into existence for the express purposes of trade. The Latin name (*nundinæ*) shows that under the Romans a market was usually held once in their nine-day week. From these considerations we can understand why we find in England what are called "pleasure fairs," while such a thing as a "pleasure market" is unknown.

Fairs.—Dealing in the first instance with fairs, it would appear that before the Norman Conquest the ownership of a fair was not a matter of great value. It is observed in an antiquarian report forming the first volume of the proceedings of the royal commission of 1887 that "there are only two notices of fairs in Domesday Book, namely, the mention of the third part of a fair at 'Aspella' in Suffolk and of the *forum annuale* held by the Earl of Moretain at 'Matele' in Cornwall;" and that "even in these instances there is no estimate of annual value, as is usual where markets are described."

The trade of England developed rapidly after the Norman Conquest and under the Plantagenet kings, and its development took a shape which led to the great development of fairs in the direction of trade. It was a natural result of the kingdom of England and duchy of Normandy being in the same hands that trade across the English Channel should become larger, and in Plantagenet times this connection with Europe increased still further, not only on account of the extended possessions of our kings in France, but also by reason of the genius for commerce which more than one of them displayed. For such a foreign trade, at a time when the means of communication were imperfect, the system of fairs was a godsend. The fixed dates at which the fairs were held enabled the merchant or dealer to arrange his circuit with certainty; and thus, at a fair, merchandise would be found which was necessarily absent from the weekly market; or, as the late Professor Rogers expresses it, the fair was "a market in which goods which could not be found in the ordinary town market would be procurable, and in which there would be a wider market for ordinary goods." The same writer gives us a picture of the great fair of Stourbridge near Cambridge, which it is impossible to read without wonder at the present day. The day of the proclamation of the fair was 4th September. On 8th September the fair was opened and lasted for three weeks. "The temporary wooden buildings were commenced by custom on St. Bartholomew's Day, 24th August, and the builders of these houses were allowed to destroy corn grown on the spot with impunity if it were not cleared before that time. The space allotted to the fair, about half a square mile, was divided into streets which were named sometimes by nations, and in each of these streets some special trade was carried on, the principal being foreign spices and fruits, ironmongery, fish, metal goods, cloth, wool, leather, and latterly books." At this fair, as we learn, there would be found traders from the Levant, from Genoa, and from Venice, "war-horses and jennets from Spain, and iron from Seville."

For securing merchants and their goods from robbery and violence we find that from the earliest times a special "peace" was enforced which in course of time came to afford protection to all minor offenders who could find sanctuary within the limits of the fair. A quotation from the Scottish *Leges Quattuor Burgorum* will illustrate this practice.

"This is the ordinance of the peace of fairs in a royal burgh on the hither side of the water of Forth, to wit; That from the time when the peace of the fair is proclaimed, no man be taken nor attached within the time of that fair, either in coming to the fair or in passing thence or in sojourning in the fair itself; unless he has broken the peace of the fair, or unless he be an outlaw of the Lord King or the King's traitor, or such a misdoer as the peace of Holy Church ought not to save. And if he be such a misdoer, or have broken the peace of the fair, he shall be attached securely until the mort of that fair, and there he shall stand for his right, and justice shall be done in the matter whereof he has been charged."

During the continuance of the fair, then, the ordinary executive and judicial officers of the place were ousted of their jurisdiction and were replaced by the officials of the owners of the fair. In the court of PIE-POWDER (*q.v.*) (pieds poudrés) the "dusty-feet" or travelling dealers found a substitute for the ordinary courts of law. There is nothing strange in the lord of the fair thus

usurping the position of the ordinary magistrate; for no principle is more firmly fixed in old English law than the doctrine that ownership of land carries with it the right to hold courts of justice within its limits; and of this doctrine the court of "pie-powder" forms a typical illustration.

The legislation of Edward I. and Edward III. did very much to make the conduct of trade more easy, to prevent the encroachments of middlemen, and to substitute for the special privileges and usages of particular districts a general system of trade for the whole country. Slight reflection will show that the more secure and definite ordinary commerce becomes, the less are periodical fairs required. If the single trader can readily go through the country from day to day, there is no necessity for his customers to come together at stated intervals to meet him. The development of the craft-gilds operated upon the fortunes of fairs from another side. And thus they have long ceased in England to be of importance for trade purposes. Pleasure fairs have also sunk very low. An act of the present reign, reciting that they are often the cause of "grievous immorality," gives power to the Home Secretary to abolish any fair with the consent of the owner. The country would probably suffer very little if all purely pleasure fairs were done away with.

Markets.—Markets, so far as we can judge, were far more numerous and valuable than fairs during the period before the Norman Conquest. The century which followed the taking of the Domesday Survey was a period of remarkable development in town life. The town-gilds, which were one of the outcomes of this development, had for their business "the framing and enforcing a sort of market law—seeing to the weights and measures in use, taking measures for securing and evidencing by their trade-marks the quality of goods exported from the town." The town-gild was in many cases the authority which fixed the ASSIZE OF BREAD AND BEER (*q.v.*), that is to say "the sliding scale by which their values were adjusted as corn varied in price."

The accession of Edward I. is a crucial period in the history of markets. Finding that during his father's reign the rich nobles had in many places usurped the royal rights and abused them for the oppression of the poor, he sent commissioners throughout the country, to inquire in every "hundred" of each shire what were the king's lands and the king's rights there. The results of this remarkable inquiry were recorded in rolls called the HUNDRED ROLLS (*q.v.*), and of these rolls those which relate to seven of the counties still survive. They show by their extraordinary detail how special jurisdictions and special exemptions were spread like network over the country, which must have been most prejudicial to the interests of trade. It was these varieties of local usage, and the abuses they engendered, which Edward I. had to meet by statutes which should apply to the whole realm. Two or three illustrations may show the nature of the evils he had to remedy; their extent may be appreciated when we remember that during the period of seventy-four years, which preceded the commencement of Edward's reign, John and Henry III. had made grants of about 1500 new markets and fairs. The first instance comes from the county of Berkshire, and records that "the burgesses of Wallingford were not accustomed to take toll save only of merchants, but now, contrary to their ancient franchise, they take toll of the men of the country who buy corn and other victuals for their household supplies." In Derbyshire "the masters of the hospital of Yeveley appropriate and attach to themselves men of the royal borough of Assheburn—whereby the king loses toll and passage. And the same masters have made themselves of late a seal for stamping gallons and bushels without warrant, whereas the men of the borough used to have the seal." In Devonshire "the jurors say that the prior of Frompton has toll in his manor of Norham, and that of late only, and takes toll of the men of the said borough wrongfully, to the great damage of the borough, by what warrant they know not." This great survey, or inquisition, was followed by the series of trials of *Quo Warranto*, in which the king tested "by what warrant" the markets were held which were in private hands, and enforced uniformity of practice as a condition of continued enjoyment of the franchise.

The management of markets in Scotland during this period took a different course. Large tracts of country were granted by the crown to various towns as areas within which the "burghs" should have the monopoly of buying and selling. Thus "the royal borough of Rutherglen had by charter rights of taking toll and exclusive dealing over the district where Glasgow afterwards rose."

After the time of the Edwards grants of new markets become much rarer. The decay of the manorial system, and the social changes indicated by the Statute of Labourers and the rising of the villeins give a sufficient explanation of this fact. The demand for grants of letters-patent for new markets steadily decreased during succeeding centuries, until the following result is arrived at, as recorded in the final report of the commission of 1887: "Between the years 1700 and 1846 we have in England and Wales, exclusive of the metropolis, only twenty-four markets created during 147 years; while during the forty-six years of this present century only eleven grants have been made. Two of these were grants of markets in the metropolis; three extended existing rights; and in three of the remaining instances no markets are now in existence." But while

royal grants were becoming obsolete, a system was springing up of creating new markets by private acts of parliament, by special local acts, and by general legislation.

In 1847 the "Markets and Fairs Clauses Act" for the first time codified the "provisions usually contained in acts of parliament authorising the construction or regulation of markets and fairs." But the provisions of this act only apply to markets created by act of parliament after the year 1847, and thus the scope of a very useful act was much limited.

The Public Health Act of 1875 for the first time gave urban sanitary authorities—*i.e.* boroughs, improvement act districts, and local government districts, conditional powers to establish markets. Under this act local authorities may establish markets if they do not interfere with markets already existing; may acquire existing markets by purchase or lease; may provide buildings for the convenient use of the market; may make bye-laws for their regulation; and take rents and tolls for their use. For carrying out these objects the sanction of the local government board must be obtained by the local authority.

There appear to be at the present day some 769 markets in England and Wales, exclusive of the metropolis. Of these 261 are in boroughs, 266 in other urban districts, and 242 in rural sanitary districts. Of the markets held in the boroughs, 216 out of 261 belong to the local authority, of the markets recorded in rural sanitary districts, 142 out of 242 belong to private persons, 18 to trading companies, 24 to bodies of persons other than trading companies, and 8 only to local authorities, while in 10 instances the market rights are questionable, and in no fewer than 40 instances the markets are not held. Thus, speaking broadly, large markets are now in the hands of local authorities and small markets in the hands of private persons. Under the existing law local authorities have no compulsory powers of purchasing markets within their districts which are in private hands. It is not easy to ascertain how far markets are remunerative at the present day. A selection of 40 markets made in the final report of the commission of 1887 shows that on a capital expenditure of over two and a half millions, a return is made of very nearly 6 per cent in tolls and other incomings. The nine markets belonging to the corporation of London on an expenditure of over 3 millions obtain a revenue of nearly 4 per cent.

The accommodation provided by private market owners is often merely an open space, or open street. There are still many cattle markets in England which are held in the streets. Many private owners lease their markets to persons who make a business of taking tolls on hire and making a living out of the difference between the rent they pay and the tolls they collect. In the south of England even local authorities are found to lease their markets in this way. Markets are a decaying institution in the south of England, but flourish in the northern counties.

The majority of the commissioners of the 1887 commission recommended the abolition of market monopolies upon payment of compensation. A strong minority preferred the compulsory transfer of all markets to local authorities.

FAJARDO or FAXARDO, COUNT DIEGO DE SAAVEDRA FAXARDO (1584-1648), knight of the Order of St. James, Spanish historian and political philosopher, was descended from a noble family of Murcia, being the son of Peter de Saavedra and Fabiana Faxardo. He became doctor of laws in the university of Salamanca, and in 1606, as secretary of the viceroy of Naples, Cardinal Gaspar Borgia, commenced a distinguished career in foreign diplomacy, which involved a residence of thirty-four years in Italy, Switzerland, and Germany. He died at Madrid, a member of the council for the government of the Indies. His works were widely read, not only in their original tongue, but also in Latin, Italian, French, and English translations, but neither these, nor any Spanish edition subsequent to the first, have the reputation of being faithful reproductions of the original. The English translation of his most important work, *Idea de un Principe*, published by Sir J. A. Astry in 1700 under the title of *The Royal Politician*, is from the fourth edition (Valencia, 1660). In this book, "under the awkward arrangement of a hundred ingenious emblems, with mottoes that are generally well-chosen and pointed, he has given a hundred essays on the education of a prince; his relations with his ministers and subjects, his duties as the head of a state in its internal and external relations, and his duties to himself in old age and in preparation for death" (Ticknor's *History of Spanish Literature*, iii. 215,216).

Idea de un Principe politico cristiano, representada in cien empresas, Münster, 1640, in 4to.

See also *Obras politicas y historicas*, of Faxardo. Antwerp, 1677-78 and Madrid, 1789-90. C. A. F.

Faxardo represented Philip IV. of Spain at the Congress of Münster, which laid the foundation of the treaty of peace of 1648.

His *Idea de un Principe politico Cristiano* (Idea of a Wise and Christian Prince), written in his leisure moments during his German embassies, and dedicated to the Prince Royal of

Spain, is full of sound and judicious counsel on all matters of state, but rather oddly divided under one hundred mottoes or *empresas*. The author's reflections on economic questions are mostly to be found under the *empresas* LXVI., LXVII., and LXIX. He advocates exemption from taxation for all goods of first necessity consumed by the labouring classes, and holds agriculture to be the principal wealth of a country and the richest mine it can possess. The cost of coinage is the only item that should be added to the intrinsic value of money. Fajardo, however, shares the opinion prevailing in his time that export duties are always borne by the foreign purchaser.

Frequently printed and reprinted, the *Idea de un Príncipe político cristiano* was translated into Italian (Venice, 1648), into French (Paris, 1668), and anonymously in Latin under the title of *Symbola christiana politica* (Brussels, 1649). It is included in Rivadeneyra's *Biblioteca de Autores Españoles* (Madrid, 1853, vol. xxv.) E. Ca.

FALDAGE originally appears to have been the same as faldsoke, viz. the right of a feudal lord to compel his tenants to fold their sheep at night in his fold on his demesne lands, so that his lands might have the benefit of the manure. The term, however, afterwards came to be applied to the money payment for which tenants generally commuted this service.

[Cowell, *Interpreter of Words and Terms*, London, 1701.—Ducange, *Glossarium Mediæ et Infimæ Latinitatis*, Paris, 1733.—Martin, *Record Interpreter*, London, 1892.] A. H.

FALD-SILVER. A customary manorial payment on sheep (see FALDAGE); Vinogradoff (*Villainage in England*, p. 291) considers it an original, not a commuted payment. E. G. P.

FALLACIES may be defined as "apparent evidence which is not real evidence" (Mill, *Logic*, bk. v. ch. i. § 1). Logicians from Aristotle downwards have made it their business to class and label fallacies. The species termed by the schoolmen *a dicto secundum quid ad dictum simpliciter* comprehends many of the bad arguments in political economy; if with Mill we include under this head all cases "where a principle true *in the abstract*, that is all modifying causes being supposed absent, is reasoned on as if it were true absolutely" (see DOCTRINAIRE). A signal instance is the omission of the condition of *time*. It is not true that prices, profits, wages, etc. "always find," but that they "are always finding" their level (Mill, *loc. cit.*) Mill places under this head several economical errors which might also be referred to the fallacy of *composition and division*, that is using a term collectively in one part of an argument and distributively in another. This sort of confusion affects many of the popular errors which economic science has dispelled. Thus, at the root of the mercantile theory lies the fallacy that an increase of money is good for the community, because it is good for the individual. The inflation school of currency commit the same mistake. Many popular fallacies relating to wages fall under the same head. The notion of "making work" by breaking things is plausible only as long as attention is confined to the interest of the particular man who may thus obtain a job. Prof. Marshall well observes of an argument in favour of short hours of work: It rests on the fallacy "that all trades will gain by the general adoption of a mode of action which has been proved to enable one trade under certain conditions to gain at the expense of others" (*Princ. of Economics*, p. 744, 2nd ed.) A similar fallacy affects some of the arguments which are used in defence of trades unions (Cairnes, *Leading Principles*). Prof. Marshall's words are equally applicable to the prejudices which maintain protection. Nor are free-traders free from the fallacy of *composition and division*, when they ignore the distinction between the interest of any particular nation and of all nations collectively. List maintains that Adam Smith has only proved free-trade to be advantageous in the latter sense. Another fallacy often exemplified in economic arguments is *ignoratio elenchi*, not understanding the thesis which you controvert. Refuting the Malthusian theory by showing that in fact population has not outstripped subsistence is an instance of this fallacy (Mill, *loc. cit.*) It would be possible to include other economic fallacies under other scholastic headings. But it may be doubted whether a minute chart, so to speak, of the paths of error is of much practical use. What is required is rather a broad indication which, occurring in the course of one's reasoning, may prevent taking a wrong step. As a danger-signal of this sort may be offered the warning that in political economy a great many mistakes have arisen from treating, as fixed, quantities which are variable. Thus DE QUINCEY (*q.v.*) misses the true theory of value by assuming that the demand for a commodity is a fixed quantity independent of its price. A predetermined fund for purchasing commodities, is hardly less tenable than a similarly-fixed *wage-fund*. The "iron law" that wages tend to sink to the point of bare subsistence is an instance of the same fallacy which has probably affected every theory of distribution down to recent times. It is well shown by Prof. Marshall that the different economic factors "mutually determine one another" (*Princ.*, ed. 1, bk. vii. ch. ii.). Some theories about the rent of ability become insignificant when it is reflected that the margin from which, as base line, the surplus remuneration of any calling is measured, is itself a variable depending on that remuneration (*id. sub voce* "Quasi-Rent"). In economics "all things," or at least most things, "are in flux."

[Effective refutations of economic fallacies are given by Bastiat (*q.v.*). Bentham's *Fallacies* may also be referred to. Of the writers on logic who have treated of fallacies Mill and Whately are particularly suggestive.] F. Y. E.

FALLATI, Johannes (1809-1855), German statistician and economist, was born at Hamburg, where his father, originally of Rovigo (Venetia), was a merchant. Educated at Tübingen and Heidelberg, he was appointed in 1838 professor of political history and statistics at the former university. In 1839 he travelled in England, inquiring into English statistical societies and other institutions. In 1848 he became a member of the Würtemberg parliament, and under-secretary for commerce in the short-lived Frankfurt imperial assembly, 1848, 1849. On its dissolution he returned to an academic career, becoming in 1850 university librarian at Tübingen. From 1844 to 1855, the date of his death, he was joint-editor of the quarterly *Zeitschrift für die gesammte Staatswissenschaft*. During his brief political career Fallati planned and embodied legislative organisation in four directions, viz. the imperial consulate, inland navigation, marine measurement, and—his most cherished idea—an imperial statistical bureau. He also prosecuted inquiry in the question of emigration. To a winning personality and many-sided culture he united clear and practical method.

(1851); on Statistics of Area and Population in British India; and Administrative Statistics in Norway, ix. (1852); on the Statistical Congress at Brussels, ix. (1853). C. A. F.

FALSA DEMONSTRATIO NON NOCET. A wrong description in a will of an heir or legatee does not invalidate a disposition if there is no doubt as to the identity of the person whom the testator had in his mind. (*Inst.* 2, 20, 30; *Dig.* 28, 5, 49, 3.) E. A. W.

FAMILISTÈRE, the name given by Godin (*q.v.*) to the settlement which he founded at Guise, Aisne, France, in 1846. The word is reminiscent of the *Phalanstère* of Fourier, by whom Godin was much influenced.

The Familistère is now a co-operative joint-stock company, possessing iron works as well at Guise as at Laeken in Belgium. A full description of it has already been given under the title Cité Ouvrière, *supra*. An excellent and authoritative account, with maps, charts, and details respecting the nature, organisation, and march of the society, is *Le Familistère de Guise, Association du Capital et du Travail, et son fondateur, J. B. A. Godin. Étude faite au nom de la Société du Familistère de Guise, Dequenne et Cie., par F. Bernardot, Membre du Conseil de Gérance*, Guise, 1889.

FAMILY BUDGET, the balance sheet of receipts and expenses of a family. Such a record is of prime importance in studying the consumption of wealth. It shows directly the standard of comfort and the real wages of the industrial classes, and is particularly useful in estimating the incidence of taxation, constructing weighted index numbers, and judging the various effects of movements of prices. It also brings to light subsidiary sources of income, where these exist, and generally lays bare to the eye of the statistician the whole economic life of the family concerned. The budget should, under ordinary circumstances, cover a whole year, to eliminate, so far as possible, the effect of disturbances due to the influence of climate and season, and to include clothing and other expenses which do not often recur. Budgets were compiled by writers like David Davies and Sir F. Eden in the last century, but their modern history dates from 1855, when important works were published by Ducpétiaux and Le Play. The last-named writer (see Le Play) devoted his life to the collection of budgets and founded in 1856 the *Société Internationale d'Économie Sociale* at Paris, which still carries the work on. Among recent writers on the subject may be mentioned Sargant, Dudley Baxter, L. Levi, Engel, Ballin, Schnapper-Arndt, Grüber, Cheysson, U. Guérin, Hector Denis, V. Brants, L. Bodio, the Countess Pasolini, Landolt, etc. Budgets are now frequently found in official publications (*e.g.* Consular Reports, Blue-Books, Reports of American Labour Bureaus). The subject has also received attention from the International Institute of Statistics, whose *Bulletins* should be consulted.

FAMILY, JOINT (see JOINT FAMILY).

FAMINE.

Economic Study of, p. 19; Social Conditions Predisposing to, p. 19; Price of Corn as a Symptom of, p. 21; Natural Remedies, p. 22; Remedial Action by the State, p. 22.

Famines constitute for the economist a study in what may be called the pathology of wants, and their satisfaction; in them he sees the conditions of some of the greater deviations from that average capacity on the part of production and purveyance to meet consumption, in which economic equilibrium consists. Under certain conditions these deviations find to some extent an index in the fluctuations of price, and hence famine, or scarcity of food, the term being extended only by analogy to other kinds of scarcity (see COTTON FAMINE), has at times been used interchangeably with *dearth* (*dear*-th),—the latter word giving in terms of price that which *scarcity* expresses under the aspect of supply and *famine* under that of felt want or demand. It is more usual, however, to apply the several names to denote different degrees in this kind of economic disturbance. Thorold ROGERS, for example, limited *dearth* to mean a famine in which the rise in the price of wheat is only from 50 to 100 per cent, reserving *scarcity* for those famines in which the increase extends to over twice the average price (*Industrial and Commercial Hist. of England*, p. 59).

A disproportionate intensity of demand for the more important kinds of food in general, as compared with the supply, is here measured in one kind in particular,—the kind which has constituted the staple food of all classes of English people for a good many centuries. For the whole of Great Britain a more comprehensive measure by means of corn averages would be required; for Ireland and some parts of Europe it would be necessary to include potatoes in the computation; and for some Asiatic countries the price of rice would afford a truer index of the presence or absence of famine.

Social Conditions Predisposing to Famine.—As M. A. Legoyt has said: in France *famines* have gradually been replaced by *disettes*, and to day only *chertés* are known.

The causes of present immunity from famine in some countries must be sought, not in milder seasons, nor altogether in that wars are fewer and less barbarous, but in the removal of many circumstances which enhanced the effects of bad seasons, of wars, and other positive checks to life. It is true that modern civilisation tends to develop certain predisposing conditions in the growth of cities and the extension of international division of labour; but through the progress of economic organisation, famine, if it be still a possible disaster, is rendered infinitely less probable. In past ages long immunity from famine rarely happened in Europe. The producer of corn was hampered by his own rudimentary methods of agriculture, by game-laws, and often by heavy taxation, by foreign military service or civil strife. The merchant was impeded by undeveloped communication and transport, by irregularity in international trade, and by a system of state-restriction in the interest of the consumer. The latter was much in ignorance as to the state of the general food-supply,—either was, or imagined himself to be, the victim of the merchant's engrossing and withholding his food, and was prone to panic. Money was scarce; the machinery of credit undeveloped; the money-lender oppressive. Under such circumstances, the introduction of one of the exciting causes of famine—sterile seasons, war, vermin, or pestilence—would be far more quickly and more intensely felt than at a stage of more advanced civilisation.

TOOKE expressed his amazement that parliamentary and other inquiries into the high and low prices between 1793 and 1815 did not assign as the principal cause the varying character of the seasons (*Hist. Prices*, I. iii. § 5). Adam SMITH was convinced that nothing but the waste of war and the fault of the seasons—especially the latter—had ever created a dearth, the violence of well-intentioned governments however converting dearth into famine (*Wealth of Nations*, IV. v.).

To the English economist the narrow margin of surplus corn in the home supply, prior to regular importation on a large scale, and in the absence of any regulated storage of grain, made an absolute deficiency of corn a matter of more than hypothetical interest.

England seldom had a surplus of three months' provision (DAVENANT reckoned it in his time at four to five months' stock) at the new harvest. While the national food supply stood foremost among political questions, economic opinion was divided on the crucial point as to the effective power of either a free or a regulated trade to induce, prevent, or remedy famine.

French economists of the last two centuries, concerned directly with a country of greater area and fertility, were more disposed to see in famines the result of merely partial deficiencies in crops in which collectively there was never a deficit France commanded, even with an ordinary yield

an overflowing abundance of the means of subsistence,[1] and was both self-sufficing and the feeder of her neighbours. A good harvest meant a store sufficient for three years (cp. the allusions to Boisguilbert, Vauban, Richelieu, De Boislisle, Delamare, and Herbert, in Biollay, *Etudes économiques sur le 18me siècle*, 1885). The years of famine during the 17th and 18th centuries—there were forty-one in all—were imputed to commercial speculation, to "the malice of some merchants and regrators" (Delamare, pp. 1007; 954; 707), to the stupidity and brutality of the people (Boisguilbert, vi.), to changes in currency and disordered finances (Forbonnais, *Recherches et considérations sur les finances*, ii.), to the intrigues of officials (Saint-Simon, *Memoires*, ed. Chéruel, v. p. 332), then to those of ministers, finally to those of the king (Biollay, p. 11), and, by Turgot, to the restrictions on inland trade (*Lettres sur les grains*, pp. 27, 109). Necker was slightly more cautious:—*je sçais bien qu'un vuide réel n'existe* presque *jamais*, etc. (*Sur la législation et le commerce des grains*, i. xiii.).[2] And Colbert, a century earlier, by frequently keeping himself informed as to local harvests, was constrained to admit that the great disorder in the finances was due quite as much to the general sterility, involving "an infinity of scarcity and need," which had prevailed in France since the death of Henry IV. (1610-1662), as to official abuses and the exhaustion from long wars (Colbert, *Lettres*, etc., ed. Clément, ii. 5, 8, 10, 19, etc.). Yet in much more recent times Cherbuliez took as the starting-point of his arguments against the interference of the state in the corn-trade the hypothesis of an actually adequate supply (*d'un approvisionnement réellement suffisant*) (*Dict. de l'Econ. politique*, *s.v.* "Disette").

It is contended that India is self-sufficing taken as a whole (Walford), and that her great famines, which are always partial, are, if not wholly preventible, certainly in great measure to be palliated and kept within the limits of a mere dearth. The chief predisposing conditions are local density of population, in conjunction with anti-migratory instincts, disafforestation (till the middle of this century), (see FORESTS), rigidity in taxation of land, absence of diversity of industry, 92 per cent of the population being engaged in agriculture, insufficient irrigation and imperfectly developed means of transport. Storage of surplus grain in pits is largely practised both by cultivators and by merchants, so that the crops of one year are never the only resource.

Famines, however, in India and elsewhere, bear this generic likeness to sorrow, that they come not single spies but in battalions. The seven lean kine which came up out of a seven times shrunken Nile have replicas in every history. The great famines in India have usually been the result of drought continued over two or three years. The record of French famines exhibits, besides shorter periods, series of bad harvests as follows:—

1043-49	1475-77	1692-94
1138-44	1528-34	1708-10
1338-47	1572-74	1788-95
1415-19	1625-31	1811-13
1430-39	1660-63	(*Legoyt*).

The law of the recurrence of famines has occupied economists intermittently from Petty downward, but first took shape as an inchoate scientific hypothesis in the researches made by Hyde Clarke and Jevons. (*Investigations in Currency*, vi.-viii.).

There does not seem to be *conclusive* evidence that a famine ever ensued in Europe in mediæval or modern times solely from what have here been called predisposing conditions. The only doubtful cases in English history seem to be (1) the famine of 1124, spoken of by Simeon of Durham as *magna per Angliam fames*, when the dead lay about unburied in city, village, and cross-road, and to which Penkethman assigns as the immediate cause, the dearth occasioned "by means of changing the coine" (*Artachthos*, 1765); (2) the "great penury" of 1248, "by reason of embasing the coin." There was peace in the former year, civil war in the latter; no mention is made of failure of crops, but it is probable that they were at least deficient.

However necessary a physical or social disturbance of abnormal intensity be to bring about strain and distress amounting to a famine, it is equally certain that men have in many instances so shaped their physical and social environment, "either by blundering, by intention, or even by the zeal of them who govern" (Bandini), as to go far to bring themselves within hailing distance of hunger. Earlier generations are liable to render the land they live in worse adapted for the requirements of their successors by exhausting its resources (Sidgwick, *Principles of Political Economy*, i. iv.). William Rufus is said to have taxed the land so heavily that agriculture was discouraged and famines ensued. There were four in his short reign (Walford). The TAILLE (*q.v.*) crushed the French peasant, whilst the noble was exempted. Rome, both in ancient and modern times, ruined Italian agriculture to indulge itself in cheap bread (Mommsen, *Hist. of Rome*, ii. 394-395; Galiani, *Dialogues sur le commerce des blés*). In 1295 and again in 1390 the export of wool was checked through our anxiety to secure coin at staple towns; the slender capital of the period was not "turned" and men famished (Penkethman; Knyghton). Fearful that corn might be exported in the famine of 1438-39, the government refused to take the more positive remedy of relaxing the restraints on inland water-carriage. Commerce, it is true, "recognising neither king nor country," will go on exporting grain, while the people are famishing, as in England, 1586, 1595, and 1709 (see speeches of Queen Elizabeth and Queen Anne); and *Parliamentary Hist.*, vi. 802); Tudor kings, by issuing base money, have made famine "endemic" (Th. Rogers); and under a republic depreciated *assignats* may intimidate the farmer from bringing corn to a hungry town (Thiers, *Hist. de la Révolution*, iii. 93, etc.). Neglect of reservoirs have been a potent factor in enabling a scarcity of crops to dissolve Ceylon villages. Over-population may, as in the great Irish famine, be suffered to precipitate unchecked the action of the law of diminish-

[1] In the famine 1528-34, owing to heat and vermin, the harvest barely furnished enough grain for sowing (Delamare; cp. Legoyt).

[2] He would not admit that restrictions had ever occasioned *disette* or *cherté*, ii. cp. vi.

ing returns (Cairnes, *Fragments on Ireland*). The result of a relatively rigid law assessing wages, and a relatively elastic assize of bread, "necessarily brought want and starvation to the labourers" when corn grew suddenly dear (Denton, *England in the 15th century*, p. 96). Dependence on a staple commodity is in itself a risk. And ignorance generally, rendering man weak in wielding natural forces, strong in hatred of his neighbour and superstitious as to cause and remedy, is a predisposing condition implied in all the rest, constituting at times well-nigh an efficient and sufficient cause of famine (cp. Hazzi, p. 15; Leland, *Etruscan Roman Remains*, i. x.; King, *Italian Valleys*, p. 132).

On the other hand a country predisposed by physical conditions to scarcity, as *e.g.* Holland, may by effective organisation and enterprise have remained a stranger to national famishment (cp. Blanqui, *History of Political Economy*, p. 314).

Price of Corn as a Symptom of Famine.—That scarcity in the supply of corn (where corn is the staple food) is dearth in terms of price, is a truism. Observation, however, has shown that the price does not rise in the same ratio as the supply falls short. In an article used as a prime necessity of life the elasticity of demand is at a minimum, while the demand itself is habitually at a maximum. Thus when the supply is checked consumption is reduced reluctantly, creating the purveyor's opportunity and then the producer's. The intensity of demand has moreover ever been rendered the more stubborn at the rumour of a scarcity of bread, "by emotions against which reason is of no avail, and out of which populations are not to be educated" (Dupin, cp. Biollay, p. 22). "There arises a sort of general scramble for the scanty and waning stock" (Fullarton, *infra*, c. v.; Necker, *op. cit.* i. xiii.), which DAVENANT (*q.v.*) formulated by the famous law called after Gregory KING.

In considering this formula it must be borne in mind that fertile years beget confidence and check dearth; a bad year accelerates alarm in the next. The famine of 1390 was preceded by years of such plenty that it was believed a five years' stock might have been accumulated and the price rose not much (*non nimis excessivum*, Knyghton).

The maintenance of a heavy outlay for bread in times of scarcity involves a redistribution in the demand for other commodities. "Famine depreciates all but food" (F. Newman, *Lectures*, p. 85); but this must be accepted with reservations. "Fancy" foods will depreciate (Roscher, 61), although in a siege famine they may command a fancy price at the outset (Labouchere, *Diary of Besieged Resident in Paris*), but there will be an appreciation in the price of all the "surrogates" of the staple article of food, partly because they are scarce from the same cause, partly owing to increased demand. "Men," as Locke put it, "would not rob themselves of all other conveniences of life by paying all their money for wheat, when oats, that are cheaper, though with some inconveniences, would supply that defect" (*Several Papers on Money*, 1696, p. 48). If all kinds of corn have been deficient, grass, especially in a wet famine, and roots may be abundant, and dairy produce and mutton not much affected, although the cost of fattening cattle will tell on beef before long. If the course of prices be traced in Thorold Rogers's tables during *e.g.* the chief famine of the fifteenth century, 1438, it will be seen that oxen rose in price in about the same proportion as corn, but not till the year after; wool, wine, and salt fish rose also, but pigs and sheep did not. Again, in the famine 1647-49, 1648 being the dearest year for corn; butter and candles rose in years 1 and 2, then fell; sugar and beef rose in all three years, sheep first fell, but shot up in year 3.

Disturbances and readjustments such as these are but the upper layer in the basket. The poor, when corn rises out of reach, betake themselves to inferior food, unless, indeed, by habitually living on something cheaper than corn, they have no such resource left them. Herein is another limitation to the sufficiency of the price of corn as a criterion of plenty or dearth. In the reign of Edward II. when the purchasing power of the people had been brought very low by the wars of Edward I., and a series of unproductive harvests supervened, wheat often entered in very moderate proportion into the loaf of the great bulk of the population, chestnuts, acorns, and fern-roots being substituted (Denton, p. 91). Waster, in *Piers Plowman* (W. Langland, c. 1332-1400) when gripped by Hunger, is glad to eat the horses' beans; bark has been much sought after both in European and Chinese famines, nor has exception been taken to dogs, cats, and vermin, dead bodies and living children, while the newly-imprisoned thief has found prompt sepulture in the stomachs of famished captives (cp. the accounts of English chroniclers in the writings by Farr and Walford referred to below).

Finally, excessive mortality, both through want and "famine fever," and other want-engendered illnesses (as well as at the hand of the enemy in case of war), constitutes a slackening in demand and a consequent modification in the movement of price, which is hardly a positive symptom of the cessation of famine. The excess over the average annual deaths in Ireland during 1846-47 amounted, taken together, to 216,716, of which 208,617 were the result of famine fever. Nevertheless 9395 died of starvation in the two years following, when prices had abated, wheat being cheaper than for sixty-seven years past, viz. 38s. 6d. (cp. Walker, *Wages Question*, p. 111).

The harrying of Northumbria by William the Conqueror in 1068, leaving a few survivors "to live like beasts of the field" and surrender themselves as slaves (Stubbs, *Hist.*, i. 78), the Black Death, 1349, when cattle roamed loose and corn rotted in its abundance, and "there were small prices for everything," yet the survivors feared to touch the plague-infected food (Knyghton), are instances of dislocation in the equation of supply and demand not easily interpreted by readings of price. DEPOPULATION itself, as a symptom of famine, is significant enough (*v. sub voce*). Mediæval towns have cast the beggar and the "casual" out of their gates in time of scarcity (Villani, Voigt, Wachsmuth, cited by Roscher). Famine, as checking population, has been held a necessary condition of internal peace in China, (Malthus, *Essay*), and has been tolerated as a chronic easing-off of demand in modern Europe.

Cantillon commented on the poor dying of "la misère, comme nous le voyons journellement en France." The peasant of southern Italy emigrates from sheer destitution (Nitti, *Rev. d'Ec. Polit.*, July 1892); and the history of industrial centres tells of chronic misery which has suffered, out of 21,000 infants, only 300 to survive their fifth year (cp. Schönberg's *Handbuch der polit Oekonomie*, i. 689, n. on "Starvation Diseases"). Histories, such as Malthus desiderated, of the nations viewed as mostly poor people, will, with him, look on years of plenty as "interrupting causes, obscuring" the normal working of the great ultimate check to population.

Natural Remedies to Famine.—In the natural course of things "while the earth remaineth, seed time and harvest . . . shall not cease," the heat of war dies out, the recuperative recoil characterising the springs of human energy after mishap asserts itself markedly in obliterating the traces of famine (cp. Malthus, *Essay*, ii. xiii.) and by natural selection the predisposing conditions are re-adjusted. Dupont de Nemours's saying, *Ce qu'on l'appelle cherté est l'unique remède à la cherté*, is applicable both to the extended operations of the cultivator and the merchant, encouraged by the high price of corn, and also to restricted consumption. Demand for bread may suffer some contraction without entailing suffering. Penkethman even assigns wasteful "use of the creature" as a cause of famine (*e.g.* in London in 1369).

Nor is corn the staple food it once was. Tooke was careful to omit the labourers from that "agricultural interest" which derived benefit from scarcity. The wages of labour do not rise in full proportion to the advance in the price of provisions (i. 2). In a long famine they do rise especially, Thorold Rogers found, in the case of the worst paid kind of labour, as for instance, the wages of women and threshers of oats (*Econ. Interpretation of Hist.* i. 16, 17). The rise, after 1315 and 1621, was 10 per cent.

Theoretically the collector and redistributor of the annual supply of corn should, by steadying the fluctuating price of corn, be both a preventive and remedial force with regard to scarcity. But his aim being to produce profit rather than plenty, and often short-sighted at that, his power also, where publicity was small, being very great, he has been wholly mistrusted by the consumer as a "dearth-desiring Hoorder" (see FORESTALLERS AND REGRATORS, cp. Proverbs xi. 26).

Importation of German corn, as a remedy in time of famine, is mentioned in connection with the scarcity of 1258, and often subsequently. Knyghton accounts for the cheapness of corn at London, as compared with his native town of Leicester, through the number of grain-ships meeting in the Thames. Davenant, while estimating that the variety of soil and elevation in our corn-fields rendered us the less liable to more than local dearth, deemed us only "safe because we have everywhere the sea to friend." In modern times the advent of Russia to the international corn-market (in the French famine 1778; South Russia in 1816-17), and of America in the middle of this century, more recently of Australia and India, minimised the chances of serious famine in Great Britain.

Remedial Action by the State.—This may briefly be analysed as follows:—

1. Subvention of the corn trade, viz.—(*a*) Regulated collection and distribution of corn in public granaries. Burke could point to the farmer's rick-yard and barn as the only British granary, but English economists have winced at Holland, with her well-stocked "conservatories," retailing to us our own grain (Davenant. Cp. *Britannia Languens* and Sir W. Raleigh, p. 303, etc. "a dearth of only one year in any other part of Europe enriches Holland for seven years" (*Observations upon Trade*). (*b*) Purchase of foreign corn, the drain of bullion to effect which, was often a source of financial anxiety (Fullarton). (*c*) Restriction of export of corn. (*d*) Suspension of duties on Imports. (*e*) Bounties on imports of corn. (*f*) Suspension of bounties on exports, "a peculiarly English policy," pursued since the 15th century (Cunningham, *Growth of English Industry*, etc., Modern Times, p. 372).

2. Subvention of the producer by advance of loans, as in recent Indian and Russian famines. A developed banking system may herein replace the state (Fullarton, Roscher).

3. Economising the supply of corn by prohibiting the use of barley in brewing and distilling, or that of flour for hair powder; or the sale of bread before it is stale.

4. Compulsory lowering of the price of corn and bread.

5. Relief works and gratuitous distribution.

6. Publication of corn statistics.

A. F.

FARMER-GENERAL. From early times it was the custom in France to farm out a tax to a contractor, who having advanced a fixed sum to the government, collected and pocketed the tax which he had bought. In 1697 the indirect taxes, customs, excise, *octroi*, taxes on

wine, salt, tobacco, oil, and manufactures, were collectively leased to a body of financiers, thenceforward distinguished by the name of farmers-general (*fermiers généraux*), to show that their powers of collection were general, and not confined to one particular tax. These farmers, sixty in number, were appointed by the king for periods of six years, and they paid an agreed sum in advance year by year. Their selection was largely governed by court favour, and the coveted contracts were often awarded to needy favourites who found wealthy financiers willing to surreptitiously share the transaction. The privileges of the farmers yielded to the government—

In 1697	37	millions of	francs.
1743	64	„	„
1763	90	„	„
1786	112	„	„
1789	180	„	„

There can be no doubt that the farmers' profits were, as Adam Smith says, "exorbitant" (*W. of N.*, bk. v. ch. ii.), and the cost of collection "wasteful and expensive." The amount taken out of the pockets of the people was thus out of all proportion to the amount received by the state (see especially Necker's remarks upon this subject, *De l'Administration des Finances*). Moreover, the taxes, grievous in themselves, were collected harshly. Domiciliary visits, the seizure of goods suspected to be smuggled, and the efforts to capture smugglers who were, if caught, sent to the galleys or the gibbet, caused frequent personal collisions between the agents of the farmers and the public, often resulting in bloodshed. "Those who consider the blood of the people as nothing," says Adam Smith indignantly, "in comparison with the revenue of the prince, may, perhaps, approve of this method of levying taxes." The ostentatious luxury in which the farmers lived accentuated the popular anger against them, though their riches were sometimes antecedent to their contracts; and though some of them made a noble use of their wealth, *e.g.* Beaujon, who founded a hospital, Helvetius, Dupin, and Lavoisier. The Convention prosecuted the farmers-general as enemies of the people, and thirty-five of them, including Lavoisier, were guillotined. The Constituent Assembly abolished the system of farming-out the national revenues. The farmers-general have thus a history of less than a hundred years.

The disfavour in which they were held is best illustrated by a story told of Voltaire, who once gave a dinner at which the talk fell upon the exploits of famous robbers. When each guest had recounted some notorious exploit, Voltaire was pressed for a story in turn. "There was once upon a time," he began, "a farmer-general . . . "; then after mock hesitation, "I forget the rest!"

[Most French writers on finance refer to this subject. Sully scolded the farmers as vigorously as Turgot, and Necker criticised them sharply. On disadvantages of the system, see Adam Smith, *loc. cit.*, Cost of Collection of Taxes; Farming of Taxes; Indirect Taxation. On the other hand, it is contended that the necessary defects of the system are not considerable. J. B. Say thought the French post office might have been farmed out with advantage, and better managed by men of business who were not state officials, maximum rates being fixed by the government (*Cours Complet d'Écon. Pol.*, ii. 413). The money order department of the English post office has only ceased to be farmed out within about the last 18 or 19 years (1905). Comp. Publicani.] H. H.

FARMERS' ORGANISATIONS IN THE UNITED STATES.

Order of Patrons of Husbandry, p. 23; National Farmers' Alliance and Industrial Union, p. 24; Farmers' Organisations in the North and West, p. 24; Coloured Farmers' National Alliance and Co-operative Union, p. 25; Other Organisations, p. 25; General Principles and Present Demands, p. 25; Ocala-Indianapolis Demands, p. 25; Business Features, p. 26; Political Action, p. 26.

The Order of the Patrons of Husbandry.—The first great farmers' organisation in the United States was a secret society founded December 1867, under the name "Order of the Patrons of Husbandry," but more familiarly known as "The Grange"; not an accurate designation, as the word "grange" is a term applied to one of the units of the order, as for example the local grange, the state grange, etc. (see Granges). The aim of the Patrons of Husbandry was to bring the farmers into closer relation with one another, and thus to lessen the disadvantages of the isolation in the farmer's life, Social intercourse was emphasised and the educational features, including courses of reading and study, were made prominent; and it was sought to render life on a farm more attractive, especially to the sons and daughters of farmers. Economic purposes were from the earliest days leading features in the activity of the order, and for a time a large measure of success in distributive co-operation was achieved. The farmers sought to meet combination with combination.

A movement among the farmers to correct railway abuses had begun before the Patrons of Husbandry became a great power, and this order naturally enough joined in the struggle, and soon became the chief factor on the side opposed to railway corporations. Stringent laws were passed to regulate railways, railway commissions began to be created in various states, and this movement continued until now we have such commissions in most of the states of the union, and also a federal commission, called the Inter-State Commerce Commission. These laws were not always wisely conceived, the railway corporations rallied their forces, and finally a reaction began, which among other things weakened the Patrons of Husbandry The order spread rapidly until 1874, when it

claimed a half-million members, and then began to decline in numbers and influence. One evil in the order was the presence of professional politicians and other designing persons slightly or not at all connected with agriculture, who attempted to use it for selfish ends. Membership was accordingly restricted in that year and limited to persons actually engaged in agriculture, and a few others, such as editors of agricultural periodicals and country mechanics who could reasonably be supposed to be in active sympathy with agricultural interests. The reaction following the meeting of 1874 continued for a long time, but recently the order began to grow again, stimulated no doubt by other powerful organisations, and it now claims to have organised 26,500 sub-granges, with an aggregate membership of 1,325,000. Deducting one-half of this number for extinct granges, gives a conservative estimate of 662,500 as the present membership. For a long time the political influence of the Patrons of Husbandry had been so slight as to attract little attention, although it has doubtless had some influence on legislation, even in recent years. The members of the order have for the most part acted with one or other of the two great parties, the Republican and the Democratic, and it is now the most conservative of the farmers' organisations of the United States. Its influence is chiefly social and educational, and it furnishes an excuse for annual gatherings of farmers' families, in which amusement is as prominent a feature as speech-making.

The National Farmers' Alliance and Industrial Union.—The Order of the Patrons of Husbandry is called the mother of the Farmers' Alliance, and it has undoubtedly, directly and indirectly, had great influence upon all the other farmers' organisations which have in recent years come into existence. The farmers turned from the grange to organise more radical orders, and these began to exist at about the same time in various parts of the south and west. Their purposes were similar, their platforms all having a striking resemblance to one another, owing to the similar conditions out of which they grew ; and the various organisations coming into closer connection produced the present "farmers' movement."

The National Farmers' Alliance and Industrial Union is at present the greatest farmers' organisation in the United States, and is perhaps the most powerful organisation of farmers known to history. It and the Patrons of Husbandry are to be remembered as the two chief farmers' organisations which have thus far arisen in America. The National Farmers' Alliance and Industrial Union may be traced back to a local society in Lampasas County, Texas. The precise date of its birth is a matter of dispute, but it was somewhere between the years 1870 and 1875. The Local Texas Farmers' Alliance was organised to protect the farmers against cattle thieves and "land-sharks," that is speculators in land, especially dishonest speculators and land thieves. The scope of the local society was enlarged, and in 1879 the Texas State Alliance was formed, one year later it received a charter from the state. This grew and united with other societies. There had arisen an order in Louisiana called the Farmers' Union with similar aims. This was the first larger order absorbed. The two consolidated in January 1887, at Waco, Texas, and took the name National Farmers' Alliance and Co-operative Union. As this society grew, it came in contact with the National Agricultural Wheel, which was founded in Arkansas in 1882, and was at first a local body. It grew rapidly and had membership in most of the southern states in 1887, and claimed a half-million members. Its avowed purposes were so similar to those of the National Farmers' Alliance and Co-operative Union that a plan of fusion was arranged at Meridian, Miss., in 1888, and having been ratified by three-fourths of the local organisations of both societies, the Union was declared in force 13th September 1889, and the new order became known as the Farmers' and Labourers' Union of America.

Farmers' Organisations in the North and West.—The organisations just mentioned operated chiefly in the southern states of the union, but similar bodies in the north and west had begun to make themselves known, of which the most important was the National Farmers' Alliance, sometimes called the Northern Alliance as the other society is occasionally, though now with less propriety, called the Southern Alliance. The National Farmers' Alliance grew from a local society established in 1880 to a national body organised in 1887 and claiming, in 1889, a membership of nearly 400,000. This was a non-secret order, whereas the National Farmers' Alliance and Co-operative Union was a secret order with grips and passwords, but the purposes of the two organisations were the same. Still another society with like aims was founded in 1883 in Southern Illinois. This was the Farmers' Mutual Benefit Association. It soon acquired a membership in Missouri, Kentucky, and Kansas, as well as Illinois, becoming a national organisation in 1887. A fruitless attempt to unite these orders was made in St. Louis in December 1889. Personal ambitions, sectional animosities, the race question, and the question of secrecy or non-secrecy seem all to have had more or less influence in preventing a fusion ; nevertheless they came into closer relationship with one another, and have since then been acting together in the pursuit of their aims.

The Knights of Labour were represented by delegates at St. Louis, and thus were brought together urban mechanics, employés chiefly,

and farmers, not employés, but in so far as they did not cultivate their farms alone, employers rather than employés. Thus began a strange and probably hitherto unknown combination of industrial classes for political aims. A platform was agreed upon, acceptable to all, and this platform embodied what is known as the "St. Louis demands." In anticipation of fusion with the Northern Alliance the name of the Farmers' and Labourers' Union of America was changed at St. Louis to National Farmers' Alliance and Industrial Union. This is the body almost invariably meant when the Farmers' Alliance or The Alliance is mentioned in the press, and it has in fact extended its membership into states in which the National Farmers' Alliance was formerly strong, and appears nearly to have absorbed the latter.

The Coloured Farmers' National Alliance and Co-operative Union. — Only one other prominent farmers' organisation remains to be mentioned, and this is the Coloured Farmers' National Alliance and Co-operative Union. All who know the south in the United States will at once understand the difficulties in the way of common action of whites and blacks in a single society. A coloured alliance was established in Houston County, Texas, in 1886, and in 1888 it became a national body with the above-mentioned name. In 1891, it claimed a membership of considerably over a million, and representation in thirty states. It held a meeting in Ocala, Florida, in December 1890, at the same time when the National Farmers' Alliance and Industrial Union met; friendly greetings were interchanged, and it virtually agreed to act with the organisations of the white farmers for the attainment of the "St. Louis demands." The Farmers' Mutual Benefit Association also held a meeting at the same time and place, and appears to have come nearer to the other organisations present.

Other Organisations.—Other organisations are heard of here and there, as the National Farmers' League, the Farmers' National Congress, and the Supreme Association of the Patrons of Industry of North America—not the Patrons of Husbandry already mentioned—but all these are of minor importance. The Citizens' Alliance (Mrs. Annie L. Diggs, Washington, D.C., Secretary; Noah Allen, President) may be mentioned as an attempt to organise professional and business people in the cities, and thus to enable them to act with the farmers' organisations.

General Principles and Present Demands.— All the farmers' organisations have a statement of general principles similar to that of the Alliance, in which expression is given to feelings of fraternity and general goodwill to mankind, a determination to promote the education of the farmers is avowed, and sectional prejudice is condemned. The immediate demands of the Alliance are stated in the platform adopted at St. Louis, which was endorsed by the Knights of Labour. As amended at Ocala in 1890, and at Indianapolis in 1891, the platform reads as follows:—

Ocala-Indianapolis Demands:

1. (*a*) We demand the abolition of national banks.

(*b*) We demand that the government shall establish sub-treasuries in the several states which shall issue money direct to the people at a low rate of tax, not to exceed 2 per cent per annum on non-perishable farm products, and also upon real estate, with proper limitations upon the quantity of land and amount of money.

(*c*) We demand that the amount of the circulating medium be speedily increased to not less than $50 per capita (say £10).

2. We demand that Congress shall pass such laws as will effectually prevent the dealing in futures of all agricultural and mechanical productions; providing a stringent system of procedure in trials that will secure prompt conviction, and imposing such penalties as shall secure the most perfect compliance with the law.

3. We condemn the silver bill recently passed by Congress, and demand in lieu thereof the free and unlimited coinage of silver. [The Silver Bill condemned was that of 14th July 1890, providing for the purchase of 4,500,000 ounces of silver bullion per month.]

4. We demand the passage of laws prohibiting alien ownership of land, and that Congress take prompt action to devise some plan to obtain all lands now owned by aliens and foreign syndicates; and that all lands now held by railroads and other corporations in excess of such as is actually used and needed by them be reclaimed by the government, and held for actual settlers only.

5. Believing in the doctrine of equal rights to all, special privileges to none, we demand—

(*a*) That our national legislation shall be so framed in the future as not to build up one industry at the expense of another.

(*b*) We further demand a removal of the existing heavy tariff tax from the necessities of life, that the poor of our land must have.

(*c*) We further demand a just and equitable system of graduated tax on incomes.

(*d*) We believe that the money of the country should be kept as much as possible in the hands of the people, and hence we demand that all national and state revenues shall be limited to the necessary expenses of the government economically and honestly administered.

6. We demand the most rigid, honest, and just state and national governmental control and supervision of the means of public communication and transportation, and if this control and supervision does not remove the

abuse now existing, we demand the government ownership of such means of communication and transportation.

7. We demand that the Congress of the United States submit an amendment to the Constitution providing for the election of United States senators by direct vote of the people of each state.

Demand No. 6 was substituted for the St. Louis demand for complete ownership and operation of the means of communication and transportation. At a meeting of representatives of farmers' organisations and other organisations, most prominent among which were the Knights of Labour, the original St. Louis demand for complete ownership and operation was adopted as a platform for independent political action.

The following tabular statement gives some leading facts touching the different farmers' organisations mentioned :—

	Patrons of Husbandry	Southern Alliance [1]	Northern Alliance	Mutual Benefit Association	Coloured Alliance
Date of Organisation	1867	1870-1875	1880	1883	1886
Character of Ritual	Secret	Secret	Non-Secret	Secret	Secret
Estimated Membership [2] 1892	662,500	3,000,000	200,000	150,000 [claimed membership in 1890]	1,250,000
Demands.

Abolition of National Banks	*	*	*	*	*
Establishment of Sub-Treasuries		*		*	*
Prohibition of Alien Ownership of land	*	*	*	*	*
Government Ownership of Railways		*	*	*	
Tariff Revision	*	*	*	*	*

An asterisk (*) indicates that the "demand" appears in the platform of the particular body designated.

Business Features.—The Alliance has made various efforts in business, all of which have been, to a greater or less extent, co-operative. Co-operation in buying and selling has been the chief of these, but mutual insurance has been a prominent feature. "Alliance Exchanges" have transacted business amounting to many millions of dollars; and although these appear to have failed frequently or suspended, the claim is made that the gains to the farmers can be counted by the million. The abolition of the middleman is one of the goals of the Alliance.

Political Action.—The different farmers' organisations claim to be non-partisan, but the Alliance avows a willingness to use parties as "a method" of attaining their ends. At first there was an evident desire to work through the old parties, but the feeling that independent political action is a necessity has grown. A "third party," composed for the most part of members of the alliance, has made itself prominent in the country, and in 1890 astonished the politicians by capturing two states and gaining important positions in others; while in some southern states the alliance seemed to have gained control of the democratic party. In that year the alliance had nine members, chosen as "third party" candidates, in the House of Representatives, and claimed twenty-six members elected as democrats. There were also two members in the senate.

The Knights of Labour and the farmers' organisations are not in so many words committed to a third party, but the third party was formed by delegates from these organisations, and the same men are prominent in both. The members of the organisations appear to have liberty to vote as they please, but these organisations are the recruiting grounds of the "third party."

The meeting at St. Louis, February 22-24, 1892, already alluded to, adopted a platform called "The Second Declaration of American Independence" of the "Confederated Industrial Organisations of America." The preamble begins with these words: "This, the first great labour conference of the United States, and of the world, representing all divisions of urban and rural organised industry, assembled in national congress, invoking upon its action the blessing and protection of Almighty God, puts forth to and for the producers of the nation this declaration of union and independence."

The platform resembles closely that of the Alliance already given, except that a "land plank" is added which reads as follows :—"The land, including all the natural resources of wealth, is the heritage of all the people, and should not be monopolised for speculative purposes, and alien ownership of land should be prohibited.

"All land now held by railroads and other corporations in excess of their actual needs, and all lands now owned by aliens, should be reclaimed by the government and held for actual settlers only."

A demand for a Postal Savings Bank is added, and the incorporation of the telegraph and telephone as part of the postal system is specially mentioned as a desirable reform. The whole platform is described as a "three-fold

[1] This is the main body, familiarly known as the Alliance or Farmers' Alliance.

[2] These estimates are not vouched for by the writer of this article.

contention of industry," for it is divided into three parts, viz. money, land, and transportation, but the money part is most emphasised. A convention to nominate candidates for the political campaign of 1892 met at Omaha, Nebraska, in July. This movement was inaugurated and carried on chiefly by members of the Farmers' Alliance, though others were invited to co-operate. In order to attract various classes of voters the name "People's Party," used in the campaign of 1890, was adopted as a national party name. In the general election which took place in November 1892, General Weaver, the party's candidate for president, received a popular vote of about a million and a quarter, and obtained twenty-two votes in the electoral college. The party has eight members in the present (1893) House of Representatives and three in the Senate. The most prominent of the representatives is Mr. Jeremiah Simpson of Kansas, and the senator most frequently mentioned is Mr. W. A. Peffer of the same state—the state indeed in which the Alliance has secured its greatest victories. Immediately after the election an effort was made to repress the partisan tendencies of the Alliance, but without avail.

Peculiarities.—It must be remembered by English readers that the American farmer is a proprietor, but that means a peasant rather than a European landlord. The American farmer dreads becoming a tenant, and the fear that he may become one is a partial explanation of the farmers' movement. He has heard much of rack-rented Irish tenants, and he sees something of rack-renting in his own country. The farming and peasant class is regarded by conservatives as a bulwark against revolutionary tendencies, but the American farmer appears to have become revolutionary, and his organisations have joined hands with the Knights of Labour. Perhaps to the economist the most remarkable peculiarity is that already mentioned, viz. the combination of organisations of landowners with organisations of wage-earning mechanics.

Causes.—It would require a treatment of recent American economic history to explain the causes of the present American farmers' movement. The contraction of the currency at the close of the civil war, lowering the price of land, and raising the value of mortgages, is one cause; another is the extension of the means of communication and transportation, increasing the supply of available agricultural land, and lowering the prices of agricultural products. The American railway system, which has entrusted the ownership and operation of railways to private corporations, whatever may be its advantages, has been productive of grave abuses; and these have had something to do with the discontent of the farmers. Great fortunes and urban luxury, of which the farmer hears much and of which he catches glimpses, may be also mentioned as a general cause.

The Future.—An estimate of the future farmers' organisations is so difficult that a wise man will be extremely careful in making one. The past would seem on the one hand to justify the belief that large political results ought not to be anticipated in the near future; on the other, that if the present organisations disappear, they will be succeeded by others. A clearer, fuller, more scientifically elaborated economic "platform" would also seem to be a condition of permanence as a political factor, but this may come as the result of continued discussion.

[Nothing like an accurate account of the farmers' organisations of the United States has appeared. They are mentioned in their connection with the labour movement in Ely's *Labour Movement in America* (New York, 1886). Mr. N. A. Dunning, who is connected with the Farmers' Alliance, has edited *The Farmers' Alliance History and Agricultural Digest* (Washington, D.C., 1891). This contains historical sketches of the principal farmers' organisations, and a number of essays upon topics connected with their demands or activity. Senator Peffer explains his monetary ideas in *The Farmers' Side* (New York, 1891). Annual reports of the various bodies are important but difficult to obtain. The periodical literature is vast. It is said that over 1000 newspapers now advocate the platform of the Alliance. The principal of these is the official organ of the Alliance, *The National Economist*, published in Washington, D.C. The *National Economist* has issued considerable pamphlet literature of importance as hand-books, tracts, etc. American magazines contain many articles about the Farmers' Alliance. Various numbers of the *Arena* for 1892 may be mentioned as containing articles favourable to the Alliance. The "Farmers' Alliance," by W. A. Peffer, in the *Cosmopolitan* for April 1891, gives a historical view. A more critical sketch is that which appears in the *Political Science Quarterly* for June 1891, by Frank M. Drew, entitled "The Present Farmers' Movement."]

R. T. E.

FARMING. This word has come to signify in general the cultivation of land, as a farm is a portion of land cultivated as one holding. But it is derived from a Saxon word signifying provisions, and was originally applied to the rent reserved for the use of land by a tenant, which in early times was in the form of a portion of the produce. When in money it was called "*alba firma*," meaning silver. So in Scotland "a victual rent" is still used to express a rent consisting of a certain quantity of grain, though that is now converted into its current equivalent in money as ascertained by the FIARS PRICES. For the purpose of the present article farming will be understood to be the system of letting land for cultivation to a tenant, who finds the whole of the capital, and pays the rent reserved to the landlord,

whether as a definite quantity of produce or as money. Where the landlord finds part of the capital, and receives a share of the produce, the arrangement follows the system of MÉTAYAGE.

The cultivation of land by interposition of a tenant belongs almost necessarily to a somewhat advanced stage of social organisation, and to conditions in which large domains are held by one individual. In the earliest times the land of a tribe was held in common, and after separate property began to be recognised, the several portions were only such as one family could cultivate. With the division of labour, however, there occasionally occurred cases in which it was convenient that the owner should follow some different pursuit, and then the land might be for a consideration handed over to the temporary occupation of another. Such an arrangement was called by the Romans *precarium* whenever it endured only at the pleasure of the owner. The term *locatio* was applied when the land was let for a definite period. But the large estates acquired by Roman magnates towards the close of the republic and under the empire were chiefly cultivated by slaves working under the stern discipline of a steward, himself generally also a slave.

During the middle ages the aggregation of land in large estates under the Feudal System (see FEUDALISM) gave rise to various methods of holding. Part of the extensive grants from the crown were by subinfeudation transferred to smaller owners,—for military service, or for certain dues payable on occasion of the lord's exigencies, and occasionally for some small annual rent in money or kind. But the chief lords, as well as the subordinate tenants, drew the main part of their subsistence and revenues from the domain or "demesne" lands which they retained in their own occupation. The cultivation of these lands was carried on partly by dependents who were wholly maintained by their lord, partly by means of services reserved from bondsmen, or peasants, who received a grant of so much land as sufficed to maintain them, subject to the obligation of giving the services necessary to cultivate the lord's domain lands. This system continued to prevail generally on the continent till it was put an end to in France by the revolution, in Germany by the land reforms of Stein and Hardenberg. In England the same system gave rise to the copyhold tenures, in which the services, which abroad were indefinite and arbitrary and therefore oppressive, came gradually to be restricted by the courts to fixed amounts and periods. But early in the Plantagenet period there began to grow up a system of farming out land to tenants for fixed rents in money or kind. The records of certain manors show that this arrangement had become general by the middle of the 14th century. The statute book bears similar testimony. The pestilence known as the BLACK DEATH (*q.v.*) had about that period swept off half the labouring population, and the immense rise of wages which followed, and which the statutes of labourers (23 & 25 Edw. III. an. 1346-49) (see LABOUR STATUTES) were passed to repress, prove that there existed a large body of free labourers unconnected with any special lands, but ready to give their services to whatever masters offered the highest wages. Up to this time the food grains were the main objects of culture, but the growing of wool, for which England became specially famous, gradually took a leading place in husbandry. The consequence was that less labour was required in agriculture, and small farms were consolidated into large. The statute book shows that by the beginning of the reign of Henry VII. the depopulation caused by this system had advanced to a degree which endangered the safety of the realm. The statute 4 Hen. VII. c. 16 (1487) states that in the Isle of Wight the practice of landlords throwing small arable farms into large pastoral ones, in order to obtain the higher profits yielded by wool, had proceeded to such an extent that the population was seriously diminished, and the island left without adequate defence against an invader, and it was therefore ordained that no one tenant should hold a farm exceeding the value of ten marks a year, though tenants who might be thus evicted from possession were declared to be entitled to compensation for improvements they had made or buildings they had erected. Although this statute applied only to the Isle of Wight, as being the part of the realm most exposed to invasion, there is no doubt that the greater part of England was in the same economic position. The mischiefs arising from the consolidation of small arable farms into large sheepwalks were some of the most prominent popular grievances during the whole period of the Tudor dynasty.

In Scotland also, half a century earlier than the last cited statute, an act of parliament (1449, c. 18) was passed for assuring to tenant farmers (puir pepil that labouris the grund), holding under leases for definite terms, security against eviction by a purchaser of the land, which shows that this system of tenure must already have become general in that country.

This simultaneous rise of the practice in both North and South Britain excludes some explanations which otherwise might have appeared to account plausibly for its prevalence in place of the continental systems of cultivation by forced labour. The immunity of England from foreign invasion cannot be accepted as a reason, for Scotland was harried by incessant inroads of her English neighbours. Neither could the richness of English soil, and the wealth produced by exportation of corn and wool, explain the result, for Scotland was comparatively a

desert, and grew barely enough for her own consumption. But the one point of resemblance between the two countries was that in both most of the great owners of estates were of Norman descent, while the bulk of the labouring population was, in the lowland districts, Celtic-Saxon. To the proud and warlike Norman personal superintendence of agricultural operations was distasteful if not degrading, and he willingly assented to an arrangement by which the whole risk and trouble were devolved on a tenant, from whom he drew a fixed annual rent in produce or cash. On the side of the labourer, the sturdy Saxon independence preferred the payment of rent for an assured possession of what on that condition he could call his own to the rendering of personal services on his lord's domains. The idiosyncrasies of both races thus, under great divergencies of actual conditions, combined to establish the system of farming of land to tenants. In England land seems to have been from the first, as it still continues to be generally, let from year to year. In Scotland the caution of the race, or the extreme poverty of the soil, which refused its returns except to a long preliminary process of reclamation, made leases for long terms the rule. This we see was the case in the 15th century, and it continues in Scotland to this day. The customary length was nineteen years; it is not known why this particular number was adopted. Of late years the uncertainty of prices has tended to the adoption of shorter terms.

Under the system of farming land the landlord as a general rule places the land in a position for cultivation and supplies the necessary apparatus affixed to the soil. Thus he reclaims the land from waste, drains it, removes boulders, forms fences and roads, and in addition erects a dwelling-house for the tenant, as well as stables, barns, cattle-sheds, and all the other buildings requisite for stock and grain. The outlay demanded under these heads is of course variable, but in almost all cases it is very large, and probably in most cases equals or even exceeds, and often in a series of years greatly exceeds, the original fee-simple value of the land. In general also the landlord is at the expense of upholding all these improvements and structures. But these general rules are subject to occasional exceptions. Thus under the cottier system which formerly prevailed in Ireland, the tenant made the reclamations and erected the humble structures required for his habitation and stock. Not unfrequently, however, the landlord gave wood, stones, or slate to aid him. In Scotland a great deal of land has been reclaimed under what are known as "improving leases," these being for a duration varying between thirty and fifty years. During the first decade the tenant probably sits rent free—he will pay a small sum during the second, and a gradually-increasing one afterwards, under the condition that he brings the land under cultivation and erects suitable buildings on it. In this system the absence or smallness of rent is the consideration for the improvements, so that in this form they are paid for by the landlord.

After this expenditure of capital on the part of the owner of the land, the application of capital in the charges of cultivation is under the farming system made wholly by the tenant. The purposes to which it is applied are the purchase of horses and implements, of seed and manures, of live stock, and the payment of wages till returns come in. The amount invested by a tenant for these purposes varies between £5 and £15 per acre. Probably £7 or £8 is now an average, but all good farmers agree that it should not be less than £10. Under metayage most of this capital, except that required for wages, would be supplied by the landlord. Hence it appears that the farming of land has the effect of drawing in additional capital; it thus contributes to improved cultivation, while at the same time it tends to the maintenance of large estates. On the other hand a cultivator who has capital generally prefers to rent land instead of buying it, because as a tenant he obtains the use of his landlord's capital, which has been expended in the purchase of the soil, in draining and fencing, and in erection of buildings, and for all this the rent which he pays amounts to only a very low rate of interest. In this way the tendency is to promote the holding of large farms. In point of fact it is not till a tenant-farmer has made his fortune and intends to retire that he ever thinks of buying land; up to that time he usually invests his increase of capital in renting more land.

As a means of thus attracting capital to the cultivation of the soil the tenant-farming system has no doubt contributed materially to the fact that cultivation is on the whole better in Great Britain than in any other country; as, also, possession of capital implies comfort and some degree of education, it has elevated the position of the cultivators. The relation between landlord and tenant has in general been friendly and often accompanied with much personal regard. Nor, though really commercial in character, has it usually been conducted on strict legal rules. Landlords being often wealthy men have been easy in regard to the period of payment of rents, and liberal in accepting less than the full amount due when bad years occurred. Tenants, though holding only from year to year, have often retained the same farm for several generations, and in reliance on this usage have often expended a great deal of money in improvements which strictly belonged to the province of the owner of the soil. In Scotland, where leases in

writing and for definite terms are almost universal, this reliance on usage has not been the rule, and it has been common to submit each farm at the end of the lease to public competition. But even then many tenants have, at the cost of a moderate rise in rent—balanced frequently by the landlord executing further improvements—remained for life in the same holding; while in the exaction of the stipulated rent the same liberality, or laxity, has been shown as in England. Yet this very liberality has had a tendency to raise rents, since a sanguine man will offer more if he has some hope that in the event of losses he will not be severely pressed.

This easy-going arrangement went well on the whole not only in the periods of prosperity in the beginning of the present century, and again during 1850-70, but even during the agricultural depression which existed 1815-25, and again in 1833-40. When, however, a series of bad seasons set in from 1869, followed by severe falls in prices of corn dating from 1875, and of meat from 1884, all combined with a material rise in wages, some new influences were felt in the relation of landlord and tenant. A good many estates had changed hands, and the purchasers being generally commercial men, were inclined to take a strictly legal view of the liabilities of their tenants. Further, the extension of the franchise not only gave votes to the smaller tenants, but strengthened the general radical feeling in favour of tenants against landlords, and the Irish land legislation suggested some parallel changes in the laws of Great Britain. Under such motives the two successive AGRICULTURAL HOLDINGS ACTS (*q.v.*) were passed. But the social and personal effects of the depression have been much more vital. On nearly all estates very considerable changes of the tenantry have taken place. In a good many, leases or other written agreements have been introduced; a more commercial spirit has arisen; better agricultural education begins to make its way; more capital is invested alike on the landlord's and tenant's parts; and as a necessary consequence stricter calculations are made as to the profits and security of such investments. There is indeed an infinite variety in the degree in which such a spirit affects landlords and tenants; there are still many estates in which it is not felt at all, but such is undoubtedly the direction in which, with more or less rapidity, the mutual relations are moving.

One tolerably definite change may be said to be almost universally in progress. As a general rule it has been found that the largest holdings have felt the depression most severely, and that rents have been most regularly paid, and with least claim for reduction, on the smaller. One reason for this is that the smaller can be more closely superintended, another is that the tenant's capital consists partly of his own labour and that of his family, on which he does not expect full or at least regular payment of interest. Hence the process of consolidating small farms into large has been checked, and the reverse process of letting land in small farms or in allotments has made considerable way. The subdivision of large farms into small farms would undoubtedly proceed more rapidly were it not that it demands an outlay of landlords' capital in providing dwelling-houses and other buildings which the rents at present current would hardly repay. The same cause prevents any subdivision by tenants themselves. Where, as in Ireland, they erect their own buildings, and these are so inexpensive as to be within the means of an ordinary labourer, a tendency to subdivision among different members of the family at once develops itself, and is with difficulty kept within reasonable bounds by the landlord. No such tendency occurs where the outlay of capital required for such a purpose is considerable.

These considerations explain the rapid growth of "allotments," which, speaking generally, involve no outlay of capital in buildings, and the comparatively slow progress of "small holdings," which as a rule require erection of buildings and fences. The fact that cultivation on the small scale of allotments pays well, even at the present very low rate of prices, is shown by an important paper in the *Economic Journal* for March and June 1893 (see ALLOTMENT; SMALL HOLDINGS ACT).

The question whether farming is best conducted by leases for fixed periods, or by agreement from year to year, has been viewed differently in Scotland and in England. Strange as it seems, the latter has tended in practice to a more continuous possession by the same tenant and his descendants. On estates belonging to old families a tenant is seldom removed, and the rent is generally moderate. Thus cultivation proceeds on the assumption that there will be no disturbance, and this, if verified, is unquestionably the system on which the best farming can exist and the best returns be obtained. But where a fixed determination of the lease impends, and there is uncertainty of its renewal, the tenant takes as much out of the land as possible, and hence whoever succeeds him (or he himself, should he ultimately obtain a renewal) has to spend two or three years in bringing the farm again into condition. Some landlords have endeavoured to remedy this mischief by a clause in the lease declaring that it shall continue in force until three or more years' notice has been given. Leases for lives were at one time common, especially on estates belonging to corporations and in Ireland, but they combine the disadvantages of a certainty of expiry with an uncertainty of time, and hence are unfavourable to good culture. They are seldom now adopted.

Certain conditions or rules of rotation of crops

and other methods of culture used to be universally found in written leases or in estate regulations. They are necessary to prevent bad farming when either knowledge or inclination to adopt good farming is absent. But the advance of scientific knowledge and the general recognition that only good farming can pay has tended to make these rules to be less strictly insisted on, and even to disappear altogether.

RENT, whatever be its theoretical definition, is, in the practice of farming, the surplus of produce after paying the expenses of cultivation and interest on the tenant's capital. It is really fixed by the tenant, for although in England it may be nominally fixed by the landlord, yet it depends on the tenant's acceptance of the farm at such rate. In Scotland farms are almost universally let by tender, and therefore the rent is directly fixed by the tenant. The rate of interest which a tenant generally looks for on his own capital is 10 per cent, or it is often viewed as 5 per cent of interest and 5 per cent as remuneration for his personal exertions. The INCOME TAX Acts originally assumed that a tenant's profits in England were equal to half the rent and in Scotland to one-third of the rent, but the fall in rents (following on the fall in gross value of returns) has altered this proportion, and led to the adoption in England of the same proportion as in Scotland. In computing the profit to be retained by himself, a tenant does not in general include the rent of the dwelling-house and value of the farm produce (milk, potatoes, etc.) consumed in his own household, so that the actual interest he expects to make on his capital is nearer 12 than 10 per cent. This refers to the making of new bargains; with falling prices the actual profits have often been much less, or have disappeared. Rates and tithes, till the recent change in the Tithe Act, were in England generally paid by the tenant, in Scotland by the landlord—under recent legislation rates are divided between the two,—but in any case they form a deduction ultimately from the rent and not from tenants' profits.

The rent paid for farms is in the United Kingdom almost always in cash. In Scotland the practice long prevailed of paying in kind, *i.e.* the rent was fixed at so many "bolls" (four to six bushels) of the different grains grown in the district, commuted each year for money at the rates fixed as the FIARS PRICES. Some poultry were often added, known as "kain hens." This arrangement met equitably the case of fluctuations in prices, but not of fluctuations in crop; if the price rose in consequence of a bad crop the tenant whose crop was bad suffered, he had less to sell and more rent to pay; while with a large crop and low prices the landlord suffered by the fall of rent while the tenant, though his crop might be good, made no better profit. But when free trade rendered prices largely independent of the home crop, there ceased to be any compensatory influence at all, a low price might coincide with a bad crop; hence the system of rents computed in grain has almost entirely died out. A further reason for its cessation is that grain is now only a part of the produce, the production of meat having become a material source of revenue and the price of meat varying only within narrower limits; but, these variations occurring from market to market, its value could not be taken as any safe indication of the profits of the year. It may happen that store cattle are cheap while beef is dear, which gives good returns to the feeders while the rearer of young cattle is impoverished; or the reverse may occur and the breeder may make profits while the feeder buys so dear that he loses. These complications appear to render impracticable the suggestion which has sometimes been made recently that rents should vary in accordance with varying prices of produce.

Legislation has not very materially interfered with farming in Great Britain. In the Tudor period laws were enacted with the purpose of preventing the consolidation of small holdings and the laying down of land to grass. We have no definite record how far they proved effectual, but the fact of reiterated enactments and complaints seems to indicate that they did not attain their object. The influence of modern land legislation in Ireland and the Highlands of Scotland is yet hardly clear. In the rest of Scotland and in England the only compulsory enactments have been those giving compensation to tenants for the unexhausted value of manures and feeding stuffs, and giving to tenants the right to kill ground game. Neither have yielded much satisfaction to the parties concerned. The compensation is frequently more than balanced by claims made by the landlord for dilapidations or bad farming, which are quite legitimate but probably would not have been urged had there not been claims for compensation put forward by the tenant. If the Acts were more onerous than they have been found to be the result would have been that landlords would have refused to let farms, and have cultivated them by means of bailiffs. So also with regard to game, any compulsory provision is evaded by the tenant being made to understand that exercise of his legal rights will be followed by notice to quit. It is probably only the recent depression in agriculture—leading on the one hand to a difficulty in finding tenants at all, and on the other making existing tenants dependent on the kindness of the landlords—which has prevented these compulsory statutes from greatly diminishing the prevalence of the system of farming.

It is not easy to forecast the direction which farming may take in the future. The influence which developed it in the past,—the desire to

maintain large estates in land,—with all the social and political position which they implied, has in a great measure passed away, and more and more every year land is coming to be viewed and dealt with as a commercial commodity. The dominating question will therefore be whether land yields the best return to capital when cultivated by an owner or a tenant. The rent usually given by a tenant is little more than interest on buildings, drainage, and fences, so that he virtually gets the land for nothing. The position of tenant, therefore, with rents on their present basis, is undeniably an advantageous one. But the outlay of still more capital, both by the landlord in providing more ample farm-buildings and cottages, and by the tenant in paying the higher wages now required to keep labourers on the land, is urgently required. The good effects of both are conspicuous in Scotland and the Border counties of England, where higher rents (comparatively) are paid, the land is maintained in higher cultivation, labourers are more easily obtained, and being better fed, do more work for their wages. The misfortune is that many landlords or tenants do not possess the capital which would permit this course to be adopted.

Soc.*, 2nd series, vol. xxiii. p. 355.—J. Caird, *The Landed Interest*, 4th ed. 1880.] J. B. K.

FARM, OF THE COUNTIES. The revenue received by the crown in composition for its ancient claims on the land. The old payments in kind, *feorm-fultum* made to the king by the tenants of demesne lands, were commuted in Norman times for money rents (*Dialogus*, i. 8). These rents, together with the profits arising from the king's claims on the land, were termed collectively the *ferm*, or farm, of the county. The collection of this farm was usually entrusted to the sheriff or some other accountant, who was called the farmer, and was made absolutely responsible for the whole farm due to the crown. In some cases, however, the collector was called the *custos* or bailiff of the crown, and, as such, was only responsible for as much of the farm as he actually received. In the revenue rolls of the exchequer the farm includes the following items: (1) The *corpus comitatus* or rents, which remained the same from year to year and were charged with certain fixed payments; (2) The *remanens firmæ post terras datas*, or remainder of the farm, after the value of the lands granted away from the body of the county had been deducted; (3) The *crementum* or INCREMENTUM chiefly arising from new tracts of land being brought into cultivation; (4) The *proficuum*, including any profits arising from the king's territorial jurisdiction. There was formerly an important record preserved in the exchequer called the *Rotulus Exactorius*, which contained the details of all the farms of England as they appeared in the Pipe Rolls, and this list was posted up to date from Michaelmas to Michaelmas. This record, however, no longer exists. The *Red Book of the Exchequer* contains several lists of farms; and in the nearly related MS. Hargrave 313, a unique table is preserved of the farms of England as they appear in the Pipe Rolls from the year 1154 to the end of the reign of Henry III. In later times it was usual for the crown to grant fee-farms, or long leases of land at low rents, to corporations and others, who answered severally for the same as farmers. In this way also a large area of forest land was brought under cultivation before the reign of James I., but most of these *assart-rents* (see ESSART) were resumed by the crown in the reign of Charles I. A. E. S.

FARMING OF TAXES. The collection of revenue has always proved a problem to governments, especially in early times before the growth of efficient administrative machinery, or in states of very large extent. An obvious method of solving the problem has been to entrust the difficult and invidious task to private individuals or companies, who pay a fixed sum to the government and take any surplus they can make from the taxpayers as their own profits. The two states in which this system of farming the taxes has been most extensively adopted are ancient Rome and France under the old régime.

As the dominions of Rome grew, the privilege of extorting contributions from the provincials was sold by the censors for a period of years to PUBLICANI (*q.v.*), most of whom belonged to the equestrian order. Their profits were enormous, especially when Asia fell under Roman rule, and the equestrian capitalists became a very influential body in the state from the days of C. Gracchus. As the *publicani* had to give security to the state, and this was often beyond the wealth of any individual, it was usual for them to form associations among themselves and to share the profits. Sometimes a company only contracted for a particular branch of the revenue, sometimes it collected the whole payments of a particular province. A provincial governor could never have an interest in the companies of *publicani*, and this rule had the effect of excluding the senatorial class. The actual collection of the taxes was entrusted to subordinate agents.

In France it was only the indirect taxes which were farmed (see FARMER-GENERAL). The practice originated in the constant pressure of pecuniary needs upon the French government, which compelled it to anticipate its revenue.

and thus threw it into the hands of financiers. By the 18th century nearly all the taxes were farmed by a single company, the *ferme générale*. This consisted of sixty capitalists, who were nominated by the king, and were under the management of the controller-general. They paid a fixed sum for the right of collecting the *gabelle*, the *traites*, the *entrées de Paris*, and for managing the tobacco monopoly. The lease was made for six years, and the controller received a *pot de vin* of 300,000 francs, which was, however, refused by Turgot and Necker. The position of *fermier-général* was eagerly sought after, and the kings had always a long list of candidates for vacancies. The chief defects of the system arose from the tyranny of local agents, who were often ill paid, and from the action of the king. In appointing the *fermiers* he often saddled them with obligations to pay considerable sums to courtiers and favourites. These charges, called *croupes* and *pensions*, compelled the government to lease the taxes at a lower rate than would otherwise have been obtainable.

In England, the system of farming the revenue was adopted in Anglo-Saxon and Norman times, when the sheriffs paid a composition (*ferm* or *firma*), for the various dues which they had to collect from their shires. It was a great object of the towns to free themselves from the sheriff's control and to pay their contributions direct to the crown. The acquisition of this privilege, or *firma burgi*, marks the beginning of municipal independence. In the 12th century the collection of the DANEGELD (*q.v.*) was farmed by the government to the sheriffs, but after Henry II.'s reign the practice of farming the taxes gradually disappeared. This was due partly to royal jealousy of the power of the sheriffs, and partly to the rise of the new system of taxing personal property. R. L.

FARMING TAXES, PRINCIPLE OF. The system of letting out the collection of taxes to contractors at a fixed rent, as opposed to direct levy by state officials (REGIE, *q.v.*), marks a low stage of financial development. It is naturally employed where a skilled administrative staff has not been formed, and where private capitalists are ready to undertake the work. Farming has been in most cases limited to taxes on commodities—the Roman direct taxes were for a time an exception (Mommsen, *Hist. Rome*, vol. iii. p. 115)—and may be given either by delegating the collection of the tax, or bestowing a monopoly of the taxed product. The most conspicuous examples of this form of collection in ancient times are found in the Roman state, where powerful companies, *societates vectigales*, were formed for the purpose. France from the 16th to the 18th century is the chief modern instance (see FARMER GENERAL). Under the *ancien régime* the salt monopoly (GABELLE, *q.v.*), the *aides* or drink duties, and the tobacco monopoly were farmed out. At present the system is limited to cases in which taxation is raised through monopoly of the taxed article—as tobacco in Italy—or to indirect taxes for local purposes (OCTROI, *q.v.*).

The objections to farming taxes are weighty and easily perceived. Politically, it interposes a privileged body between the ruler and his subjects, and leads to the enactment of oppressive revenue laws, which are harshly applied (*Ubi publicanus est, ibi aut jus publicum vanum aut libertatem sociis nullam esse*, Livy, xlv. ch. 18). Economically, it reduces the income of the state by the profits—generally exorbitant—obtained by the farmers. The early financial theorists protested against its use. Montesquieu (*Esprit des Lois*, bk. xiii. chs. 19, 20), while admitting that it is "sometimes desirable to give new taxes in farm," strongly approves of direct collection by the state as good for both sovereign and subjects. Justi is still stronger, "the farmer is the leech of the people," *Natur und Wesen der Staaten*, p. 451, ed. 1771. Adam Smith declares that "the best and most frugal way of levying a tax can never be by farm"; the great capital required for farming the revenue practically excludes competition, which is replaced by combination, "even a bad sovereign feels more compassion for his people than can ever be expected from the farmers of his revenue"; the permanent interests of ruler and people are in harmony, while those of farmer and taxpayer are opposed (*Wealth of Nations*, bk. v. ch. ii. art. 4, ed. Nicholson, p. 383).

The intense hostility that the farmers of revenue excited both at Rome and in France supports these strictures (see PUBLICANI). Collection by public officials is the only proper course in a well-organised state. Farming is, however, admissible when the public economy is imperfect, and the chief source of revenue is from the domain. To entrust the collection of dues on commodities to persons whose self-interest will secure strict supervision, and whose profits will be but a part of the larger return obtained by their efforts, is under such conditions the most economical mode. Wide-spread official corruption may also justify the employment of farming, which, however, is plainly a transitional step to be superseded by means of deeper reforms.

[In addition to quotations in text, the leading German writers on *Finanzwissenschaft*, viz. Roscher, bk. ii. ch. vi. § 67, 2nd ed. 1886,—G. Cohn, § 385, 1889.—A. Wagner, vol. ii. pp. 746-752, 2nd ed. 1890), also Bastable, *Public Finance*, 1903, pp. 552-3, 742-3.] C. F. B.

FARR, WILLIAM (1808-1887). Born at Kenley, Shropshire, died in London. He was educated for the medical profession, but exchanged it to enter, in 1838, the department of the registrar-general of births, deaths, and marriages. His knowledge of statistical science, and lucid and original style of study and composition were early recognised by his

superiors in office; and, although he did not advance beyond the post of Deputy-Registrar-General, his talents and force of character made him, throughout his long public service, the most prominent man, in general estimation, of that section of the official hierarchy to which was confided not only the registration, study, and analysis of the three leading events in the lifetime of the population, but also the very important duties of the census enumerations. Dr. Farr's literary activity was very considerable, and was directed, with much earnestness and consistency, to the scientific analysis of subjects having a real practical bearing on social economy, sanitation, and the prevention of cholera and other specific diseases. Dr. Farr's contributions to the mathematical and statistical improvement of the theory of vital statistics and their tabulation were also important. Some were treatises from the medical, others from the mathematical or economical point of view, and all were remarkable for clear insight, and for novelty of conception. To Dr. Farr also belongs the credit of instituting a proper nosology, or classification according to diseases, of those dying at each age, and also of doing much to aid the labours of actuaries by the calculation of life tables based on reasonably accurate returns of the mortality according to the most modern facts revealed by the census enumerations of the whole population of England and Wales. His first essay on this subject dates from 1843, when he published his *English Life Table No. 1*, to be followed in 1853 by the *English Life Table No. 2*, and in 1864 by a more elaborate work, the *English Life Table No. 3* (often called Farr's Tables), which contains many tabulated values of annuities, and auxiliary tables for the calculation of all sorts of ordinary life contingencies, with an excellent introduction. The results are still largely used by actuaries when an approximation is desired to the most modern available experience of the duration of life amongst the general public of all classes in this country. Dr. Farr also wrote many able papers upon provident funds for widows and children of the civil servants of the state as a whole, and for single departments, such as the post-office. He was also partial to the study of centralising schemes, such as the purchase of railways by the state, government insurance of capital sums and survivorship annuities, and mutual cattle insurance associations for agriculturists. A vast number of reports on subjects more or less cognate with those above indicated were contributed by him to the various periodical publications and blue-books of the registrar-general and census commissioners, and to the transactions of English and foreign societies with which he was connected. It may be said with truth that no English statistician was ever before so cosmopolitan, or so appreciated abroad as Dr. Farr. His genuine goodness of disposition, as well as his scientific attainments, made him a *persona grata* at the many international statistical congresses held at London and on the Continent, which he punctually attended as one of the English delegates. The effectual manner in which he played a leading part in the organisation of the congress of which Prince Albert was the president in London is still an agreeable reminiscence with the one or two still surviving secretaries of sections. At the Royal Statistical Society Dr. Farr was equally esteemed. He took, for a long period of years, a great share in its management, contributed many valuable papers, and filled with credit the post of president from 1871 to 1873.

Some illustrations of the style and scope of Dr. Farr's views and conclusions respecting his work and his important studies in the domain of vital statistics, a subject with which his name and public services will long continue to be honourably associated, will be found in his book under that title, named below.

In 1885 the Sanitary Institute of Great Britain reprinted, under the editorship of Mr. Noel A. Humphreys, of the registrar-general's office, a selection from Dr. Farr's works above mentioned, in some instances in rather an abridged form. This was issued by subscription as a memorial volume under the title of *Vital Statistics*, London, 1885, 8vo, pp. xxiv + 563. It contains also an appreciative and interesting sketch of Dr. Farr's life, by Mr. Humphreys.

Among Dr. Farr's principal works are:—"Report upon the Mortality of Lunatics" (*Stat. Soc. Journal*, 1841).—"The Influence of Scarcities and of the High Prices of Wheat on the Mortality of the People of England" (*Stat. Soc. Journal*, 1846).—"Statistics of Civil Service of England, with Observations on Funds for Children and Orphans" (*Stat. Soc. Journal*, 1849).—"Influence of Elevation on Fatality of Cholera" (*Id.* 1852).—"Formules adoptées en Angleterre pour l'inscription des naissances," etc. (*Congrès Internat. de Stat.*, 1853).—*Report on Internat. Stat. Congress*, Paris, 1855.—*Report on Nomenclature and Stat. Classification of Diseases*, 1856.—*Report on Internat. Stat. Congress of Vienna*, 1857.—"On the Pay of Ministers of the Crown," *Stat. Soc. Journal*, 1857.—*Rapport sur la statistique de la G. Bretagne*, 1858.—*Tables relative to the state of the British Army in Russia*, 1854-56, published 1859.—*Reports on the Vienna Int. Stat. Congress*, 1861.—"Recent Improvements in Health of Brit. Army" (*Brit. Assoc.*, 1861).—*English Life Table No. 3*, large 8vo, clv. + 605 pp., London, 1864.—"Address as President of Section F" (*Brit. Assoc.*, Bath, 1864).—"On Infant Mortality" (*Stat. Soc. Journal*, 1865).—"Mortality of Children in Principal States of Europe" (*Id.*, 1866).—"Statistik von Gross Britannien' (*Congrès Intern. de Stat.*, 1865)—"Statistique de la Grande Bretagne" (*Id.* 1867-69).—"International Coinage" (*Brit. Assoc.*, 1869).—"On the Question of

Metric Weights and Measures" (*Intern. Stat. Congress*, 1870). —"Inaugural Addresses as President of the Stat. Soc. 1871 and 1872.—"On the Valuation of Railways, Telegraphs," etc. (*Stat. Soc. Journal*, 1876).—"Étude sur la mortalité en Angleterre" (*Annales de démographie*, 1877).—"Some Doctrines of Population" (*Brit. Assoc.*, 1877).—"Éloge de Samuel Brown" (*Congrès Intern. de Stat.*, 1878), [cf. art. on Farr by Prof. V. John in *Handwörterb. der Staatswissenschaften.*] F. H.

FARTHING. Originally the name given to the fourth part of a silver penny (fourth-ing). First struck as a separate coin in reign of Henry I. The coinage of silver farthings was continued until the reign of Queen Mary. Copper farthings were introduced in 1613 during the reign of James I., and were coined until 1860, when the present bronze coinage was adopted. The bronze farthing weighs 43·75 grains, and is legal tender to the amount of one shilling. F. E. A.

FASHION, ECONOMIC INFLUENCE OF. Fashion, when taken in its more general sense as the mode in which a civilised society is satisfying its various wants, or more specifically that of dress, conveys the idea of a more or less incessant tendency to *change*. The French recognise this quality of variableness with greater emphasis than the English, *mode* being defined by them as taste that is essentially mobile and transient. For us fashion is current usage; for them "usage is long fashion." Fashion cannot claim to include all such changes in habits and modes of life as are due to fresh discoveries and improvements in taste and comfort as such, or are consequent on change in physical or social environment. These may all involve corresponding changes in fashion, but when eliminated they will leave a residuum of variableness in wants not accounted for, but which, together with the complementary fact of a general conformity to that variableness, make up the phenomenon of fashion properly so called. For the economist it is one of the causes producing disturbing fluctuations in demand and supply, and therefore requiring "a more careful investigation than those causes whose action is more constant and more undeviating" (H. Fawcett, *A Manual of Political Economy*, 1876, p. 84). Under present economic conditions fashion, or any given fashion, comes to be both for consumer and purveyor an element on the one hand of complication, on the other of simplification. The field for the selective play of the consumer's choice is so great that purveyance is rendered very speculative. On the other hand, where his choice settles, demand is certain, at least for a brief period, to be both prompt and extensive, though of uncertain duration. "Changes of fashion are often due to the steady deterioration in the quality of articles which sets in the moment they become open to the fierce and unscrupulous competition of the market" (Foxwell, *Irregularity of Employment*, p. 69).

Fashion in Consumption.—In this connection the economic historian has to trace how "custom in wants, locally homogeneous and temporarily stable, has become fashion distributed in space and transient in time" (V. Schäffle, *Das gesellschaftliche System der menschlichen Wirthschaft*, Tübingen, 1873, pt. iii. sect. iii. The phenomenon of fashion, rooted as it is in elemental instincts and tendencies, is absent from no society or social epoch. "Every epoch has colours and contours which it prefers, forms which it affects, symbols which it venerates" (H. Havard, *L'art à travers les mœurs*, Paris, 1884), ebullitions of sentiment, whims, and fantasies to indulge in. Every nation, while it differs from others in geographical conditions, in political and social constitution, has also its own passing ideas to express. Every individual modifies this sentiment of the day according to his own individuality. The *essential* elements of fashion are present in all societies (cp. Darwin, *Descent of Man*, II., p. 383; Westermarck, *The History of Human Marriage*, London, 1891, pp. 165-186 and 274).

As an element in present-day consumption of wealth, fashion may be ranked, not so much as a class of wants under either necessaries, comforts, or luxuries, but rather as a co-efficient of any of these, a want *in* wants, *i.e.* a factor affecting a want already categorised under one of these three heads. Thus it may enter even into necessaries, there being no one commodity, unless pure air and pure water be considered as relative exceptions, which admits of being produced in one *mode* only. The essential elements in food may be taken in a variety of products, some of which, such as "Vienna bread," may be sold at a "satiety price" and yet be fairly viewed as a fashionable taste. In comforts, and still more in luxuries, fashion is a co-efficient of higher power. There is more scope for change because there is a wider field for choice. Fashion in such wants has been ranked as one of the four principles of luxury (Baudrillart, *Histoire du Luxe*, Paris, 1878, i. p. 7 *et seq.*), and as the outcome expressed in unreal needs of refined sensuality, opinion, or caprice (J. B. Say, *Traité d'Économie Politique*, Paris, 1841, bk. iii. ch. iv.). At the same time it has been claimed for fashion, and by the same national temperament, that love of change and mobility of taste, of which fashion is an apparently inevitable expression, constitute the mighty incentive or *primum mobile* of all progress, and if wisely cultivated, would banish *ennui* and social strife (Baudrillart, *op. cit.* i. p. 10; Fourier, *Le Nouveau Monde Industriel*, Paris, 1845, § 1, notices 1 and 2 on "La Passion Papillonne"). Berkeley expresses the same idea in the *Querist* (Query 20) when he asks "whether the creating of wants be not the likeliest way to produce industry in a people?" (Nos. 10-14, 18, 102, 140, 141, 144, 406, may also be consulted.)

As a want in wants, fashion may be considered as influencing—(*a*) the quality (or kinds) of wealth consumed; (*b*) the relative quantities of the different kinds of wealth consumed; (*c*) the rapidity of consumption.

(*a*) As expressing desire for change, as well as for distinction, fashion will prompt to departures in the direction of *contrast*. Changes in dress abound with illustrations of this tendency. Further, as an expression of the effort after social equalisation, fashion, in diffusing itself outwards and downwards, involves deterioration in quality through adulteration, reproduction in coarser material, and more coarsely finished production. When every woman wishes to wear silk, cotton admixture is lavishly used, even in a proportion of 9 to 1. Again, as expressing the drift of some epochal idea, fashion selects some class of materials, forms, and colours in preference to others; deserting, for instance, the perukes, powder, and the gay hues of a courtly, conventional, and aristocratic *régime* for the simpler modes of a phase of social upheaval and democratic ideals.

(*b*) Thus also fashion affects the relative quantities of goods in demand. Ribbon is always to some extent in request, but consumed in far greater quantities when fashionable wear. Further illustration is needless.

(*c*) In enumerating the causes governing the rate at which wealth is consumed, Storch distinguished, beside nature and use, opinion, which destroys the value of wealth independently of matter (*Cours d'économie politique*, St. Petersburg, 1815, IV. vii. cp. I.). This truth, expressed more picturesquely by Shakspeare, "the fashion wears out more apparel than the man," is dealt with by some economists, notably by J. B. Say, who asserts that fashion, by its privilege of condemning what is still fresh, and perhaps comfortable and pretty as well, as worthless, impoverishes the state both in what it consumes and in what it does not consume,—an epigram limited in application through the redistribution and prolonged consumption of whilom fashionable goods in the second-hand trade. Nevertheless the effect of fashion on very many is to throw a glamour over certain products irrespective of beauty, convenience or fitness, and which, as it fades, causes the same product to be the more hastily superseded in proportion as those qualities are absent.

These constitute to a greater or less extent limitations to the nature and rapidity of changes in fashion. Beauty and fitness combined may limit the mode of dress in one age and climate to draping and swathing the body, in another to close-fitting raiment. Hygienic principles, where accepted, proscribe some tastes potentially or actually in fashion. The love of comfort and convenience may, and in Germany does, tend to diminish the love of change in fashion (*vide* Carl Junghans, *Der Fortschritt des Zollvereins*, Leipzig, 1848, pp. 27-58). Economy may either prolong or proscribe a mode. Custom and routine, whether or not coinciding with convenience, may greatly circumscribe change, as in uniforms and special "costumes." Finally philanthropy and patriotism, morality and religion, have all been brought to bear as regulative principles on excessive instability or wantonness in tastes. Fashion on the other hand has often rendered such principles yeoman's service by investing them, as *their* coefficient, with a constraining power exceeding that conferred by reason.

Viewed from the standpoint of the budget, changes of fashion, increasing some values and lowering others, have been considered as cancelling each other in the national income (Roscher, *Principles of Political Economy*, New York, 1878, § ccviii.). Modern production, on the "mass-pattern," and "ready-made" system renders it cheapest to buy what is in fashion. Yet Locke struck the true key-note when he wrote, "Things of fashion will be had, . . . whatever rates they cost, and the rather because they are dear" (*Some Considerations of the Consequences of the Lowering of Interest*, etc. 1692, pp. 93, 94; and H. S. Foxwell, *Irregularity of Employment*, etc., 1886, pp. 36, 37; cp. also a contrast in this respect alleged between French and German ladies, Junghans, *op. cit.*, pp. 57, 58).

Fashion in Production and Distribution.—The anxious purveyor to fashionable whims is as ancient a figure in history as fashion itself (cp. *e.g.* Plautus, *Epidicus*, ii. 2; *Aulularia*, iii. 10). Were the record of industrial and commercial statistics of longer standing, there might be many such instances preserved as that in the *Limburger Chronik*, which describes in A.D. 1380 the failure year by year of tailors who competed unsuccessfully in ministering to the swift changes of fashion. As affecting modern trade and industry, fashion is now considered, not merely under the special question of overproduction or "gluts," but in connection with the more generic subject of trade risks, fluctuations of industry, or variations in production. The great expansion of variableness in demand has involved the extension of principles once governing the production of articles of luxury only, to all forms and modes of supply. More or less, every maker and every purveyor, even of necessaries, has now to study both to supply what people want and to win them to want what he supplies. Like everything else in the struggle for life, success, *i.e.* survival, is a feat of adjustment in midst of fluctuating conditions. Failure is the result of miscalculation, of maladjustment.

Even owners and cultivators of land are not exempt from this species of risk. Viticulture, sericulture, the cultivation of the finer sorts of

garden produce, and the conducting of ostrich farms, are liable to be affected by changes in fashion. The value *e.g.* of the ostrich feathers imported into this country had declined between 1880 and 1889 in the proportion of 5 : 2 ; the weight in that of $2\frac{1}{2}$: 2.

In the tactics of the manufacturer the symptoms (1) of indecision in vacillating demand raise the problem : What can I "bring out" to attract ? (2) of a favourable turn : How long will it last ? What can I do to get, or keep, ahead in the race ? Can I devise developments ? (3) of a recoil : Can I turn out what is now in demand with such plant, machinery, and hands as I have ? In such an attitude he has to confront demand with its co-efficient fashion, and armed with "money, wits, and perseverance," compass the capture of the lucky *conjunctur.* "Wits" he partly embodies in superiority of machinery, of designing, *i.e.* in the faculty of taking a lead in designs that "sell," of dyeing and finishing, and finally in that fine commercial *flair* which leads to "hits" rather than to "misses." By it he lays his hand upon the pulse of taste, and, divining the symptoms, is able in some degree to eliminate from his business that "aleatory" element which dominates else the amount of his reward (cp. Leroy Beaulieu, *La Répartition des Richesses*, pp. 299, 302). The importance of such augury was expressly admitted by a Lyonnese manufacturer (*v.* "Report by Mr. Dyce to the Board of Trade on Foreign Schools of Design," 1840, cp. *Edinburgh Review*, vol. xc. 1849, p. 481). "That something, which in the world of fashion is only an indefinite sentiment, in fact, a mere predisposition, we endeavour to render palpable, to give it a strongly-pronounced character and assign it a name. Therefore it is that with us fashion is so paramount : the objects of industry, the commencement of a season, exactly chime in with, and anticipate, the predispositions of society." Others who are content to follow rather than lead fashions, watch the inception of a taste, estimate the rate of its diffusion, and anticipate its final stage in mass-production. Exact estimates of the effect of fashion on the career of an industrial centre or firm are complicated for *entrepreneurs* as well as for laymen, by demand being a plurality of effects, and by the "intermixture of causes" in trade fluctuations. Of nineteen merchants and manufacturers who gave evidence before the Commission of Inquiry into the Depression of Trade and Industry, 1886—an inquiry which negatively absolved fashion as a cause of that specific depression—one (a German in Scotland) stated that adaptation to demand and avoiding large stocks were sufficient to meet changes. Another confirmed this, the adjustment being possible "in the great majority of cases" without change of machinery, an exception being the recent preference of worsteds (combed yarns or "serges," etc.) to woollens (carded yarns or cloth). All, in one way or another, while not clearly distinguishing between the grounds of change in taste, admitted that such changes, especially in the silk and lace trades, were "one of the greatest difficulties" they had to contend with, and had occurred, perhaps, with greater frequency and rapidity in late years. Bradford, Paisley, and Coventry in Great Britain, St. Etienne and Lyons in France, may be cited from a long list of centres, the industrial careers of which have experienced fluctuations peculiarly aggravated, if not created, by changes of fashion. In the words of a Yorkshire mill-owner, "in the crinoline days Bradford dress goods from English wools were in great demand. When ladies preferred clinging fabrics (cashmeres, etc.) the advantage went to the 'soft goods' of France, which now are largely made in Bradford. When mohairs and alpacas were in fashion, Bradford, by its yarns, got the advantage. When braids are fashionable, Bradford benefits. When calico prints were much in fashion, Bradford suffered ; on the other hand it obtained advantage from the demand for *mousselines de laine.*" If these and other towns and firms are to-day surviving in the fight, it is in consequence of adjustment to new tastes and of substituting many-sidedness for over-concentration. As the demand for the pseudo-Indian or Paisley shawl died out, which till about 1850 gave occupation to one-third of the Paisley town population, several industries —thread, starch, engineering, shipbuilding— were developed instead. "Trade is on a broader basis and less liable to severe fluctuations." Coventry has ceased to concentrate itself on ribbons, and realised locally unprecedented fortunes in cycles, besides developing other trades. Lister's spin thread when plush and velvet is "sluggish," and with superlative machinery, skill, and invention, weather every storm, even the blast of McKinley tariffs.

Adjustment to, and creation of, new demand in the business of the modern "purveyor" is in conformity to the democratic nature of to-day's fashions. Dress, for instance, was at one time imposed from above. Now the sovereign people's tastes have to be besieged simultaneously and *en bloc* by the shop-window, the stage, the park and race-course, by advertisement, daily paper, and fashion journal—this last organ coming to birth with the French Revolution. Royalty can only suggest, not lead, the fashion. Just as the highest class of dressmakers will equip their customers completely, so the modern "Grands Magasins" cater for the million from head to foot. And always rigidity is avoided by the purchase of lighter stocks, smaller quantities.

The interests of the wage-earner are affected

by fashion in a precisely parallel manner. New demands, if within the range of his skill, mean more work. Rigidity, whether by over-specialisation, want of technical versatility, or any accidents of combination, is fraught with danger. When the ribbon trade was slack at St. Etienne the workmen were reported to be in the habit of getting taken on in the other industries of that centre (*v.* M. de Lanessan's Report; Depression of Trade Commissioners' Report, 1886). The Coventry ribbon weavers with domestic looms fared very badly, especially after the French treaty (1860). Fashion was more responsible for the poverty occasioned by the decay of the Irish cottage industry of embroidery muslin (*Journal Statist. Soc.*, xxiv. 515-517, cp. De Laveleye, *Le Luxe*, Verviers, 1887, p. 70). A sudden cessation of employment is not alone disastrous, a slowly-decaying industry bringing with it degradation in skill and reduced wages. "East-End" industries, such as artificial flower-making, trimmings, *e.g.* fringes, etc., and fur-sewing, especially where there is no alternative occupation, suffer more sudden fluctuations, the London season—a political quantity with a co-efficient of fashion—greatly aggravating the precariousness of maintenance (*v.* Miss Collet on "Women's Work" in Booth's *Life and Labour*. See also CUSTOM; DEMAND; HABIT).

[Beside the works referred to, there are brief allusions to the effects of fashion in Cantillon, *Essai sur la Nature du Commerce*, 1755, ch. xiv., xv.—Malthus, *Essay on Population*, bk. iii. c. 13.—M'Culloch, *Principles of Political Economy*.—H. Sidgwick, *Principles of Political Economy*, bks. i. ch. iv. and ii. ch. 11.—Walker, *The Wages Question*, ch. xi.—A. FATHERS, THE; THEIR ECONOMIC TEACHING AND INFLUENCE. The history of Christian teaching, as expressed by the Fathers, concerning material goods and the proper conduct of life in relation to them, falls into three periods—(1) that of the Primitive Church; (2) that of the third century; (3) that of Post-Constantinian times.

(1) The church of the first two centuries was marked by a fraternal sympathy in face of the hostile world, and by a belief in the approaching end of the dispensation. Accordingly there was a liberality of charity among its members which amounted almost to a common enjoyment of possessions, so that Tertullian (160-240) boasted, "We Christians have all things in common except wives"; and earthly possessions were treated with indifference except so far as they contributed to actual sustenance. It was scarcely necessary to enforce the duty of almsgiving; but, when it was referred to, the rule was laid down that relief should be given to every suppliant. Clement of Alexandria (*d.* 220) warns his readers not to attempt to discriminate; "for by being fastidious and setting thyself to try who are fit for thy benevolence and who not, it is possible thou mayest neglect some who are the friends of God." But as this charity was practically restricted to the necessary relief of the brethren, whose desert was sufficiently guaranteed by their avowal of Christianity, it could hardly have had any baneful effects. Moreover the Christian teachers constantly exhorted their followers to labour industriously at their several callings, that they "might have enough for themselves and for the poor, and not be a burden to the church"; and this attitude towards labour certainly helped to remove the stigma which the institution of slavery had put upon it. Wealth was recognised as a gift of God to be rightly employed. Tertullian explained that the Christians were "no Brahmans or Indian gymnosophists, no wild men of the woods, and separatists from life"; and it was only among Gnostics and some of the Judæo-Christian communities that there was any rejection on principle of private property.

(2) The ascetic Montanist movement at the end of the 2nd and beginning of the 3rd century, though itself unsuccessful, seems to have affected Christian thought by suggesting a "double ethic,"—the idea of the diverse duties of perfect and of ordinary Christians. Renunciation of earthly property became with Origen (185-253), and S. Cyprian (200-258), a counsel of perfection in the same way as celibacy. Almsgiving, also, was spoken of by the writers of the period as itself sin-atoning; and the treatise of Cyprian *On Good Works and Alms* had great influence on the subsequent doctrine and practice of the church.

(3) The situation in the post-Constantinian period was fundamentally changed by the adoption of Christianity as the state religion. The church now included multitudes whose moral standard was low, and with deepening distress among the poorer part of the population the sphere of its duties became more extensive.

Accordingly increasing stress needed to be laid on the duty of almsgiving; and to overcome the reluctance of their hearers, the great preachers—such as among the Greeks, S. Basil (329-379) and S. Chrysostom (347-407); among the Latins, S. Ambrose (340-397) and S. Augustine (354-430)—were led to use extremely forcible language as to the wrongfulness of a selfish use of wealth. Thus S. Basil, in a frequently quoted passage, puts into the mouth of the hard-hearted the question, "Whom do I injure, if I keep what is my own?" and replies, "Tell me then what is thine own? Whence didst thou obtain it, and bring it into the world? The rich are just like one who has taken his place in the theatre, and crowds all who come in later, as if the playhouse, which is for all, were for him only. For they first take possession for themselves alone of what is common to all, and then lay claim to it as property, because they obtained it first. If each would only take as much as he needs to satisfy his necessary requirements, where then would be the rich, and where the poor?" Expressions almost verbally identical, and apparently calling in question the rights of property, fell also from S. Ambrose. But such language is to be explained, partly as rhetorical exaggeration; partly as due to the idea that voluntary surrender of property was the duty of every Christian who would be perfect; and partly as due to another idea which now made its appearance—that the natural and original order was one of communism, and that private property first arose from sin. But this original order Christians were to aim at restoring only by self-abnegation; and the Fathers did not intend to imply, nor were they understood to imply, that the compulsory abolition of private property would be justifiable. The case is parallel with that of slavery. Slavery also was held by the Fathers to be a departure from natural equality produced by sin. But though the Fathers regarded manumission as a work well-pleasing to God, and endeavoured to mitigate the lot of the slave, they never attacked slavery as an institution. Similarly S. Chrysostom describes the happy society which would be constituted if all the Christians in Constantinople would only agree to live in common; but he meant by this rather a distant ideal than a practical proposal.

It is clear, however, that the duty of giving all one had to the poor *was* taught as a means of perfection; and that this teaching, while it led to much noble self-sacrifice, led also to an indiscriminate distribution of doles, which must have had a pauperising effect. A more excellent way of charity was taken by the establishment of hospitals for the sick, which made their first appearance in the 4th century.

The contempt for earthly goods, pushed frequently to the point of asceticism, had already led some of the Fathers, such as Tertullian and S. Jerome, to condemn trade,—especially foreign trade; and even S. Augustine spoke of trade as itself evil since it turned men from seeking God. Teaching such as this encouraged the early anchorite and monastic movements. But the more sober judgment of the church, as expressed by Leo the Great (390-461), held that trade was good or bad according to the way in which it was carried on. The conditions on which trade was justifiable were as yet hardly analysed; but the idea that buyer and seller should abide by the "just price" of every commodity had even thus early made its appearance (see JUSTUM PRETIUM).

Of more immediate effect was the teaching of the Fathers who with one voice reprobated the taking of usury, *i.e.* of all payment for the use of money. It is abundantly clear that the Fathers themselves condemned the practice absolutely,—whether the payment was small or great, and whether it was taken from rich or poor. But it is almost equally clear that, although borrowing for the purpose of business investment was not at all unknown, loans were far more commonly contracted by the poor to help them through seasons of distress; and it was in their character as the administrators of charity that the problem was brought before the rulers of the church. Thus Pope Gregory the Great (544-604) felt himself obliged on more than one occasion to make advances without interest out of church funds to farmers who were constrained to pay their taxes before selling their crops, and were having recourse to usurers. The Council of Nicæa (325) forbad the practice of usury to the clergy; and it was doubtless due to the influence of the church that the Code of Justinian (529) limited the rates of interest which could lawfully be taken by laymen.

Christian teaching had, however, a wide economic influence outside its bearing on the personal employment of wealth. This is seen in its condemnation of infanticide; its suppression of the gladiatorial shows; its consecration of Sundays and festivals as days of rest; and above all in its effect upon slavery. Mr. Lecky has thus summed it up, "Christianity supplied a new order of relations in which the distinction of classes was unknown. It imparted a moral dignity to the servile classes; and it gave an unexampled impetus to the movement of enfranchisement." In all these ways it contributed immeasurably to the gradual elevation by which slavery slowly passed into mediæval serfdom.

[The above is based chiefly on the excellent work of Gerhard Uhlhorn, *Christian Charity in the Ancient Church*, Eng. trans. 1883, especially bk. ii. chs. ii. vi.; bk. iii. ch. iii.—Lecky, *History of European Morals*, 1869, ch. iv. gives an impressive account of the practical consequences

of Christian teaching, especially in relation to slavery; and Milman's chapter on "Christian Jurisprudence," in vol. i. of his *History of Latin Christianity*, 1854, should also be consulted.—F. X. Funk, *Geschichte des kirchlichen Zinsverbotes*, 1876, furnishes the best statement of the views of the Fathers on usury. The very suggestive criticism of the economic ideas of the Fathers in K. Knies, *Politische Oekonomie vom geschichtlichen Standpunkte*, 1853 (2nd ed. 1883, pp. 113-120) is the source of most of the later expressions of opinion on the subject by professed economists.]

W. J. A.

FAUCHER, Julius (1820-1878) was descended from French Huguenot exiles. He studied philosophy at Berlin, and there resided during the greater part of his life. As a journalist, lecturer, publicist, politician, and delegate in different capacities, he impressed himself upon his age mainly as an opponent of protection and collectivism. In 1846 he founded the first free-trade association at Berlin with Prince Smith, E. Wiss, and others. When the paper he edited was suppressed, he joined the staff of the *Morning Star* in London, and became Cobden's secretary. In 1863 he founded, and for fourteen years edited, the Liberal economic journal entitled the *Vierteljahrschrift für Volkswirthschaft und Kulturgeschichte*. He laboured also for the unification of fiscal and commercial legislation in Germany, and founded for the promotion of inland navigation the *Verein für Fluss- und Kanal-schifffahrt*.

He wrote (*a*) separate works, *Die Vereinigung von Sparkasse und Hypothekenbank, und der Anschluss eines Häuserbauvereins als socialökonomische Aufgabe unserer Zeit, insbesondere der Bestrebungen für das Wohl der arbeitenden Klassen*, Berlin, 1845, 8vo.—*In der Bankfrage gegen Gustav Julius*, Berlin, 1846, 8vo.—*The Russian Agrarian Legislation of 1861* (being No. 7 of the "Systems of Land Tenure in Different Countries," published under the sanction of the Cobden Club), London, 1870, 8vo.—*Ein Winter in Italien*, etc., Magdeburg, 1876, 8vo.—*Vergleichende Culturbilder aus den vier europäischen Millionenstädten*, Hannover, 1877, 8vo.—*Streifzüge durch die Küsten und Inseln des Archipels, und des ionischen Meeres*, Berlin, 1878, 8vo.—(*b*) Articles in the *Vierteljahrschrift:* 1863—"Die Baumwollennoth," "Staats- und Kommunal-budgets," "Geschichte, Statistik und Volkswirthschaft," "Zur Frage der besten Heeresverfassung." 1864—"Oesterreich und die Handelsfreiheit." 1865—"Die Bewegung für Wohnungsreform" (pt. ii. 1866). 1866—"Sachsen am Scheidewege." 1867—"Die zehnte Gruppe auf der Pariser Ausstellung" (workmen's dwellings), "Die Hypothekennoth in Norddeutschland." 1868—"Währung und Preise." 1869—"Vom Wegezoll und seinem möglichen Ersatze," "Ueber Hausbau-Unternehmung im Geiste der Zeit," "Gedanken über die Herkunft der Sprache" (continued in subsequent numbers). 1871—"Auf kosmopolitischer Fahrt." 1874—"Ueber die wirthschaftliche Zukunft des osmanischen Reiches," "Ein Rückblick auf die Geschichte des lebenden Geschlechts aus örtlichen und persönlichen Perspektiven." 1875—"Kurze Wechselziele zur Vorbeugung der Handelskrisen," "Die handelspolitische Grenzzollfrage vor dem 16ten Kongresse der deutschen Volkswirthe in München," "Die handelspolitische Grenzzollfrage vor dem deutschen Reichstage," "Die warnende Dynamit explosion in Bremerhaven." 1876—"Der Plan einer Erwerbung sämtlicher Eisenbahnen in Deutschland durch das Reich."

C. A. F.

FAUCHER, Léon (1803-1854), born at Limoges, died at Paris. A man of action rather than a thinker, at once a politician and an economist, he led a varied life. His first occupation was that of a teacher in the humblest sphere, but his essentially energetic temperament soon drew him into more active pursuits. The revolution of 1830 had scarcely terminated before he joined the *Temps*, a paper belonging to Jacques Coste, and he remained working on it, side by side with Dussard, up to 1833. He then joined the *Constitutionnel*, and also worked on the *Bien public*, a short-lived journal, and finally, in 1834, on the *Courrier Français*, of which he became chief editor in 1839. It was at this time that he published his work *De la réforme des prisons*, 8vo, 1838, and soon afterwards *L'Union du midi*, which, to checkmate the German Zollverein, proposed a customs association between France, Belgium, Switzerland, and Spain, 1837-1842, in 8vo. Faucher was, after 1834, a constant contributor to the *Revue des deux mondes;* his sober and exact style, contrasting with his impulsive ideas, rendered him popular with the readers of that journal. He read, in 1843, his *Recherches sur l'or et sur l'argent* before the Academy of moral and political sciences, and entered it in 1849. Meanwhile he commenced publishing, in 1845, his *Études sur l'Angleterre*, 2 vols. 8vo, a very interesting work which, though now of course out of date, may still be read with pleasure. The city of Reims elected him, in 1846, to a seat in the chamber of deputies, where he urged, but in vain, the issue by the bank of France and the departmental banks of notes of 100 francs (£4), a step in the direction of progress which was not taken till 1848. Meanwhile Faucher turned with increasing force towards those occupations for which he had a special taste. He was one of the most active movers in the free-trade campaign in France of 1846-47—which was itself a preparation for the campaign against socialism. Two works of his, *Du système de Louis Blanc, ou le travail, l'association, et l'impôt*, 1 vol. 16mo, and *Du droit au travail*, 1 vol. 8vo, testify to his labours in this direction. He became a representative of the people successively at the constituent and legislative assemblies. After this time politics, and for a moment, during the period of transition, finance, absorbed him. He discussed questions con-

nected with the budget and the income-tax, which last he opposed. Unfortunately also he gradually gave up economics for politics. Thus, in November 1849 he opposed the abolition of the law for the restriction of combinations among workmen, and in June 1851 he abstained from voting on Sainte-Beuve's resolution in favour of commercial liberty. On the 20th December 1848 the president of the republic placed in his hands the portfolio of public works, an office which he exchanged, the 29th of the same month, for the ministry of the interior. His unwonted intervention in the elections compelled him to quit office after a stormy sitting of the assembly, in which he defended a bad cause with a courage worthy of better things. He was intrusted again, on the 16th April 1851, with the office of minister of the interior only to be deprived of it on the 26th October following. His bias towards absolute government had led the man who was seeking power to imagine that he would find in Léon Faucher a useful ally in the government which arose after the *coup d'état* of the 2nd December. But Léon Faucher, when appointed on the consultative commissions which the prince-president joined in the character of a protector, entered his protest against him with a rather noisy indignation, and then retired into private life, devoting himself to economic work in the *Revue des deux mondes*, the *Journal des économistes*, and other similar publications. If something was wanting in Léon Faucher's character, his honourable disinterestedness was at all events highly appreciated by all parties. A. C. F.

FAUQUIER, FRANCIS (1704 ?-1768), author of *An Essay on Ways and Means of raising money for the support of the present war without increasing the public debts*, 1756, was Lieutenant-Governor of Virginia from 1758 to 1768, and in that capacity is said to have written to Mr. Pitt about 1760 warning him against a project of taxing the colonies.

His *Essay* maintains that the poor cannot themselves pay any tax, since taxes levied from them necessarily raise the price of labour, and thus ultimately fall on the consumer, or "man of fortune who lives on his income." To the "consumer," therefore, the best tax would be that which is subject to the fewest deductions before reaching the exchequer, and this, Fauquier thought, would be a tax on houses roughly proportioned to their value. To the 2nd edition, 1756, he added a postscript in which he declared that his only object was to recommend the plan of raising sufficient revenue to meet expenses instead of contracting debt, and proposed a graduated capitation tax as a possible substitute for the house tax (see DECKER).

[*Dictionary of National Biography*, vol. xviii. p. 249.] E. C.

FAVOURED, MOST, NATION CLAUSE. See MOST FAVOURED NATION CLAUSE.

FAVRE, ANTOINE, also FABER and FAURE (1587-1624), chief president of the senate of Savoy, the father of the French grammarian Vaugelas, and friend of St. Francis of Sales, was one of the most distinguished writers of his time on Roman law and jurisprudence.

Besides other miscellaneous writings, such as a tragedy (*Les Gordiens*), and sacred poetry, he wrote a short treatise, *De variis nummariorum debitorum solutionibus* (Lyons, 1598, and Nürnberg, 1622), which, according to Michaud's *Biographie Universelle*, was directed against the more liberal views of Dumoulin (MOLINAEUS, *q.v.*) on usury and interest. E. Ca.

FAWCETT, HENRY (1833-1884), was born at Salisbury, and died at Cambridge. He was educated at King's College School and at Cambridge, where he migrated from Peterhouse to Trinity Hall. He graduated seventh wrangler in 1856, and was elected to a fellowship at Trinity Hall in the same year. In 1858 he was suddenly deprived of his eyesight by an accidental shot from his father's gun, but the infliction of this, perhaps the most serious and disheartening of all physical calamities, did not cause him to swerve from the intention to enter public life which had been formed in early boyhood. He deliberately set himself to smoke and to improve his taste for music, because these occupations would help him to pass his time independently of the attentions of other persons. He walked, rode, skated, and fished, and throughout his public career he eagerly promoted any promising scheme for the encouragement of habits of self-reliance and means of self-support on the part of the blind. After his accident he returned to Cambridge, where he resided for some time. In 1863 he published a *Manual of Political Economy*, which commanded a wide sale, and was reissued in successive editions, until at the time of his death it had reached a sixth. In the same year (that of 1863) he was elected professor of political economy, and he continued to hold this appointment throughout his life, republishing in the form of books more than one course of the lectures which he had delivered from the chair. In 1867 he married Miss Millicent Garrett, and in 1877 he was for some little while a candidate for the mastership of Trinity Hall, finally withdrawing, together with the Rev. Henry Latham, in favour of Sir Henry Maine. Meanwhile he had, after standing and then withdrawing as a candidate for the parliamentary representation of Southwark in 1860, and contesting Cambridge and Brighton unsuccessfully in 1863, been elected for the latter constituency at the general election of 1865, and had entered Parliament as an advanced liberal. In the House he adopted an independent attitude on more than one occasion. He supported Mill in the proposed extension of the suffrage to women; he advocated the in-

clusion of the agricultural labourers within the range of the Factory Acts; he pressed for the abolition of religious tests in the Universities in 1870; he separated from the Birmingham League on the question of national education, and he was largely instrumental in defeating Mr. Gladstone's Irish University Bill in 1874. But it was as "member for India," as he came to be called, that he won especially a reputation, and it was in this capacity that he occupied the most distinctive position. He devoted considerable attention to the study and improvement of Indian finance, which he regarded as the key to the successful and useful government of India. He maintained that India was manifestly a poor country, associated in partnership with a rich country like England, and that in the terms and regulations of this partnership there should be the most scrupulous avoidance of anything that savoured of meanness or injustice. The account-keeping should be at once strict and clear, and the budget, instead of being discussed at the fag-end of the session, should be introduced at an earlier period and carefully examined, and, if need be, severely criticised. But, while the finances of India required this vigilant watchfulness, the Indians themselves were unrepresented in Parliament, and the government officials were, not unnaturally, inclined to resent unpleasant inquiries. Fawcett, however, overcame official opposition, and secured the full investigation of these matters before parliamentary committees. He wrote some articles on the subject for the monthly magazines, in which he showed that the revenue of the Indian government was inelastic, while its expenditure was elastic and increasing. The revenue derived from the land tax was settled in perpetuity in some districts, and for long periods in others. The revenue derived from the cultivation of opium as a government monopoly, or from taxes on its exportation, was precarious. The salt tax was imposed on a prime necessity of Indian life, and the other sources of revenue were inconsiderable. But the expenditure was continually growing. The cost of the civil service and of the army was increasing, the burden of the interest of the debt, which had to be remitted to England, was rendered heavier by the fall in exchange, and the execution of expensive works of irrigation and railway construction, and there was no surplus to meet such recurring emergencies as a famine. The practical sagacity and sober common sense with which Fawcett addressed himself to the consideration of these questions of finance, which his training as an economist fitted him to handle, the generous hatred of injustice and oppression which led him to insist on the strictest equity in the relations of England to India, the appreciation of plain simple principles, which inclined him to interest the public in a few broad considerations of importance, and the resolute independence with which he persevered in his inquiries, were perhaps the most conspicuous features of his character, and they revealed themselves also in his attitude on other questions of political interest and in his writings on economic matters. He opposed the extension of the Factory Acts to adult women for fear of undermining their independence, and he urged the preservation of commons in the interest of the neglected agricultural labourer. In the election of 1874 he was defeated at Brighton, but was almost immediately selected as a candidate for Hackney. He was successfully returned, and occupied this seat, in spite of differences, frankly confessed and courageously maintained, with sections of his constituents, until his death. In 1880, on the formation of Mr. Gladstone's ministry, he was offered, and accepted, the post of Postmaster-General, when he introduced some changes of practical convenience, and some reforms designed to elicit and render easier the thrift of the poor. His administration was allowed on all sides to be most successful, and to afford evidence of the possession of practical qualities of a high order. "He regarded the post-office," writes his biographer, "as an engine for diffusing knowledge, expanding trade, increasing prosperity, encouraging family correspondence, and facilitating thrift." In 1882 he was attacked by an illness which aroused a remarkable amount of public sympathy. From this illness he eventually recovered, but in 1884 he succumbed rapidly to the effects of a chill. After his death Mr. Gladstone, writing to his father, declared that there had been no public man of our day whose remarkable qualities had been more fully recognised by his fellow-countrymen, and more deeply embedded in their memories. These qualities were, as it has been already attempted to show, largely of a practical order, and he cannot be said to have contributed much to the development of economic theory, though his powers of exposition were considerable. His love of independence and abhorrence of pauperism were shown in two little books—one on the *Economic Position of the British Labourer*, and the other on *Pauperism*, and he strenuously opposed any scheme of social reform which promised, by invoking the power and resources of the state, to endanger individual initiative and discourage private experiments. This spirit was also shown in the new chapter on State Socialism, which he added to the sixth edition of his *Manual*. He was, in fact, a faithful disciple of that school of economic thought which inclined in the direction of emphasising individual liberty and limiting the interference of the state, although he was willing enough that the state should endeavour to elicit thrift and self-help through the medium of the post-office, or protect the

interests of those who could not defend themselves—such as children who needed education, or agricultural labourers who were deprived of commons. His *Manual* was in the main, and it was intended to be, an abridgment of Mill's larger work, but he added materials of his own on such practical subjects as Co-operation and the Poor Law. His *Free Trade and Protection* was also, together with apt and recent illustrations drawn from the practice and facts of commerce, an exposition of orthodox theory. A biography of him has been written by Sir Leslie Stephen under the title *Life of Henry Fawcett* (1885). From this biography the appended list of his books is taken—

A Manual of Political Economy, 1863 (sixth edition, 1883).—*The Economic Position of the British Labourer*, 1865.—*Pauperism: its Causes and Remedies*, 1871.—*Essays and Lectures on Social and Political Subjects*, by Professor and Mrs. Fawcett, 1872.—*Speeches on some Current Political Questions*, 1873.—*Free Trade and Protection*, 1878.—*Indian Finance*, 1880. See also L. L. Price's *Short History of Political Economy in England*. L. L. P.

FAXARDO. See FAJARDO.

FEALTY. It was the peculiar characteristic of the feudal system that the political position of individuals was determined by their relation to the land. The man who held land of another was for some purposes his subject, or at least his dependent. The tenant became his lord's man (Lat. *homo*); did homage to him, and took an oath of fealty (fidelity) to him. On this principle, only those who held directly from the crown should have taken an oath of fealty to the king, whilst their sub-tenants should have taken the oath of fealty only to them. In some countries this was the case. But in England William I. at the great council of Salisbury compelled all landed men to take an oath of fealty to him. The obligation of this oath would override that of fealty to an immediate lord, if the two happened to conflict. An oath of fealty is still technically due from a freehold tenant to his lord, if any lord can be found; but it is never exacted (see FREEHOLD, HISTORICAL; FREEHOLD, LEGAL). F. C. M.

FEDERAL CO-OPERATION. The federal principle is to be traced, in one form or other, in most of the organisations of any importance which make up the British co-operative movement. Its development has not been primarily due to any school of theory, but to considerations of economy and stability. Obviously, if the co-operative movement was to consist of anything more than a number of local societies, with no common policy, centre, or organisation, some federal arrangement would be necessary,—either that, or something in the nature of an amalgamation. The co-operators hold—and it would seem that experience justifies the opinion—that the combination of autonomy for purely local purposes, and federation for general purposes, is the best working form of constitution. It gives at once a large measure of liberty, together with all the advantages and economies to be derived from mutual organisation. The federal theory of government adopted by the co-operators is based simply on expediency and experience. As the movement has grown, so it has become advisable to provide, not for the supersession of local effort by any form of central administration, but for the better co-ordinating and more effective interaction, for the common benefit of local effort and organisation. But though federalism has been of spontaneous growth, the massing of local effort and resources for common purposes has inevitably had a stimulating effect, in its turn, on the movement as a whole. The federal embodiments tend to become propagandist bodies; their advice and help is sought by the weaker members of the associated groups, and they increasingly focus the opinions of the main body on matters affecting their social and political interest.

The Co-operative Union, to which most of the societies are attached, provides a sort of consultative and advising executive for the movement, and organises an annual congress, attended by delegates from the united societies. It is largely due to the influence of the union that such extraordinary uniformity characterises the constitution and methods of the societies. No pains are spared in devising the very best rules, as a guide to local effort; and the Industrial and Provident Societies Act, 1876, of which the union is the parent, forms the legislative basis for these rules. An amended act, promoted by the Co-operative Union, was passed in 1893. The functions of the executive of the union, which is known as the central board, are declared to be to act as (*a*) a board of legal and general advice in all matters relating to the business and interest of societies as co-operative associations; (*b*) a statistical bureau, collecting and collating for the free use of societies every kind of information likely to be of service to them; (*c*) a propagandist agency for the dissemination of principles of co-operation throughout both Great Britain and Ireland, and afterwards to the world at large. No society is admitted to the union unless its management is of a representative character, nor unless it agrees to accept the general principles enunciated by the union in favour of the promotion and practice of truthfulness, justice, and economy in production and exchange. The name of Mr. Vansittart NEALE will always be associated with the Co-operative Union, of which he was secretary for many years, and to which he devoted infinite labour. The present secretary is Mr. J. C. Gray; the headquarters of the union are at Bank Buildings, Nicholas Croft, Manchester. There are some co-operative societies unaffiliated to the

union, but the majority recognise the advantages which it offers, and subscribe to its funds, take part in the election of its executive, and send their delegates to the annual congresses.

The two co-operative wholesale societies—one of which embraces England and Wales, the other Scotland—are in many ways the most remarkable and powerful workmen's organisations in the world. Both are due to federal developments. The two federations are, in the first place, wholesale agents for the supply of their constituents, the retail stores. The capital is accumulated in precisely the same way as in the stores, which are conducted on what is known as the Rochdale system. Thus a society, on applying for membership, has to take up so many shares—not less than three £5 shares for every twenty members, or fractional part of twenty—on which it pays, on admission, not less than one shilling on each share. These shares are transferable only—that is to say, they may not be withdrawn, but only disposed of to some other society within the federation. No dividends on purchases or interest on capital (which is fixed at 5 per cent) can be withdrawn until such time as the shares are fully paid up. The usual plan is to allow the dividends and interest to accumulate until this shareholding qualification is reached. But the object of the wholesale societies is not to make profit, but to effect economies for their constituents by direct and effective purchasing. Their operations are conducted on such a gigantic scale that they are enabled to command the best terms to be had in the market; and with their fleet of half-a-dozen steamers, their buyers in different parts of the world, and their system of cash trading, they are practically independent of the middleman. At the end of 1904 there were 1150 societies, comprising 1,594,145 members embraced by the English federation, with a share capital of £1,196,703, and loans and deposits amounting to £1,769,006, whilst the sales for the year stood at £19,809,196. The Scottish society's share and loan capital at the same date amounted to £2,130,225, and its trade for the year was £6,801,272. These two federations, though distinct in their constitution, work together in many ways in making their purchases; so that the combined influence of the British co-operators is brought to bear upon the markets of the world. The federal agencies have many advantages not possessed by the ordinary trader. They are practically free from bad debts, as the societies are only allowed the briefest credit; their dealings are not speculative, inasmuch as their constituents provide an assured market whose demands can be foreseen with practical certainty from year to year; and their expenses for travelling and advertisements are very small. The cost of management is also extremely low. The constitution of the societies is on the basis of membership, not of stock. The societies composing "the wholesale" may nominate one representative for every 500 of its members, to represent them at the general or branch meetings, which are held quarterly. These meetings examine the balance sheet, and discuss the proposals submitted by the directors of the society, who in their turn are elected by the retail societies. In addition to acting as wholesale purchasers, both the English and Scottish wholesale societies have started manufacturing on a considerable scale, the branches of industry selected being those for which there is the most constant and regular demand—such, for instance, as boots, ready made clothes, furniture, flour, soap, and so on.

The federal principle has also been adopted for many years in the co-operative flour-mills, many of which exist in the northern and midland counties. There is no need to enter into details as to these bodies, which are conducted on the same basis as that of the co-operative wholesale societies, a fixed rate of interest being paid on capital, whilst the savings effected after paying working expenses and depreciation are returned to the shareholders' societies in proportion to the amount of their purchases. These mills, however, form a highly important part in the economy of co-operation; and they have served more than once to break up flour rings; whilst their influence on the prices of bread affects others besides co-operators.

The Co-operative Insurance Society is another federal association which has been promoted, for fire and life insurance, amongst co-operators. The Co-operative Newspaper Society conducts a weekly paper, the *Co-operative News*, its shares being subscribed for the most part by co-operative societies, though there are a certain number of individual members. A good many co-operative productive societies are conducted partly on a federal, and partly on an individual basis, the capital being found, and the direction provided, by co-operative societies and individual co-operators as well.

Something must be said upon the controversy as to the merits or demerits of co-operative production conducted upon the federal principle. The main arguments of the anti-federalists are based upon the fact that under the federal system the consumer and not the producer receives the first consideration—manufacture is carried on, not for the benefit of the workman but for the use of those whom he serves, though now in the Scottish Wholesale Society the workers receive a share in the profits. This school would be appeased in part if the workmen were allowed to share in the profits and management with the consumers; and various schemes have been put forward with the view of detaching the productive departments from the co-operative wholesale societies, and placing them under the director-

ship of the workmen employed. It is claimed also that under the federal system there is an absence of that spontaneity and scope for free development which alone can call forth the spirit and energy which must be the inspiration of co-operative production. On the other hand, the federalists point to what has been attained by their system, and to the comparatively scanty results of co-operative production carried on independently of the consumer. A considerable section of this school contend that co-operation is not concerned with profit-making, though the dividend is a feature of all the societies, but with a system of production and distribution based upon use. They hold, however, that good wages, good hours, good surroundings, and general conditions of work are on the whole more advantageous to the workmen than a problematical share in more or less speculative profits. As to management, they take the line that it is impossible for the workmen to hold the balance true in matters of workshop administration; and it must be confessed that a study of the history of co-operative production bears out this fact (see *Co-operative Production*, by Benjamin Jones). Though an award based upon the achievements of the two schools is by no means conclusive as to their merits, yet the controversy is coming to turn more and more on results, and the increased attention paid to the interests of labour by the federated societies may perhaps in time satisfy those who claim—and rightly claim—that the interests of the workman-consumer can never be served by depreciating the value of labour. It is, however, evident that experiments will continue to be freely tried in conducting co-operation on a basis in which federalism plays no part, and in which the consumer does nothing more than trade with the workmen associated in production.

[See *Co-operative Wholesale Society's Annuals*, published at Balloon Street, Manchester; and *Reports of Annual Congress of the Co-operative Union*, Bank Buildings, Nicholas Croft, Manchester.]

V. N.

FEDERATION, COMMERCIAL, as applied to the British empire, aims at establishing closer and more favourable trade relations between the colonies and the mother land than those which now prevail. When Great Britain, commencing in 1846, adopted the principle of free trade, she finally abandoned the right which she had previously exercised of directly regulating the commercial relations of the colonies. Those colonies had up to that time enjoyed advantages over foreign countries in British markets for many of their products, and in return they had often submitted to trade restrictions imposed by the imperial parliament. They were now to receive no better and no worse commercial treatment than foreign countries; they were on the other hand to be left quite free to frame such trade policies as seemed to themselves best, without reference to other interests than their own. The result has been the adoption of extremely divergent systems in different parts of the empire. While the United Kingdom has followed out the principle of free trade, imposing duties for revenue alone, several of the most important self-governing colonies have adopted tariffs intended not only to produce revenues, but to artificially develop local industries by shutting out the products of other countries and even those of Britain itself.

In thus having no fiscal system common to all its parts, the British empire occupies a position peculiar among all the nations of the world. The fact is accounted for in part by the extremely anomalous composition of the empire. "In it we find communities existing under widely different conditions, some with vast populations concentrated in a small space, while others have their inhabitants thinly scattered over immense areas. Some with wealth which lends itself readily to direct taxation, others which can only collect revenue easily at the ports; some chiefly engaged in manufacture, others in the production of food and raw material; some with capital and cheap labour in such abundance that they can cheerfully face any competitors, others under severe pressure from the competition of commercially hostile neighbours more rich and numerous than themselves" (*Imperial Federation*, Parkin, p. 279).

It seems not unreasonable to suppose that this very variety of condition might have been turned to account in forming a common system. But no serious effort was made to check the tendency to commercial separation on account of two false assumptions on the part of political thinkers of the last generation. The first of these was that all other nations would soon follow the example of Great Britain in the adoption of free trade: the second, that the growth of the great colonies must inevitably result in their separation from the empire. The persistent advance of protective systems abroad has turned attention to commercial federation as a means of maintaining industrial prosperity: the growing belief that the empire can and should be held together has led to its consideration as helpful to the maintenance of political union.

All known precedents lead us to associate the idea of commercial federation with that of political federation. In the existing federal systems with which we are familiar, such as those of the United States, Germany, Switzerland, Austria-Hungary, and Canada, freedom of internal trade has been the result, even where it has not been the fundamental condition, of political unity. In the system which has been proposed for the Australasian colonies one of the

chief objects aimed at is the same freedom of internal trade. Free commercial intercourse, indeed, seems one of the most distinctive marks of national unity. It appeals directly to the masses, and gives at once a sense of mutual interest and mutual benefit. A common flag and common appliances for defence may mean more in times of danger: under the normal conditions of peace, the unhindered movement of commerce has the greater significance as a mark of common national life. The tendency, therefore, to look to commercial unity as a bond of national unity is natural and reasonable. Different methods have been suggested by which a greater or less degree of commercial unity may be attained.

1. By general adoption throughout the whole extent of the empire of the system of free trade as it prevails in Great Britain. The existence of high tariffs in many of the colonies, and especially of those imposed on great numbers of articles in order to give protection of local industries, certainly tends to weaken the sense of community of interest which is the strongest of national bonds. Earl Grey has pointed out (*Commercial Policy of the British Colonies, 1892*), that a feeling of annoyance has not unnaturally been caused among the merchants and manufacturers of the United Kingdom by finding the products of British industry prevented from competing on equal terms with similar goods produced in the colonies, while at the same time narrow feelings of commercial jealousy have been fostered in the colonies. He continues: "It is not only between this country and the colonies but between the different colonies with each other that feelings of animosity have been excited by the measures adopted in pursuance of the policy of protection. A few years ago bitter, and just, complaints were made in Tasmania of the conduct of their neighbours in Victoria in imposing duties on the fruits of Tasmania to protect their own growers from their competition. There have been disputes of the same nature between Victoria and New South Wales, and between New South Wales and Queensland, and quite lately threats at least of a tariff war between Canada and Newfoundland. In this manner it is to be feared that feelings far from favourable to the maintenance of a firm union of all parts of the empire must have been created both in this country and in the colonies."

The federation of the Australian colonies, the amalgamation of Newfoundland with the Dominion, will put an end to the conflict of interests between these colonies; it is not so easy to find a solution as complete where the interests of the United Kingdom and the colonies in the same way are opposed to each other. Purely protective tariffs could be removed; to do the same with ordinary tariffs, often necessarily high, would not be easy. Even the United Kingdom would suffer considerable loss of revenue if the duties were remitted on the tea, coffee, and one or two other articles subject to duty imported from India, Ceylon, and other parts of the empire. But the chief difficulty would occur in the colonies, which, great and small, depend chiefly upon import duties for their public revenues. In most cases the bulk of these imports come from the United Kingdom or from other colonies. Inter-imperial freedom of trade would therefore leave a very large amount of necessary revenue to be raised by direct taxation. To such taxation the objection felt in most of the colonies is so decisive as to render impracticable its substitution for import duties. Complete freedom of trade within the empire, therefore, such as exists between the different parts of the United Kingdom, of Canada, of the United States, or of Germany, is at present admitted to be impossible. Still the abolition of protective duties throughout the colonies, and the limitation to a few articles of import duties imposed for revenue alone, would be a great advance towards commercial union. The desire, felt as strongly in many of the colonies as in foreign countries, to build up manufacturing industries, and the belief that this can best be done by protective tariffs, are the chief obstacles to the adoption of this policy. There are indications, not as yet entirely decisive, that in the colonies, as in the United States, faith in the protective system of developing industries is giving way. Should this change of public opinion go on, the prospects of commercial union by means of greater freedom of trade will be improved.

2. A system of preferential tariffs has been proposed in order to secure some measure of commercial federation while recognising existing differences of policy. Under this system, while each self-governing division of the empire would be left as free as before to choose between a tariff for protection or one merely for revenue purposes, it would be bound to make a fixed discrimination in favour of countries within the empire as against countries without it. The advocates of preferential tariffs for the empire claim that by them several important results would be secured. The preference given to colonial products in the home market would, it is believed, tend to direct emigration towards countries under the British flag, thus retaining as citizens great numbers of emigrants who now go away to add to the strength of foreign nations. This increased colonial population, with its greater productive power, would gradually make the empire almost entirely independent of other countries for supplies of food and raw material of manufacture: it would also furnish a large, friendly, and constantly increasing market for the output of British manufactures. The immense extent of the national territory and the variety of its produc-

tions are facts which are relied upon to give weight to these arguments for preferential tariffs. The undeveloped or half developed areas under the British flag in every zone produce almost every kind of food, every raw material of manufacture, every article of use and luxury. The sufficient application of labour and capital, it is argued, is all that is necessary to bring production up to the level of national consumption. The overflowing population of the United Kingdom and its superabundant capital would thus find the necessary outlet within the empire, and the colonies in these respects would receive what they most need. It is even asserted that if the resources of the empire were fully developed there would be no need to draw upon other parts of the world for any article of commerce, and that within a measurable time the supply of her colonies and dependencies would furnish full occupation for the factories of the United Kingdom.

Another argument has had much weight. The belief of the early advocates of free trade that all nations would be led to adopt that system having proved fallacious, it is now claimed that preferential tariffs within the empire will prove the best means of obtaining better trade relations with foreign protective countries. At present, for instance, the United Kingdom continues to give free admittance to American products, although the United States show an increasing tendency to impose duties for the express purpose of keeping out British and other goods, and so securing the home market for the home manufacturer. Cut off by a preferential tariff from free access to what is his best market, the American, it is said, would be glad to make concessions in order to regain his old privileges. In this case a preferential tariff would be a temporary expedient for coercing protective nations into a greater or an absolute freedom of trade.

Some of the difficulties in the way of adopting a preferential tariff are obvious. The United Kingdom still depends upon foreign countries for more than 75 per cent of its imports: these would be taxed to favour countries which furnish less than 25 per cent. Granting that the empire can produce within itself all that it requires, a lengthened period must elapse before it actually does so, and there still remains the doubt whether natural conditions would allow the products to be supplied as cheaply by places within the empire as by places without it. Sir Rawson Rawson has pointed out (*Analysis of the Maritime Trade of the United Kingdom*) as an important consideration, "the inconvenience, expense, and intolerable delay that would be imposed upon commerce by the revival in England, and the universal adoption elsewhere, not only of a duty upon every article, but of a discriminating duty upon every article, which would necessitate the revival of the system of certificates of origin. . . . Its re-imposition here and its universal introduction into every part of the empire, considering the immense increase of trade at the present day, would strike a blow at the freedom of commerce which would go far to counteract any advantage arising from the proposed difference in the rate of duty."

3. A plan for preferential tariffs within the empire was submitted to the colonial conference of 1887 by Mr. Hoffmeyer, one of the representatives from Cape Colony. Mr. Hoffmeyer, in proposing that on all produce imported into the United Kingdom and the colonies from foreign countries a small fixed duty should be levied over and above any duty which like imports had to pay when coming from British countries, added the important condition that the revenues derived from this additional duty should be paid into a common fund for national defence. Such a plan, he said, would "establish a feeling on the part of the colonies that whilst they were paying for the defence of the empire they were at the same time enjoying in British markets and inter-colonial markets certain advantages which foreigners did not enjoy. That would establish a connecting link between the colonies mutually as well as between the colonies and the empire also, such as is not at present in existence, and which might further develop by and by into a most powerful bond of union" (*Proceedings Col. Conference, 1887*, vol. i.). Mr. Hoffmeyer estimated that an additional duty of 2 per cent on all imports of foreign produce would give a revenue of £7,000,000, a sum which would materially lessen the burden of taxation for defence. Under existing circumstances this method would apparently bear heavily upon the mother country. Whereas more than 75 per cent of the imports of the United Kingdom are from foreign countries and therefore liable to the additional duty, the imports of the colonies are chiefly from the United Kingdom or from other parts of the empire, and therefore not in the same way liable. In the case of South Africa only about 10 per cent of the whole imports would pay the duty; in Australia 15 per cent or 20 per cent; in Canada 35 per cent or 40 per cent. The distribution of the tax would therefore not be at all in proportion to the whole volume of trade to be protected.

The fairness of the impost might be destroyed in another way. A section of the empire might adopt tariffs practically prohibitive of products from other sections. To these latter it would be no advantage that still higher duties were nominally charged on foreign products. It is to be noted, too, that the value of the additional duty as a means of raising revenue for defence would diminish in exact proportion to the attainment of the other object of preferential tariffs, viz. the self-dependence of the empire for exports and imports.

The difficulties, therefore, which confront any plan hitherto suggested, for the commercial federation of the empire, are many and great. On the other hand, if the stringent methods of protection adopted by foreign communities are maintained, there is no doubt that the minds of producers, traders, and statesmen alike will be turned more and more to seek within the empire the free commercial intercourse which is denied without. The gradual formation of a strong political bond may lead to the gradual assimilation of commercial systems. Prof. Nicholson says (*Britannic Confederation*, page 95): "Nothing is more common than to speak of the complicated tariffs and the vested interests of the newest colonies as insuperable obstacles to any general fiscal reform. As a matter of historical fact, however, in much less than a century the commercial policy of the British empire has passed, speaking broadly, from the extreme of central regulation to the extreme of non-interference, and there is, *primâ facie*, no reason why a reaction should not occur if such a course is shown to be to the mutual advantage of the colonies and the mother country." The confederation of groups of colonies like those of Australia and of South Africa, carrying with it, as confederation has already done in Canada, entire freedom of commercial intercourse between the different provinces, will do much to reduce the existing complexity of tariffs. Any inclination towards free trade in the protective colonies, even to the extent of lessening the number of articles taxed, would render much easier the task of arranging these tariffs on a basis of mutual advantage throughout the empire. The attitude of foreign nations on trade questions will probably go far to determine the strength of the forces which make for or against commercial federation.

[See Sir Rawson Rawson's *Synopsis of the Tariffs and Trade of the British Empire.—Sequel to the same.—Analysis of the Maritime Trade of the United Kingdom 1869 to 1889.—Analysis of the Maritime Trade of the United Kingdom 1889 to 1891, with special reference to the proposals for the establishment of a Zollverein.*—G. W. Medley (Cobden Club, 1892), *The Fiscal Federation of the Empire*. To *Britannic Confederation 1892*, Prof. J. S. Nicholson contributes an article on "Tariffs and International Commerce," and Mr. G. G. Chisholm one on "The commerce of the British Empire." *Blue book, No. C. 5091*, fully reports the discussions of the colonial conference of 1887 on Mr. Hoffmeyer's scheme for an Imperial Zollverein. G. R. Parkin's *Imperial Federation the problem of National Unity*, gives a chapter to Trade and Fiscal Policy. H. O. Arnold-Forster, M.P., edits *Tables published by the London Chamber of Commerce*. Much leaflet and pamphlet literature has been published by the United Empire Trade League, a body "formed for the purpose of promoting mutually advantageous trading relations between all parts of the British empire upon a preferential basis." The same may be said of the Fair Trade League, "formed to agitate for such fiscal readjustment as shall prevent the products of foreign states, which refuse to deal with the United Kingdom in fair trade, from unduly competing in British markets with the products of home labour: and to promote, by means of the bond of commercial union between the mother country and her colonies and dependencies, an extension of trade with our own empire." The publications of the Imperial Federation League discuss impartially the merits of free trade and of preferential trade as offering each a possible basis of commercial federation. Articles touching upon the question have been numerous in most of the leading magazines during the last few years.] G. R. P.

FEE. (*a*) In English law the term *fee* means an estate of inheritance as distinguished from a lesser estate, but in feudal law it was used to denote that which was the "subject of tenure" as opposed to the *alod* or hereditary estate, for which the owner rendered no service to a superior (see FEOD; Challis on *Real Property*, London, 1885).

(*b*) Payments made by suitors in courts of justice or to the steward of a manor. The former are regulated by ancient usage or by rules of court, the latter are regulated entirely by custom (see Scriven on *Copyholds*, London, 1882). J. E. C. M.

FEE (Scots law). The right of a tenant or "feuar" of land under the feudal system of tenure: also reversion and remainder. The rules of law relating to fee are based on the principle that the fee can never be *in pendente*, for the superior, or lord, is always entitled to have a vassal.

[For the fee in the case of an heir of entail, see ENTAIL (Scotland). See Bell's *Principles of the Law of Scotland*, §§ 1713-1715.] A. D.

FEE SIMPLE. An estate "descendible to the heirs generally, that is, simply, without restraint to the heirs of the body or the like" (*Co. Litt.*, 1 b). It is the greatest estate or interest which the law of England permits any subject to enjoy in land. In theory the ultimate ownership belongs to the crown. Williams (in *Principles of the Law of Real Property*, London, 1892, p. 54), says, "A small occasional quit-rent, with its accompanying relief, suit of the court baron, if any such exists, an oath of fealty never exacted, are now, it appears, the ordinary incidents of modern socage tenure" (see Digby's *History of the Law of Real Property*, Oxford, 1884; Williams, on *Real Property*, 19th ed. 1901). The owner of a fee simple has full power of leasing or alienating it, and on his death it descends to the heir of the last person who acquired the estate otherwise than by descent.

J. E. C. M.

FEELING OF VALUE. See VALUE.

FEE TAIL. Land is held in fee tail if, according to the intention of the original grant, it

passes, on the death of any individual owner, to one of the descendants of the original donee. Land may be held in "tail general" or in "tail special." In the first case the grant is made to the use of "A and the heirs of his body," and the land descends to the next heir of the original donee according to the rules regulating the intestate succession to land held in fee simple (see HEIR); it therefore passes to females in default of males of the same degree. Gifts in "tail special" occur much less frequently than gifts in tail general, the least rare instance being a gift to the use of "A and the heirs *male* of his body," in which case female heirs are excluded. If the tenant in tail is in possession he can, by the execution and enrolment of a disentailing deed, convert the fee tail into a FEE SIMPLE (*q.v.*), and thus becomes absolute owner of the land. If, however, the land is in the possession of a tenant for life on the death of whom it would pass to the tenant in tail, the latter cannot bar the entail except with the concurrence of the former, who for that purpose is called the "protector" of the entail. In the case of large family estates the land is generally held by a tenant for life under the provisions of a settlement, the tenant in tail being entitled to succeed on his death; and it is usual, as soon as the tenant in tail attains his majority, to "resettle the estates" by barring the entail, giving the former tenant in tail an estate for life and making his next heir tenant in tail in remainder. It is one of the commonplaces of popular oratory to say that the free movement of land is hindered by "the law of entail"; but, as shown above, entailed land, if not forming part of a family settlement, can always be brought under the absolute control of the owner; settlements, not entails, impose fetters on land. But even these fetters can easily be broken through, as under the provisions of the Settled Land Acts the tenant for life has, subject to certain excepted parts, the power to sell any part of the settled land at his discretion; and as regards the excepted parts (mansion-house, heirlooms, etc.), he can do so subject to the consent of the court. [For further particulars see ENTAIL, LAW OF.]

FELDAGE, see FALDAGE.

FELT, JOSEPH B. (1789-1869), was born in Salem, Massachusetts, and was educated for the Congregational ministry, from which he early retired. Throughout his life he engaged in antiquarian researches of a historical and statistical nature. To the economist the most important of his writings are: *Historical Account of Massachusetts Currency*, Boston, 1839, pp. 259; and the contributions to *Collections of the American Statistical Association*, vol. i., Boston, 1847, containing especially *Statistics of Taxation in Massachusetts*, pp. 221-596. (See Memoir by Henry M. Dexter in *Mass. Hist. Soc. Proc.*, 1875-76, pp. 113-117.)

D. R. D.

FEMALE LABOUR. The introduction of machinery and the growth of the factory system have effected considerable changes in the conditions of female labour during the present century in every country where these causes have operated. Women in the poorer classes had been accustomed to add to the family income by casual work, and by spinning or weaving for manufacturers in their own homes. Much light is thrown on the conditions of working women in England, towards the end of the 18th century, by Sir F. Eden (*The State of the Poor*, 1797), but he does not always make it quite clear whether the women actually worked at the factory or at home. Home work was the rule, and of one village Eden remarks that "employment for labourers' wives and children is much wanted; they are oftener seen basking in the sun in summer, and shivering over a stolen wood fire in winter, than in any profitable exertions of industry." The use of machinery made it economically necessary for female labour to be employed at the factory itself, and a long uninterrupted working day was enforced instead of work at irregular intervals varied by household occupations. The increased demand for female labour in the factory was accompanied by a diminished need for their services at home. The questions of economic interest which the history of the employment of women should explain are (1) the extent to which they compete with men; (2) the effect of such competition on the wages of men in the same trade; (3) the effect of the economic independence of women on the rate of wages of men in the same class, and hence on the income of the family; (4) the effect of the employment of married women in factories on the well-being of the family. The first point is the only one on which we have statistics of any general value. The regulation of factories and workshops in which women and children work (*vide* FACTORY ACTS) has made it possible to obtain returns of the numbers of males and females in such factories in the United Kingdom.

It is in the textile industries that male and female operatives are most frequently to be found employed on the same kind of work. The factory returns show a steady increase in the proportion of female to male operatives since 1895 (for which year the first *compulsory* return was made). But it is a mistake to suppose that this is a proof of displacement of men by women; in several towns male labour has been attracted to higher paid occupations (*e.g.* machine-making), and female operatives have therefore been more easily obtainable than male operatives.

The census of 1901, however, shows that female labour is still in the main employed in supplying the same needs as a hundred years ago; but the work is done in the factory, workshop, school, or institution, instead of in the home.

E

UNITED KINGDOM.—*Number of Female to every 100 Male Operatives in Textile Factories.*

Year.	Under 14 Years.	14 Years and under 18 Years.	18 Years and upwards.	All Ages.
1895	118	187	158	161
1896	119	187	157	161
1897	122	194	160	165
1898	121	199	163	167
1901	116	208	166	171

Occupations of Women and Girls of 10 years and upwards, according to the Census 1901.

Industry.	Number.
Domestic Offices or Services	2,055,725
Clothing	903,646
Textile	867,259
Food, Tobacco, Drink, and Lodging	372,027
Teaching	203,132
Agriculture	133,607
Paper, Books, and Stationery	114,640
Commercial	80,532
Sick-Nursing	79,002
Metals, Implements, and Conveyances	65,142
Other and Undefined	385,248
Total occupied	5,309,960

A comparison of the census returns since 1850 shows that the employment of women relative to the female population is increasing between the ages of 15 and 25, and decreasing amongst women over 25, this decrease being probably mainly due to diminished employment of married women (*General Report on Census of England and Wales, 1901*, Cd. 2174); it is also largely due to the decreased demand for the casual labour of women in their homes, and the increased demand for regular labour in the factory (*Journal of the Royal Statistical Society*, June 1898). The England and Wales census 1901 gives the number of married and widowed women returned as occupied as 13·2 per cent of their total number, while 52·3 per cent of the unmarried women and girls over 10 years of age were returned as occupied. In 1851, the only year for which similar information was compiled, the census report stated that 25 per cent of the wives in Great Britain, and 67 per cent of the widows, were engaged in some extraneous occupation.

The effect of female labour on men's wages, and the extent to which it has superseded men's labour, are difficult to ascertain. Work requiring neither muscular strength nor long training would naturally be remunerated at a low rate, whether done by men or women, and much of the work in which women have superseded men is of this nature. Thorold Rogers remarks of women's labour in the 15th century, "that women's work, when of what we may call an unskilled kind, was equally well paid with that of men," and at the present time there is ground for believing that inequality in the rate of payment is most frequently to be found when women compete with men in work requiring training and education. There is not sufficient evidence to enable us to judge of the effect of married women's labour on the wage of the husband. For its relation to infantile mortality, see papers under this heading in the *Journal of the Royal Statistical Society*. (FEMALES AND CHILDREN, EARNINGS OF; FACTORY ACTS.)

[*Board of Trade* (*Labour Dept.*) *Reports* and *Home Office Factory Inspectors' Reports.*—S. Webb, *The Alleged Differences in the Wages paid to Men and Women for Similar Work.*] C. E. C.

FEMALES AND CHILDREN, EARNINGS OF. Previous to the growth of the factory system the earnings of women were principally gained by irregular work done at home for employers. Women also worked in the fields, but rarely for long periods, as such work made it necessary for them to leave their homes; it was more highly paid than those industries which were carried on by married women in their leisure hours. Adam Smith, in speaking of the domestic industries, says that "in most parts of Scotland she is a good spinner who can earn 20d. a week." Sir F. Eden (*State of the Poor*, 1797) gives the earnings of spinners in different parts of England: in Cumberland they earned from 4d. to 6d. a day; at Wirksworth by worsted-spinning 5½d to 6d. a day, and by cotton-spinning 3s. to 5s. a week; at South Tawton, in Devonshire, by serge-spinning 6d. to 7d. a day; at Colchester, children of eight or nine years of age spun for 2d. or 3d. a day, and women weavers earned 5s. to 5s. 6d. a week. At Leicester, women worsted-spinners earned 4d. to 8d. a day, and at Kilworth 6d. to 10d., children from twelve to fourteen earning about 6d. a day; at Kirkby Lonsdale, Underbarrow, Southam, Inkborough, and Sheffield the women earned 4d. to 8d. a day. Whereas the spinners at the last-mentioned town earned about 6d. a day, washerwomen earned 1s. a day and victuals. The earnings of lacemakers in Bedfordshire and Buckinghamshire ranged from 6d. to 1s. a day, a few women in Leighton Buzzard earning as much as 1s. to 1s. 3d. In Northamptonshire, the lacemakers by hard work earned 1d. to 1½d. an hour, the earnings ranging from 6d. to 1s. 2d. a day, but the ordinary earnings being about 8d. to 10d. a day. At Dunstable, the straw plaiters earned from 6s. to 12s., children earning from 2s. to 4s. a week. The total earnings in the factories were higher. At Carlisle, women in the stamperies earned 3s. to 12s. a week; at Manchester in the cotton trade from 6s. to 12s., 8s. being the average; at Birmingham in button-making, when in full work, 7s. to 10s. a week. In some cases, however, the wages in cotton mills and other factories are put at a very low rate, leaving it also somewhat doubtful whether the women worked the whole week at the factory. Thus, Eden says, that at Newark "women and children" earned 1s. to 5s. a week in the cotton thread mill; at Northampton 2s. to 5s.; but at Settle children eight to fourteen years of age earned from 1s. to 5s. or 6s. in the cotton works. Children under ten

earned 2s. 6d. a week for attending the machines at Frome, 2s. to 3s. in winding silk at Coventry, 1s. to 2s. 6d. in the silk and cotton mills at Derby, 2s. to 4s. at Manchester. In 1816 the average earnings of 316 children under ten years of age employed in twenty-four cotton factories in Preston were 2s. to 3s. 3d., the hours worked being 12½ to 13½ on ordinary days, and 9 hours on Saturdays. In some silk mills in Cheshire in 1816, of the people employed, fifty-four children under ten years earned from 1s. 6d. to 4s. a week, 129 young persons between ten and eighteen earned from 3s. to 8s. 6d., and of 114 men and women, the men earned from 9s. to 15s., and the women from 4s. 6d. to 9s. In 1832-33 the wages of women and children in cotton mills in Glasgow and Manchester were obtained with more exactitude.

Statement of the ages and wages of persons employed in cotton mills in Glasgow and its neighbourhood in 1832:

Ages.	Males.	Weekly Wages.
9 to 10	128	*1s. 3d. to 3s.*
10 to 12	361	*2s. to 4s.*

40 years and upwards	27·8	24·7	23·5	18·0
Number of servants on which the above averages are based	1867	2461	651	369

The board of trade report on the earnings of agricultural labourers [Cd. 2376 of 1905] states that Northumberland and Durham are the only counties in England where the employment, for wages, of women at ordinary regular work in the fields is a general custom. In Scotland women are frequently employed at field work, and in the Border counties and the Lothians

the number of women workers on many farms is nearly equal to the number of men; the women workers are usually paid between 8s. and 10s., sometimes 11s. a week, with extra money at harvest and sometimes at potato-lifting. The status of women workers on the whole appears to improve.

[*Parliamentary Papers, Labour Statistics*, 1887. —*Reports of Royal Commissions on employment in Factories*, 1832, 1841-43, 1862-66, 1874-76.— *Reports of Inquiries into employment of Women and Children in Agriculture*, 1867-71.—*Reports of Select Committee of House of Lords on Sweating*, 1888-90.—*Royal Commission on Labour—Reports on Employment of Women*, 1893.—*Board of Trade Report on Employment of Women in Flax and Jute Centres*, 1898.—*Life and Labour in London*, Second Series, vols. v. to ix., edited by Charles Booth.—*The Englishwoman's Year-Book*.—Publications of Women's Industrial Councils and of the Women's Trade Union League.] C. E. C.

FENELON, FRANÇOIS DE SALIGNAC DE LA MOTHE (1651-1715), born at the Château de Fénelon (Perigord), and died at Cambrai. He was the author of *Télémaque*, in which very decided communistic ideas are to be found; (*Bétique*, bks. vii. and *Salente*, bks. x. and xvii.), which have led the socialists to claim the writer as on their side. Strongly-pronounced views on commercial freedom are also to be found in the *Conseils de Narbal à Télémaque*, bk. iii. These, like the communistic ideas, cease to be surprising when the reader remembers that the book is a classical romance, written (1699) not for the public, but for the moral education of the Duke of Burgundy. Fénelon expressed his opinions more decidedly when passing judgment on the policy of Louis XIV. The letter which this eminent writer addressed to the monarch (dated about 1691-1694), the instructions which he gave to the king's grandson, the Duke of Burgundy, and finally many passages in *Télémaque*, for none of which Fénelon sought publicity, show how great a mind his was. Yet Fénelon was not free from the prejudices of his age in matters of politics and religion, Augustan age though that age might be called. Fénelon was appointed tutor of the Duke of Burgundy in 1689, and archbishop of Cambrai in 1695. He was from 1693 a member of the French academy. A. C. f.

FEOD OR FEUD. Land granted to be held of the grantor or donor as opposed to land (ALOD) which a man could call his own either personally or as a member of a group or tribe. Alodial land disappeared and the words *feod feudum*, came to be applied to an estate of inheritance as opposed to an estate for life (see FEE).

[Digby, *History of the Law of Real Property*, Oxford, 1884, pp. 31, 71. See also p. 31 for the various suggested etymologies of the word. Sir H. Maine, in *Early Law and Custom*, 1883, p. 338, discusses the history of the feud.] J. E. C. M.

FEODARY. A book or roll containing lists of knights' fees showing the liabilities of the tenants in respect of military service and scutage, and serving as an assessment for any system of taxation which has the knight's fee for its basis. The best known and most important feodaries are the "The Red Book" and "Small Black Book" of the exchequer, the *Liber Feodorum* or "Testa de Nevill," "Kirby's Quest," and the "Book of Aids." Of these the "Testa de Nevill" or "Book of Fees" is the most perfect specimen: it was compiled probably in the latter part of the reign of Edward I. and contains the result of an inquisition held during the last years of Henry III. and the first of Edward I., giving a detailed list of knights' fees, crown livings, widows and heiresses whose hands were in the gift of the crown, together with the scutages, aids, etc. payable by each tenant. The "Red Book" contains a list of all the scutages levied between 1156 and 1212, and the result of the inquisition held in 1166 on account of the marriage of Henry II.'s daughter; the latter is also contained in the "Black Book"; both books contain, besides, a large amount of miscellaneous matter more or less closely connected with the exchequer. "Kirby's Quest" and the "Book of Aids" contain the results of similar inquisitions held in 1296 and 1356 respectively. DOMESDAY BOOK, the earliest known survey of the country, differs from the above-mentioned works in having for its unit the hide instead of the knight's fee. These books are not merely of historical and antiquarian interest; they afford the student of economics an excellent means of determining the distribution of wealth and population in mediæval England (see KNIGHT'S FEE). A. E. S.

FEOFFMENT. The term applied to the conveyance of a fee, *i.e.* an estate of inheritance, by the livery or handing over of the seizin (*i.e.* feudal possession) of the land. It was the usual method of transferring fees in feudal times, and though it still survives it is rarely used.

[H. W. Challis, *Law of Real Property*, London, 1885.] J. E. C. M.

FEORMFULTUM. A term of Anglo-Saxon times of doubtful meaning. It sometimes applies to contributions in kind paid to the sheriff for the maintenance of the king and his household, corresponding to the later purveyance. Sometimes it seems to refer to the rent paid to the sheriffs for the occupation of unbooked folkland.

[Stubbs' *Select Charters*.] R. L.

FERDEL OR FERLING. A fourth part of a virgate, and, speaking generally, a sixteenth part of a hide. But as the hide contained a varying number both of virgates and of acres, the ferdel cannot be considered as a fixed quantity, though the normal ferdel was prob-

ably 7½ acres. The holder of a ferdel was reckoned among the lower classes of villeins, and seems not to have contributed an ox to the common plough-team.

[Vinogradoff, *Villainage in England*, 1892, pp. 148, 256.] E. G. P.

FERGUSON, ADAM, LL.D. (1723-1818), began life as an army chaplain, but in 1757 became librarian to the faculty of advocates at Edinburgh. In 1759 he was appointed professor of natural philosophy at Edinburgh university, from which chair he was transferred in 1764 to that of moral philosophy, which he occupied till 1785. While he ranks rather as an historian and a philosopher than an economist, Ferguson has a fair claim to the latter title through the *Essay on the History of Civil Society* (Edinburgh, 1767, 7th ed., 1814), and the *Institutes of Moral Philosophy for the use of students in the College of Edinburgh* (Edinburgh, 1769). The first-named work consists of an inquiry into the development of civilisation from the savage state: the influence of MONTESQUIEU is clearly seen in this as well as in his other writings. The style is diffuse and ornamental. Ferguson's views in pt. iv. § 1, on the advantages and disadvantages of individuals being confined to one particular employment, are entirely in accordance with those of Adam SMITH. Though this work was published nine years before the *Wealth of Nations*, it is not certain that Ferguson's ideas may not have been influenced by Smith, for the two philosophers were on intimate terms, and Ferguson entertained a high admiration for his friend. Several German writers, notably Karl MARX, referring particularly to the division of labour, consider Smith, but scarcely on sufficient grounds, as the pupil of Ferguson. In his *Institutes of Moral Philosophy*, which are written in a terse aphoristic manner, Ferguson deals with "arts and commerce" (pt. i. ch. i. § 9); here he admits his obligations to Joseph HARRIS (*q.v.*), to whom both he and Smith owe considerably, unless, indeed, Ferguson was acquainted with CANTILLON. He has, in the same work, a more important part (vii.) on "politics," subdivided into "public economy" and "political law." The former treats, among other subjects, of taxation, in respect to which he lays down the following six maxims: "(1) that the exigencies of the state must be provided for at any hazard or expense to the subject; (2) that in levying taxes no subject be unnecessarily burdened; (3) that the security of the subject, or that of his property, be not impaired; (4) that no useful branch of trade be unnecessarily burdened; (5) that taxes least felt as grievances be preferred; (6) that the least burdensome method of collecting taxes be chosen." Of these the 2nd, 3rd, 5th, and 6th convey some of the ideas included in Smith's 2nd, 3rd, and 4th canons, though the latter in every case cover far more ground. There is nothing in Ferguson corresponding to Adam Smith's first maxim. But Ferguson's examination into the expediency, or otherwise, of the various kinds of taxes, divided into capitation, assessment, customs, and excise, might almost have been the text of Smith's arguments on these methods of taxation. Pt. i. ch. i. § 7 of the *Institutes* deals with population, the laws of increase being set out, in some respects, as by Malthus thirty years later. In his *Principles of Moral and Political Science* (Edinburgh, 1792) —a revision of his own lectures—pt. ii. ch. vi. he treats of such economic questions as population, wealth, revenue, liberty, "judicature," and executive power. Here also he repeats his maxims on taxation, omitting the 4th and 6th but adding, "No tax should be laid on in such a manner as to drain the source from which it is derived." He does not mention Smith's canons.

With Ferguson political economy is only incidental, and not yet dissociated from "politics"; his views, without being entirely original, are considerably in advance of his predecessors', and more generally consonant with those of Adam Smith. In his opinions on mankind may be seen the dawn of what is now known as SOCIOLOGY. In his philosophical system, while being, on the whole, a pupil of Reid, Ferguson introduced a new theory by maintaining that the principle of perfection was of more importance than the principles of self-conservation and sociability, though he admits the influence of these latter, which had till then been held sufficient to explain human morality. Cousin considers that he was the first Scotch moralist to understand the true destiny of man. Ferguson also wrote an important *History of the Progress and Termination of the Roman Republic* (London, 1783).

[Small, J., *Biographical Sketch of A. Ferguson*, Edin., 1864.—*Encyclopædia Britannica*, suppl. to 4th, 5th, and 6th editions, art. "Ferguson," 1824. —Hasbach, *Untersuchungen über Adam Smith und die Entwicklung der Politischen Ökonomie*, Leipzig, 1891.—Cousin, V., *Cours d'histoire de la philosophie morale au 18me siècle;* 2de partie, Ecole Ecossaise, Paris, 1839-42.—Carlyle, Alex., *Autobiography*, Edinburgh and London, 1860.—Cockburn, Lord, *Memorials of his Time*, Edin., 1856.—Burton, J. H., *Life and Correspondence of David Hume*, Edin., 1846.] R. H. H.

FERM OR FIRMA. The composition paid by the sheriffs in Anglo-Saxon and Norman times, for the domain and other revenues due from their shire (see FARMING OF TAXES).

[Cp. the title of Madox's well-known *Firma Burgi*.] R. L.

FERRARI, JACOPO (living in 1600), born at Rovigo. Though a friar and a theologian, he maintained that payment of interest on money lent was justifiable. After giving a description of the different modes of operation then practised by the bank of St. Ambrogio at Milan, he

proved their lawfulness, and opposed and argued against the well-known objection of theologians, *pecunia non potest parere fructum nisi ratione lucri cessantis vel damni emergentis*, as it was referable to money in its primary use; in its secondary use it is a class of merchandise on which it is right to ask an interest for lawful transactions (see CANON LAW).

Digressio resolutoria in contractus usitatos a Banco S. Ambrosii ciuitatis Mediolani, per Fratrem Jacobum Ferrarium, Rhodiginum, in conuentu S. Mariae gratiarum Mediolani, Ordinis Praedicatorum sectorem primum Mediolani, 1623.

A. B.

FERRETTI, JULIUS (fl. 1500), a jurisconsult, born at Ravenna, who applied himself to subjects referring to the revenue. Like his contemporaries Francis Lucano and John Batacchio,—mentioned by Ricca-Salerno in his *Storia delle Dottrine Finanziarie in Italia*,—he considered that taxes should be for revenue only.

He wrote, *De Gabellis.—Quaestiones et decisiones utiles et quotidianae in materia vectigalium et gabellarum tam in terra quam in mari*, Venetiis, 1547.—*In civitate Campaniae* (Fabris), 1547, 8vo.

A. B.

FERRIES (Scotland). As in England, ferries are *inter regalia*, that is, they belong to the Crown, unless granted away. In that case the grantee must keep sufficient boats running in order to meet the requirements of the public, and the rates charged, if not specified in the grant, are regulated by the justices of the peace. Rights of ferry must not be evaded or competed with. Public ferries are under the administration of the local authorities, or of bodies constituted by special acts. A. D.

FERRONI, PIETRO (19th century), an abbot of Florence, was the author of—

Rapporto sopra una lettera sulla libertà del commercio dei viveri di Monsignor Antonio Scarpelli (6 Giugno, 1804).—In *Atti della R. Accademia dei Georgofili* (vol. v. Firenze, 1804).

A. B.

FEU (Scotland). Land held under the Scottish form of the feudal tenure, copyhold in form, freehold in substance, though subject to seizure (after declaratory action) for failure to "pay the canon," or meet the stipulated annual payments to the immediate superior. The feu is, in effect, land held under conditions of fixity of tenure for an indefinite period, fixed rent, and free sale or subletting, subject always to the conditions of the original grant. The tenant of a feu is called the "feuar," or in popular language, or even in legal narrative, the "proprietor"; the lord or granter, who receives a fee-farm rent, as also certain incidents or "casualties," is called the superior, and his rent the feu-duty. He in his turn may have superiors over him, and so on up to the Crown.

A. D.

FEUD. See FEOD.

FEUDALISM, ITS ECONOMIC CHARACTERISTICS. It is difficult to state with precision the economic characteristics of feudalism; partly because the term itself is used very loosely, and partly because the conditions which it is commonly employed to denote did not long remain absolutely unchanged in any country, and were not altogether identical in any two. For the present purpose it will be allowable to use "feudalism" for the whole complex of social relations in Western Europe from about the 10th to about the 15th century. "Feudalism" must, indeed, in the strict sense of the term, be defined as an organisation resting on a peculiar system of land-tenure—a system in which ownership was divided between tenants and lords, and in which the connection as to land was accompanied by a close personal tie between lord and tenant, involving mutual rights and duties. The economic features of mediæval life were many of them the results of this system of land-tenure; but it would be pedantic to confine our attention here to those which could be definitely connected with it.

I. Early feudal society was (1) almost exclusively agricultural, and (2) the population was divided into two great rural classes, the lords of the soil (from the king and the great vassals down to the pettiest *seigneur* or manorial lord), and the cultivators of the soil. The husbandmen were able to spend only part of their time—as a rule, perhaps, less than half—on the cultivation of their own holdings; the rest of their time was devoted to labour upon the demesne of their lords. In the later feudal centuries these labour services were, in whole or in part, commuted for money payments: a change which, if we may judge from modern experience in eastern Europe, must have led to a great increase of production both on the servile holdings to which the tenants were now able to give the whole of their labour, and on the demesnes which could be better cultivated by hired labourers than by unwilling serfs. (3) Those lords, lay or clerical, who held many estates were obliged to devise methods by which the net produce could be forwarded to them; but with this exception each MANOR or Seigneurie (*q.v.*) formed a self-dependent economic unit, scarcely connected by exchange with the outside world. (4) Such exchanges as went on, and such dues as needed to be rendered, within or without the rural group, were arranged in what later economists have called a *Naturalwirthschaft* as opposed to a *Geldwirthschaft;* payments in kind or in services being the rule instead of payments in money. (5) Social relations were also marked by a high degree of fixity. Labour dues must, at some period, have become limited; but once the limitation was made, it remained for centuries unchanged; and, again, after labour was exchanged for money, the payments rapidly became well-nigh unalterable. There

was but little movement from place to place on the part of the vast majority of the people; ascription to the soil being not only a legal rule but a social custom. Population, moreover, increased so slowly that there was little difficulty in finding room for additional members in each manor. The forces which are now summed up in the term "competition" were not, indeed, altogether absent; but they were so much weaker than they are now, and they moved within such narrow limits, that they may almost be regarded as non-existent.

II. In a feudal kingdom sovereignty tended to disappear in suzerainty. But the king, besides being the supreme over-lord, was himself the immediate lord of great estates. The royal court was normally maintained by the proceeds of the royal manors. In time of war the overlord called upon his vassals for personal service. (1) Thus neither for the ordinary nor for the extraordinary needs of government was taxation resorted to unless as an exceptional occurrence,—a marked contrast alike to the financial system of the later Roman empire and to the habitual reliance on taxation of modern states. (2) Taxation being something exceptional, it was held to require the express consent of those to be burdened. Herein appeared the motive which led to the establishment of parliamentary assemblies, and the feudal organisation furnishes the key to their early constitution.

III. In the later feudal centuries trade and industry sprang up in the towns. In the absence of strong government, and under existing conditions as to communication and transportation, it was natural that the towns should not only be the centres of, but should secure control over, this new activity, and that they should seek to regulate it in their own interest. Thus, side by side with a manorial-economy, sprang up a town-economy; both to be superseded in later times by a territorial and a national economy. Under the sheltering care of municipalities and guilds arose a middle class, a *bourgeoisie*, by the side of, and after a time in a sense *between*, the two classes previously existing; and it is this class which has been the peculiar representative and champion of modern ideas in economic and constitutional matters.

[On the history of feudalism in Europe the most generally accepted authority of late has been G. Waitz, *Deutsche Verfassungsgeschichte* (last ed. 1880 *seq.*) This should, however, now be compared with Fustel de Coulanges, *Histoire des Institutions Politiques de l'ancienne France* (1889 *seq.*). For England the standard authority is Stubbs's *Constitutional History* (1873 *seq.*), a summary of whose conclusions as generally accepted in 1887 will be found in the essay on "Feudalism," in *Constitutional Essays*, ed. Wakeman and Hassall. Much information as to details of mediæval life will be found in the writings of Thorold Rogers, either in the *History of Agriculture and Prices* (vols. i. ii. 1866; vols. iii. and iv. 1882), or, in a more popular form, in *Six Centuries of Work and Wages* (1884). For Germany, Inama-Sternegg, *Deutsche Wirthschaftsgeschichte* (vol. i. 1879, vol. ii. 1891). On mediæval labour-rents light is thrown by Richard Jones in his *Essay on the Distribution of Wealth* (1831). The work of most vital importance for understanding the inner life of mediæval society is *English Village Community* by F. Seebohm (3rd ed. 1884). An endeavour is made to trace English agricultural development in Ashley, *Economic History*, (pt. i. 1888; pt. ii. 1893; in Amer. ed. vols. i. and ii.)]. W. J. A.

[See FORESTS, MEDIÆVAL; KNIGHT'S SERVICE.]

FIARS PRICES (Scotland). In the month of February every year the sheriff of every county in Scotland fixes, with the aid of a jury, the average local or "fiars" price of the different kinds of grain. The prices so fixed serve to regulate the money equivalent of all payments in grain, clerical stipends, grain-rents, or of payments stipulated to be in grain sold at fiars prices, or the price of grain stipulated to be delivered without any price having been fixed.

[See Connell, *On Tithes.*—A. Smith, *W. of N.*, I. xi. p. 84, 1, ed. M'Culloch.—*Add. Report of Lanarkshire Commissioners of Supply on Fiars of Grain*, 1817.—J. H. Maclean, *Fiar Prices and Produce Rents*, 1825.] A. D.

FIAT MONEY. A colloquial term in the United States applied to paper money issued by the government as money, but not supported by coin, bullion, or any promise of redemption. It circulates because the government wills it. The advocates of this money are in extreme opposition to the HARD MONEY or bullion party. D. R. D.

FIBONACCI (*filius-Bonacci*), LEONARDO PISANO (12th and 13th centuries), the mathematician of Pisa, chiefly famous for having introduced Arabic numerals from Barbary into Italy at the commencement of the 13th century, contributed materials to the history of currency and of commerce in his work on arithmetic, entitled: *Incipit Liber Abbaci compositus a Leonardo filio Bonacci Pisano in anno 1202.* In it an account is given of the various coins and their values, as well as of the different weights and measures used, when he wrote, at the principal cities of Italy. Extracts from it are given by Targioni Tozzetti (*Relazioni d'alcuni viaggi fatti in diverse parti della Toscana*, ed. 2; vol. ii. pp. 62-65, Firenze, 1768). C. A. F.

FICHTE, JOHANN GOTTLIEB (1762-1814). Fichte, though of the first importance as a philosopher, cannot be called an economist. Yet through his philosophy he has indirectly exercised great influence on economists, his system giving in outline the theory of development worked out by Hegel, and applied by certain of Hegel's followers to economic history and theory (see HEGEL, LASSALLE, MARX, PROUDHON). Yet the direct influence of Fichte, through his writings on social and

political questions, has been much less strong than might have been expected from the power of the writer and the brilliancy of his theories.

Fichte himself had two social ideals. (*a*) He looked forward to a condition of human society when the state and the coercion of laws would not be needed; as regards the remote future, he is what is now called an anarchist, of the type of William Godwin (*q.v.*). (*b*) But he sees that men have, strictly speaking, no rights without the state, and conceives that they must necessarily pass through a stage of development in which the state and the laws shall educate them. He has, therefore, a proximate ideal, an ideal state. The best state is to him a "closed state"; it is not merely to have its separate nationality and laws, but it is to be separate in its industry and wealth. It is not to be merely "protected" against its neighbours' competition; it is to have a cordon drawn round it, and, with a few jealously-watched exceptions, it is to have no trade and hardly any intercourse with the foreigner.

The cordon once drawn, the guardians of the state can, he thinks, regulate production and trading, prices and wages. They can introduce a *Landes-geld* or peculiar national currency, valueless abroad; and they can control its value by controlling its quantity. Thus in all departments of economical life there would be hope of introducing constancy, security, and the maintenance of the chief right of man, the right to labour. Fichte means by right to labour the same sort of exclusive privilege as was secured by the old gilds to their members; and he regards this as the most important form of property. Private property in the ordinary sense of the word, family life, and even accumulation of fortunes, are not excluded; and the advantages of family life are clearly recognised. Fichte is a socialist but not a communist; and he does not try to regulate consumption.

The fire of enthusiasm always present in Fichte's writings is not wanting in the *Closed State;* but the *Characteristics*, and *Vocation of Man*, are better examples of his best manner.

Collected works ed. by J. H. Fichte, Berlin, 1845-46 (8 vols.). There are passages of economic interest scattered up and down in nearly all these volumes. *Der Geschlossene Handels-Staat* (1800) was an appendix to the *Naturrecht* (1796). Both are contained in vol. iii. of works.

The *Characteristics of the Present Age*, *The Vocation of Man*, and other of the more popular works of Fichte were translated into English (with much spirit) by the late Sir William Smith (Chapman, 1848, etc.). The translator published also a *Memoir* of Fichte that went through two editions. Fichte's chief philosophical treatise is *Wissenschaftslehre* (1794), vol. i. of works.

Lassalle, *Die Philosophie Fichtes und die Bedeutung des deutschen Volksgeistes*, *Festrede*, May 1862; also the article *Fichte* in the *Handwörterbuch der Staatswissenschaften*, by Dr. Karl Diehl; also Bonar's *Philosophy and Political Economy* (1892), bk. iv. ch. ii.] J. B.

FICTITIOUS EXAMPLES. See Examples.

FICTITIOUS PAYEE. By § 7 (3) of the Bills of Exchange Act, 1882, which by virtue of §§ 73 and 89 applies *mutatis mutandis* to cheques and promissory notes, when the payee of a bill is a fictitious or non-existing person the bill may be treated as payable to bearer. This provision has been held to apply to the case of a forged bill, when the name of a real person was inserted as payee, but the bill was never negotiated, or intended to be payable, to him; see Bank of England *v.* Vagliano (1891), 1 App. Cas. 107; and see the whole subject discussed in an article on that case in *Law Quarterly Review*, vol. vii. p. 216. In France the insertion of a fictitious payee constitutes a *supposition de nom*, and makes the bill void in hands of any party with notice of the fact. Most of the continental codes contain similar provisions. M. D. C.

FIDEICOMMISSUM. A legacy by way of informal request instead of formal command, thus differing from the strict *legatum*. The fulfilment of the request at first depended entirely on the good faith of the person to whom it was made, but it subsequently became legally enforceable on any one who succeeded to property of the testator. The advantage of *fideicommissa* was, that being originally outside the law, they were not subject to the restricted rules applicable to *legata*. Thus many kinds of bequest were valid as *fideicommissa*, though invalid as *legata*. In course of time, however, the differences between these two forms of legacy disappeared, the law relating to them being assimilated. The idea of vesting property in one person in the confidence that he will allow another to have the benefit of it is common to the fideicommissum and the trust of English law. Indeed some writers suppose that the existence of fideicommissa suggested to mediæval chancellors the enforcement of uses and trusts. But the analogy is only of a general kind. A fideicommissum is simply a form of bequest requesting a transfer of property to be made by some one after the testator's death, whereas a trust is much more freely enacted and may be of much wider extent.

The notion of a double estate, legal and equitable, which belongs to trusts, being derived from the separation between common law and equitable jurisdiction, is foreign to fideicommissa. From the fideicommissum of Roman law a form of family settlement was evolved in France and some other continental countries by which the property affected by it was made inalienable in accordance with feudal ideas (see Majorat). E. A. W.

FIDES, BONA, MALA. These terms are frequently used in connection with the acquisition of property, a person acquiring the property of another *bona fide*, *i.e.* not knowing of his defective title, being sometimes in a more favourable legal position than one acquiring *mala fide*, *i.e.* knowing that he has no right. Thus according to Roman law only a person who comes *bona fide* into possession of the property of another can acquire ownership of it by usucapion, and in English law only a *bona fide* holder of a bill of exchange for value, not a *mala fide* holder, can recover on it. (See BONA FIDE.) E. A. W.

FIDUCIARY. A person entrusted with the management of property or business transactions on behalf of another person or other persons is said to stand in a fiduciary relation to the owner or owners of the property, or the person or persons on whose behalf the business is transacted. The more usual instances of fiduciary relations are those between trustees and beneficiaries,—principals and agents,—directors and shareholders. The nature of the responsibility varies according to the character of the relation, but the rule that a person standing in a fiduciary position must not, in the absence of special authority, derive any direct or indirect profit from his position, is common to all cases. E. S.

FIELDING, HENRY (1707-1754), playwright, novelist, and essayist, was made a justice of the peace "for the County of Middlesex and for the City and Liberty of Westminster," by the whigs, in return for his anti-jacobite journalistic writings. Some results of his magisterial experience took shape in two essays, which are not without interest to the economist from the historical point of view—*An Enquiry into the Causes of the late Increase of Robbers, etc., with some Proposals for Remedying this Growing Evil*, London, 1751; and *A Proposal for Making an Effectual Provision for the Poor, for amending their morals, and for rendering them useful members of the society. To which is added a Plan of the Buildings Proposed, with proper Elevations*, London, 1753.

"*The history of Jonathan Wild the Great*," says Mr. Leslie Stephen in his biographical essay, "is a powerful illustration of the facts which were going on under Fielding's nose." He was compelled to "set a thief to catch a thief," for "London at this period, and for long afterwards, was without any proper system of police. Although the population was close upon a million, the organisation for such purposes was still that of a country village. . . The weakness of the police, in fact, made it convenient for private persons to come to terms as best they could with the criminal classes," by means of advertisements promising silence if restoration of stolen property were made.

Fielding attributes the increase of theft (1) to the growth of luxury introduced by trade (and of which as such he approves), through which the working classes had become unsettled, idle, extravagant, and addicted to drunkenness and gambling; (2) to the abuse or neglect of the laws for the regulation of the poor. Neither the receivers of stolen goods nor the thieves were prosecuted with vigour, the tortuous mazes of London buildings favoured escape, conviction was difficult, pardons were frequent, and executions made festive, not solemn, as in Holland, but "a day of glory" for the criminal.

In the second essay Fielding insists—(1) that work should be provided for the poor; and (2) that the poor should be compelled to work. He descants on the burthen and nuisance they had become, gives an early instance of "slumming," and pointed out that there was no street in Westminster "which doth not swarm all day with beggars and all night with thieves," that open insults by day were frequent and depredations in the suburban parishes of nightly occurrence. He planned, with full regulations, a county workhouse and house of correction to contain at least 5000, to which vagrants and thieves should be sent, and to which the unemployed might go. There instruction should be given in "manufactures and mysteries," and a labourers' registry kept. In support of his principles, he quotes from Sir Josiah Child, "the great Mr. Law," and "Sir William Petyt." C. A. F.

FIELD SYSTEMS. The prevailing agricultural system, in the middle ages, of England as well as of many European countries. The enclosure acts of the 18th and 19th centuries finally put an end to it in most parts of England, but a few relics may yet be found. Open-fields and town-fields are names often given to lands cultivated under this "three-field" system. One of the three fields was left fallow each year, while the other two were under crops. In some cases a simpler two-field system existed. The open-fields were divided into strips, generally of an acre or some fraction of an acre, varying in breadth, but usually, except where the irregularity of the land prevented it, a furlong in length; evidently the shape was dictated by the necessities of ploughing. Balks of unploughed turf separated the strips, and across the ends ran a common way, sometimes a path, sometimes a strip, the last to be ploughed. The cultivators, whether freeholders, villeins, or copyholders, held a varying number of strips in each field; the demesne land of the lord of the manor, and probably even the church lands, were similarly scattered in strips in each field; the tenants paid rent, in early times chiefly in produce and in labour on the lord's strips, in the later middle ages and since, chiefly in money. Ploughing, sowing, reaping, carting, felling wood, washing sheep, repairing hedges, were among the commonest services performed by the tenants. These would come

under the head of week-work, usually the labour of three days a week from the ordinary serfs; other services, not fixed in time or amount, were called boon-work. In addition to their holdings in the fields the cultivators had grazing rights on the common pasture land which was never divided into strips like the arable, and also, as soon as hay-harvest was over, on the lands temporarily enclosed for hay by the several tenants. "Lammas meadows" (see LAMMAS LANDS) still recall this old right, which points to the common ownership originally existing in the village community. Another evidence of this is the communal or manorial rule, enforced by the township or manor courts, by which common cultivation was made compulsory. The same crops must be grown by all, the same fields cultivated and left fallow in the same order. Individual ownership was *practically* established, but there was no individual freedom of action. Economically, the system was wasteful, tending to keep the standard of farming at the level of the worst farmer, giving scope for endless quarrels, and preventing the adoption of improved methods and implements. The holdings being scattered, the farmhouses could not stand in the midst of the farms, but were placed side by side in the village street. The normal holding of the better class of villein, if in the complexity of classes and holdings anything can be called normal, may be taken to have been 30 acres,—a virgate or yardland; such a tenant usually owned two oxen, and combined with other tenants to form the common plough-team. Others held a half-virgate,—bovate or oxgang, and contributed one ox to the team, while others again of the lowest class of villein had little or no share in the common fields and owned no ox, but held a hut with a small plot of garden. All gradations are found between these classes, and some villeins even held more than a full virgate. The co-operative plough-team, like the compulsory common cultivation, calls to mind the common ownership of earlier times.

The chief points which are still controversial are, the origin of the scattered holdings and of the services and rents of the peasants. But the latter, though intrinsically the more important, cannot be considered here. With regard to the former, Seebohm argues that the strips were apportioned to the co-owners of the plough-team in a certain rotation, and in proportion to the number of oxen owned by each. Vinogradoff, contesting Seebohm's explanation of the problem by coaration, mentions the fact that in central Russia the strips are intermixed although the plough is drawn by one horse, and argues that the large landholders, who must have owned beasts enough for at least one full team of eight oxen, would under this theory have had compact holdings, which was not the case; and that very many instances are found of small teams of four oxen owned by two peasants, which under the system of distribution by coaration would have given the strips alternately to two tenants,—an arrangement which seems not to be found. Vinogradoff explains the intermixed strips by the desire to divide the land fairly; on the ground that, as due allowance for the uneven quality and irregular conformation of the land was nearly impossible, the plan of dividing good, bad, and indifferent land alike equally among the claimants, would be the most natural resource.

FIERI FACIAS, WRIT OF. This writ, commonly called *fi. fa.*, is the one most frequently used for the purpose of enforcing judgments for the recovery of money claims. It directs the sheriff to "cause to be made" (*fieri facias*) the sum of the judgment debt by sale of so much of the debtor's goods as are required for that purpose. The sheriff's officer must be careful not to seize more goods than are required, and not to seize goods which are not the debtor's property. It sometimes happens that goods seized by the sheriff are claimed by the debtor as his property as well as by some other person; in such a case the sheriff may have the rights of the parties ascertained by a procedure known by the technical name of Interpleader. Formerly the sheriff was unable to take possession of anything beyond "goods and chattels" in the strict sense, but a statute passed in the beginning of the present reign (1 & 2 Vict. c. 110) enables him to seize money, banknotes, bills of exchange, bonds, and other securities for money, and to enforce such securities in the judgment debtor's place.

E. S.

FIFTEENTHS AND TENTHS. The expedient of raising money by means of a tax on personal property is said to have been first tried in England in the time of Henry II. (reigned 1154-1189), who raised money for a crusade by means of the *Saladin tenth*. Whether this was the first occasion or not is a disputed point; it is, however, certain that as soon as subsidies began to be granted by parliament, these subsidies took the form of a tax on personal property. The amount levied was some definite fraction of the value of each person's movables; the inhabitants of cities, boroughs, and ancient demesnes being taxed somewhat more heavily than the rest of the country. In the reign of Edward I. (reigned 1272-1307), the usual grant became a *fifteenth and tenth;* that is to say, a tenth of the value of all movables was to be collected from the inhabitants of cities, boroughs, and ancient demesnes, and a fifteenth from every one else. At first a special assess-

ment was made for each grant, but in the year 1334, when a *fifteenth and tenth* was granted to Edward I., a great inquisition was held, the tax being assessed with much care, extraordinary pains being taken to secure an accurate result, and after this date a *fifteenth and tenth* was a technical expression, and meant that each district was to contribute the amount fixed by the great assessment of 1334. When, owing to changes in the distribution of wealth, the burden of taxation was no longer fairly distributed by the assessment of 1334, the balance was restored by allowing a drawback of £4000, and in later years of £6000, on each *fifteenth and tenth*, in favour of waste and impoverished places; but no new assessment was made till the reign of Henry VII. (reigned 1485-1509). The whole system of taxation was altered during the commonwealth, and *fifteenths and tenths* were levied for the last time in 1626. The accounts of the assessment and collection of these subsidies, extending as they do from the reign of Henry III. to the end of the reign of Charles I., form a class of documents of great importance in economic and general history.

[Stubbs, *Constitutional History of England*, vol. ii., Oxford, 1883.—Blackstone's *Commentaries on the Laws of England*, vol. i., London, 1862.—*Second and Third Reports of the Deputy-Keeper of the Public Records*, appendix ii.—Dowell, *History of Taxation*, 2nd ed., 1888.] A. E. S.

FILANGIERI, GAETANO (1752-1788), was born at Naples. His parents, nobles, intended him for a military career, which he soon abandoned to study law and philosophy, with a strong belief in the high future of science, and a desire to discover a new system for the good of mankind. He was the king's chamberlain, and passed his youth at court. During that time he supported the reforms which the Minister Tanucci introduced in the juridical administration (1774), and published, in 1780, the two first volumes of his great work, *La Scienza della Legislazione*, and soon after (1783) the 3rd and 4th vols., which, if they brought him honours both at home and abroad, brought him enemies also. He married, and removed to Cava, where he published (1785) three volumes more, and was appointed a member of the supreme treasury council by Ferdinand IV. His impaired health and zealous work in his new office obliged him to retire to the country at Vico Equense, to recover his strength. But in vain: he died suddenly, aged 36, leaving a lasting fame.

Filangieri was one of the most important writers on economics in the latter years of the last century. He did not, as he himself declares, create new systems, or any new theory; he had a considerable acquaintance with the economical studies of his time, but it is strange he knew nothing about Smith, whom he never refers to. However, he followed no leader, standing between the physiocratic and mercantile theories. He was a zealous partisan of free-trade and the SINGLE TAX, while he believed in the BALANCE OF TRADE; so that he may be termed eclectic, but not in the same sense as his fellow-citizen GALIANI. Filangieri is a connecting link between MERCANTILISM and FREE-TRADE; he sustains the principle of the balance of trade, but he argues for a system of liberty both for exportation and importation, tempered only by the opinion that laws ought to be different in countries differently circumstanced; his works are thus the prelude to a historical system of social legislation. In this aspect Cossa (*Introduzione allo studio dell' Economia Politica*) justly classes him among the authors who accept the new liberal theory without giving up entirely the ancient ones, physiocratic and mercantile.

La Scienza della Legislazione, Venezia, 1822, vol. ii. The 1st ed. is of 1780, and another at Genoa, 1798.—See especially lib. ii. *Delle Leggi Politiche ed Economiche*, reprinted by Custodi in his *Collezione P. Mod.* vol. xxxii.—*Parere presentato al Re sulla proposizione di un affitto sessennale del così detto Tavogliere delle Puglie*, Napoli, 1788.—*Estratto dell' opera* [*William*] *Playfair sul Debito Nazionale*, Napoli, 1788. Playfair's work is *An Essay on the National Debt*, London, 1787. Filangieri, in sending his work to the Marquis Tommasi, explains that he owed to Playfair his opinions against establishing a national debt, to meet the extraordinary requirements of the state. A. B.

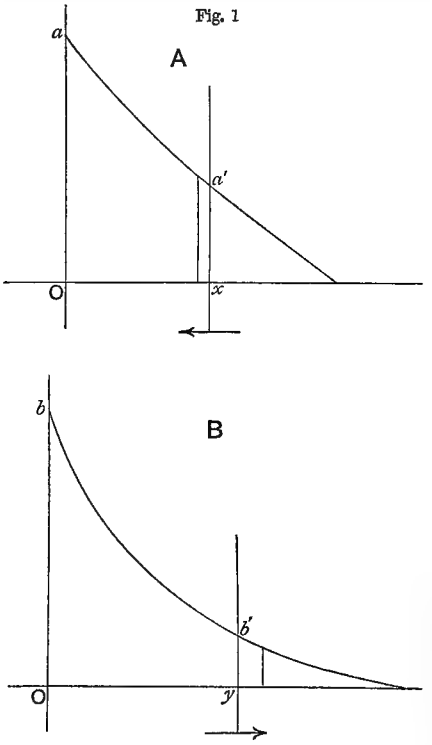
FILIUCCI, VINCENZO (18th century), a Jesuit, born at Siena, who summed up with intelligence the oft-repeated theological considerations about the determination of price, and discussed usury and exchange operations, faithfully keeping to the canon law. The first part of his volume treats of the theory of price, and is interesting to the economical student.

Moralium quæstionum de christianis officiis et casibus conscientiæ, auctore Vincentio Filiuccio, Lugduni, 1622. A. B.

FINAL DEGREE OF UTILITY is the expression used by Jevons for the DEGREE OF UTILITY (*q.v.*) of the last increment of any commodity secured, or the next increment expected or desired. The increments being regarded as infinitesimal, the degree of utility is not supposed to vary from the last possessed to the next expected. It will be obvious, after a study of the article on DEGREE OF UTILITY, that it is the *final* degree of utility of various commodities that interests us commercially, not, for instance, their initial or average degrees of utility. That is to say (Fig. 1), if a is a small unit of the commodity A, and b a small unit of the commodity B, and q_a the quantity of A I possess, and q_b the quantity of B I possess, then, in considering the equivalence of a and b I do not ask whether A or B has the greater initial degree of utility, *i.e.* I do not compare the lines Oa and Ob, nor do I inquire which has the greater average degree of utility, *i.e.* I do not compare the height of the rectangle on

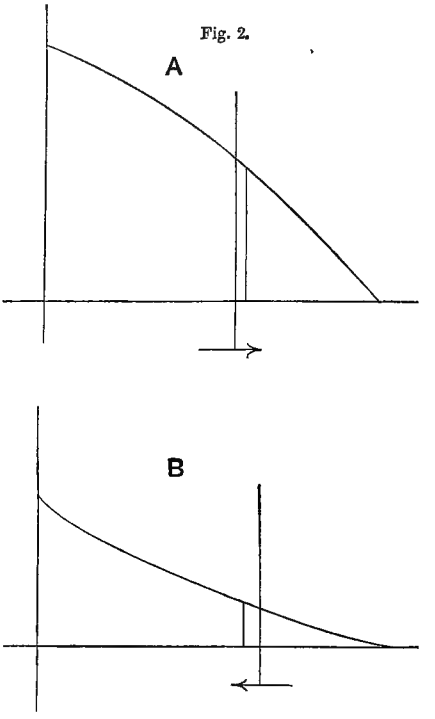
base Ox which shall equal the area $aOxa'$, with the height of the rectangle on base Oy which shall equal the area $bOyb'$, but I compare the length xa' with the length yb', and ask what are the relative rates at which increments of A and B will *now add* to my satisfaction. If xa' is twice the length of yb', then (since a and b are supposed to be small units, throughout the consumption of which the decline in the curves aa', bb' may be neglected) it is obvious that $2b$ will be equivalent to a, since either increment will yield an equal area of satisfaction.

Fig. 1



Now suppose (Fig. 2) that some other possessor of the commodities A and B, either because he possesses them in different proportions, or because his tastes and wants are different, finds that the relative final utilities of the small units a and b are not the same for him (2) as they are for me (1). Say that for him $3b$ is the equivalent of a, clearly the conditions for a mutually advantageous exchange exist. Let δ be greater than 2 and less than 3, so that $\delta - 2$ and $3 - \delta$ are both positive. Now suppose (1) exchanges with (2), giving him a and receiving from him δb. Then, (1) receives δb in exchange for a (worth $2b$ to him) and benefits to the extent of $(\delta - 2)\ b$, and by the same transaction (2) has received a (worth $3b$ to him) in exchange for δb, and has benefited to the extent of $(3 - \delta)\ b$. The result of this exchange will be a movement of all the verticals that indicate the amount of each commodity possessed by each exchanger, in the directions indicated

Fig. 2.



by the arrow-heads; and this again will (as is obvious from inspection of the figures) tend to reduce the difference between the ratio of equivalence between a and b in the case of the two exchangers. The process of exchange will go on (δ not necessarily remaining constant) until the ratio of equivalence between a and b coincides for the two exchangers, the last exchange bringing about an equilibrium in accordance with that ratio. Such a ratio of equilibrium is a limiting ratio of exchange; that is to say, exchange constantly tends to approach such a ratio, and would cease were such a ratio actually arrived at.

Hence follows Jevons's fundamental theorem: "The ratio of exchange of any two commodities will be the reciprocal of the ratio of the final degrees of utility of the quantities of commodities available for consumption after the exchange is completed."

The final degree of utility of a commodity is thus seen to be the same as its exchange value, and a precise relation is established between

(*q.v.*), the former being the differential coefficient of the latter.

The subject is worked out in an elementary and expository manner in Wicksteed's *Alphabet of Economic Science*, where Jevons is closely followed, but the term "marginal usefulness" is substituted for "final degree of utility."

The conceptions of "degree of utility" and "final degree of utility" lie at the heart of the mathematical method of political economy, and their complete history would almost coincide with the history of mathematical economics. Incidentally the idea has been struck from time to time by sundry mathematicians, and it has been worked out independently by economists no fewer than four or five times. COURNOT (1838), DUPUIT (1844), GOSSEN (1853), and JEVONS (1862 and 1871), successively discovered and taught the theory, each one in ignorance of the work of his predecessors. In 1871 the Austrian Menger, and in 1874 the Swiss Walras (working on the basis laid down by Cournot), adopted essentially the same central conception, and since then the theory has not again sunk into oblivion. Many writers in Germany, Holland, Denmark, France, Italy, and England are now engaged in developing it. See the bibliographies and lists of writers in the appendix to Jevons's *Theory of Political Economy*, 3rd ed., and the Preface to Walras's *Théorie de la Monnaie*, 1886.

[Jevons's "final degree of utility" is the *Grenznutzen* of the Austrian school, Gossen's *Werth der letzten Atome*, and Walras's *rareté* (see VALUE).]

Belgium, p. 68. France, p. 68. Germany, p. 71. Netherlands, p. 75. United States, p. 77—I. Revenue, p. 77, (*a*) Import Duties, p. 77, (*b*) Internal Revenue, p. 78; (*c*) Other Sources of Revenue, p. 78; II. Expenditure, p. 78; III. Debt, p. 79; State and Local Finance, p. 80; (*a*) Debts, p. 80; (*b*) Revenue and Expenditure, p. 80.

[The details of the taxation in each country must of necessity, in a work like the present, become rapidly out of date, but the examples of the methods of finance given will remain of service to the student of economics by showing him the manner in which the public revenue is raised in the countries cited, which have been selected as important instances of different methods.]

GENERAL PRINCIPLES. The word "finance," originally applied to the payment of a fine (*financia*, *finatio*), has by a series of changes come now to denote dealings with wealth or capital, most frequently, however, in respect to the management of public or state wealth. Public finance is in fact state housekeeping or "political economy" in the earlier sense of that term, which, according to Adam Smith (*Wealth of Nations*, bk. iv. ch. i. note), "considered as a branch of the science of a statesman or legislator, proposes two distinct objects," the second of which is "to supply the state or commonwealth with a revenue sufficient for the public services." It is accordingly concerned with the best methods of raising and applying the revenue of the state, with the administration of public property and debts, and finally with the systems of accountability and control. The forms and mode of financial organisation, and the principles on which it may best be carried on, have been gradually developed with the progress of political life and the growth of economic knowledge. The earliest societies show the direct levy of commodities and services from the members by the ruler. This simple method of supplying public wants after a time proves inadequate, and more complicated forms come into use. The sovereign obtains property sufficient to enable him to discharge the state services, or, as it was said, "to live of his own" (see DOMAINE), with the power of imposing taxes on extraordinary occasions. As the use of money in transactions becomes more general, the revenue is collected in the shape of coin, which is then expended for the public needs. It is regarded as the duty of the sovereign to accumulate treasure as a safeguard against emergencies, and the administrative arrangements for collection are improved and centralised. The sources of revenue are widened by the employment of various forms both of DIRECT TAXATION and INDIRECT TAXATION, the private or peculiar receipts from state property sink into a position of less importance, while on the other hand the forms of outlay expand with the increasing duties of the state. A further factor is introduced in the establishment of CREDIT, which allows of the substitution of borrowing (see DEBTS, PUBLIC) for the older plan of keeping a treasure. Credit also, by its use, as a medium of exchange, facilitates the collection and disbursement of the public receipts, which are readily managed through the banking system. Parallel with this movement is the application of a better and fuller method of AUDIT, and the greater power obtained by the people over finance, until, under the modern representative system, complete control has been given to the legislature over the appropriations for expenditure and the taxes laid for the obtaining of revenue. This stage, only reached by the most progressive nations within the last century, marks the highest type of financial organisation as yet known. The ruder and less developed forms still survive in backward countries, but their position only shows the course which progress has taken, and does not aid in the explanation of the best system of finance.

Theories on the subject of finance are of comparatively recent origin. At first the

financier's sole idea was to take possession of whatever articles were nearest to hand. The ulterior consequences of his action did not seem to need any consideration; therefore both in ancient and mediæval societies visible and accessible wealth formed the chief object on which the initial weight of the public burdens fell. Even high administrative organisation—as in imperial Rome—did not secure any wiser policy in the substantive methods of finance. Fiscal science took its rise with the need for increased outlay caused by the formation of the modern European system. "Statecraft," as understood by the rulers of the 16th and 17th centuries, included the management of national resources in the public interest. It therefore, more especially under the influence of the ideas of the MERCANTILE SYSTEM, sought to adjust financial rules in a way calculated to stimulate the growth of wealth. Not only the direct but the indirect effects of the fiscal policy adopted were taken, however mistakenly, into account. Thus in the *De Republica* of BODIN, certain kinds of taxation are preferred, and the rule of taxing according to "faculty" or "ability" is stated (bk. vi. ch. ii.). Modern maxims of finance in a crude form appear in the German writers of the 17th century on the subject of "the treasury," and in a more developed shape in the CAMERALISTIC SCIENCE of the succeeding one. The expediency of retaining, and the proper management of state property, the distribution of taxation, and the limits of its amount, the principle of public expenditure, and finally the questions of public treasures and debts are treated in his *Staatswirthschaft* (2nd ed. 1758), and his *System des Finanzwesens* (1761) by JUSTI who systematised the cameralist doctrines.

But the great source of financial principles in the scientific form has been POLITICAL ECONOMY (*q.v.*) as expounded by Adam SMITH (*q.v.*) and his successors, and either included, as in England, in the usual text-books of the science, or, as mostly in Germany, considered in a distinct department with the title *Finanzwissenschaft*. In the midst of much difference of opinion and dispute on controverted points some general principles may be found that have commanded widespread acceptance, or at least enable the opposed views to be realised and defined. Taking the several departments of finance in what seems their natural order, public expenditure first presents itself. The broad rule on this head is admittedly that of "economy." No expenditure should be undertaken unless for an adequate object, and the utility to be gained should be carefully balanced against the disutility or cost of the service. Not only must the total state outlay be weighed against the total sacrifice involved in the raising of revenue, but a due proportion between the several wants to be satisfied must be also observed. The "necessary" functions of the state should be met before what J. S. Mill (*Principles*, bk. v. ch. i. § 1) calls the "optional" ones receive attention. "Defence," to adopt a phrase otherwise used by Adam Smith, is prior to "opulence," and therefore expenditure for security comes before that for the encouragement of industry or the improvement of art. The rule of "economy," or perhaps better, "maximum utility," holds in respect to each class of outlay. There are limits beyond which even the most necessary object cannot be wisely pursued; and most disputes as to particular cases of expenditure,—*e.g.* the recurring one as to the sufficiency of the English army and navy—turns on the question of the observance or breach of this rule, which in practice only admits of a rough empirical application. The expediency of increasing or reducing state action may theoretically be regarded as coming under the same comprehensive canon. It should be carried up to and not pushed beyond the point at which the distribution between public and private activities produces the maximum advantage. In this respect the doctrine of FINAL DEGREE OF UTILITY (*q.v.*), promulgated by JEVONS (*q.v.*), and Menger has been employed by Mazzola (*Finanza Pubblica*, Rome, 1890), Viti de Marco (*Economia Finanziaria*, Rome, 1888), and others, but owing to the complications of the factors, it seems as yet impossible to get any definite results. On the lower plane of practice the prudence and insight of the statesman form the only guarantee for successful treatment. Other laws of expenditure are those laid down by Prof. Wagner (*Finanzwissenschaft*, vol. i. pp. 76-83, 3rd ed. 1883) as (1) the law of increase in state functions with the progress of society, and (2) the preference of prevention to repression in modern state-action. These, however, are bare generalisations from the specific experience of Germany (and in a less degree other states) during the present century rather than fundamental laws of financial policy.

Of the two great classes into which the public receipts are divided, the older, "drawn from some fund which peculiarly belongs to the sovereign" (*Wealth of Nations*, bk. v. ch. ii. 1st paragraph), may consist of lands or industrial property. The weight of authority represented in Adam Smith's dictum that "the revenue which, in any civilised monarchy, the crown derives from the crown lands . . . in reality costs more to the society than perhaps any other equal revenue which the crown enjoys" (*Wealth of Nations*, bk. v. ch. ii. part 1), favours the sale of public lands, in European countries at all events, and is opposed to fresh purchases. Any exceptions, *e.g.* the case of FORESTS (*q.v.*), are made not on financial grounds, but for reasons of public policy. As a necessary result the revenue derived from this source is quite insignificant. The question of retention or

appropriation of rent by the use of taxation is treated under LAND, NATIONALISATION OF (see also SINGLE TAX).

Though the industrial receipts of the state are not declining as much as those from the DOMAINE (*q.v.*), yet up to the present the field of public enterprise is a limited one, being confined to the means of communication and transport (see POST OFFICE; RAILWAYS, STATE; TELEGRAPHS), certain municipal services, as waterworks, gasworks, and tramways, and lastly industries monopolised for the purpose of securing revenue (MONOPOLIES, *q.v.*). The contribution from this source is comparatively small owing to the great disparity between net and gross receipts. Any considerable gain, as in the instances of the English post office, and (till quite lately) the Prussian railways, is in fact a covert form of TAXATION (*q.v.*). The relatively small yield of the quasi-private or "peculiar" sources of revenue, together with the increasing expenditure for public purposes, compels recourse to a larger extent to the agency of TAXATION.

The nature and general features of TAXATION, its just division, and its real pressure on those affected, as well as the technical rules for its convenient and economical levy, belong to the articles assigned to that head (TAXATION; TAXATION, EQUALITY OF; TAXATION, INCIDENCE OF; TAXATION, MAXIMS OF, *q.v.*). There are, however, some financial principles applicable to the subject of revenue as a whole, which may best be considered here.

One very important rule has been expressed by the word "sufficiency," *i.e.* the public revenue should be large enough to meet the public wants (Wagner, *Finanzwissenschaft*, vol. ii. p. 307, 2nd ed.). No methods of taxation or fiscal management generally—no matter how perfect in other respects—are financially sound unless they provide funds sufficient to meet all usual expenses, and thus obviate the creation of a DEFICIT (*q.v.*). Productivity is therefore one of the essential qualities of a good tax system, and the net amount produced is a most material element in determining the imposition or remission of a tax. As a corollary from the principles on which the foregoing rule is based, it may be said that excessive revenue is not desirable. A large surplus leads to waste and profusion. As Prof. Adams (*Public Debts*, pp. 81, 82) remarks, "The full realisation of self-government requires a delicate adjustment of budgetary machinery, but surplus revenue acts as a weight which throws that machinery out of balance." Thus the ideal system is one in which receipts and outlay are completely balanced, provision for repaying debt being regarded as normal expenditure.

Closely connected with the rule of "sufficiency" is that of "elasticity." Adjustment of revenue in accordance with changes in expenditure should always be within easy reach. Were this not so it would be impossible, owing to the fluctuating nature of public expenditure, to secure the desired balance. For this purpose the best expedient is the general INCOME TAX (*q.v.*) at a movable rate, as in England. The return from such a tax can be predicted within narrow limits, and the yield "begins almost at once" (Blunden, *Econ. Journal*, vol. ii. p. 642). Increase of duty on lightly-taxed articles in general consumption supplies the best substitute for, or (where a large increase in revenue is wanted) the best auxiliary to, the income tax. Abnormal pressure that cannot be easily met by state agencies must be discharged for the time by borrowing (see DEBTS, PUBLIC) which is practically a distribution of the burden over a longer period.

In addition to these requirements of financial policy, it is further desirable that the rules of "generality" and "equality" should be as far as possible observed. The former—flagrantly violated in the case of the privileged classes in France under the *ancien régime*—prescribes that all citizens should contribute to the public services. "Every privilege that tends to exemption from that contribution is" says Vauban, "unjust and abusive" (*Dîme Royale*, ed. Daire, p. 48). The latter rule, though admitting of various interpretations (see TAXATION, MAXIMS OF), lays down that: "The subjects of every state ought to contribute towards the support of the government as nearly as possible in proportion to their respective abilities" (Adam Smith, *Wealth of Nations*, ed. Nicholson, p. 347). Quite apart from ethical or political reasons, it is financially advantageous to secure the contributions of all citizens, and to avoid placing an undue burden—or even what may plausibly be regarded as such—on any individual or class.

Given the foregoing general principles as guiding rules in organising a financial system, it becomes a question of art to duly apply them in the most effective way. First it must be decided whether a SINGLE TAX (*q.v.*) will obtain the needed amount, and if so what form it should take; whether on land, on Revenue, or on Capital (see TAXATION). As, however, both theorists and practical men are agreed in favouring the use of more than one tax or form of tax, the selection and combination of the most suitable classes of imposts have to be considered. To what extent INDIRECT TAXATION (*q.v.*) should be employed; how it should be counterbalanced by DIRECT TAXATION (*q.v.*), and the supplementing of these main categories of revenue by other taxes, are the most important points for notice. At first, and even now to a great degree, indirect taxation in the shape of duties on commodities (CONSUMPTION, TAXES ON, *q.v.*) was the prevailing method. Imported goods were subject to

CUSTOMS DUTIES (*q.v.*), and the European monarchies generally employed the EXCISE (*q.v.*). Customs and excise combined furnish by far the largest part of the revenue of the UNITED KINGDOM (FINANCES OF), of the UNITED STATES (FINANCES OF), and of most other countries. In the first-named they are confined to a very small number of articles, but being laid exclusively for revenue, their yield is high. Elsewhere the inclusion of a much greater number does not give any substantial increase in the return, partly because customs duties are arranged with the design of giving PROTECTION (*q.v.*) to native industry, partly in consequence of the limited consumption of minor articles, the DEMAND (*q.v.*) for which is besides more elastic, and therefore easily reduced by taxation. Good policy, moreover, requires the freedom from taxation of certain classes of articles. Thus taxes on raw materials, and on absolutely necessary articles of food, are not levied in England; as the former would hamper industry, and the latter trench on the MINIMUM OF SUBSISTENCE (*q.v.*). Articles of luxury, particularly if hurtful, have since the time of Bodin been regarded as specially suitable objects for fiscal treatment, as the almost universal heavy taxation of alcohol and tobacco bears witness. Co-ordination between the excise and customs is desirable in order to avoid diversion of the course of industry or disturbance of the natural movements of consumption. The use of protective import duties or excises unbalanced by corresponding customs is equally a violation of this condition. Nor should articles for which substitutes free from duty are obtainable be subjected to taxation, and the actual duties imposed should be suitably arranged in respect to objects of interchangeable use, as *e.g.* beers, wines, and spirits, or tea, coffee, and cocoa.

Direct taxation is gradually taking a large place in the financial system. The English INCOME TAX (*q.v.*), at first extraordinary and exceptional, has become in practice permanent. The DEATH DUTIES have been increased and are much more productive. The extended use of the income tax on the continent, as in Prussia and the other German states, and in Holland, with in many cases a progressive form (see PROGRESSIVE TAXATION) are instances of the same tendency. Taxes on property, as in Switzerland, the "state" taxation of the American Union, and quite recently in Prussia, may be further cited. On the whole it appears that both income and realised wealth, especially when passing by succession, are being made to bear a greater proportion of the increased public expenditure of modern societies. By this change a partial shifting of the burden involved in supporting the state from the consumers of ordinary commodities to the recipients of the higher grades of income and the holders of realised wealth is being gradually produced.

Some other kinds of contribution are employed by the financier. By the agency of stamps, various legal and commercial transactions are charged. Of the same character are the fees for legal formalities, and more generally for services rendered by the public departments, which in some degree differ from taxes, since they are paid for service done. In their case the rates of charge have to be fixed on other than purely financial grounds.

In the working of finance it is difficult and indeed practically impossible to avoid excess of expenditure over income in periods of great pressure. Hence the growth of Public Debts (see DEBTS, PUBLIC), and the need of providing for their support and ultimate discharge (see AMORTISATION; SINKING FUND).

The systematic treatment of national finance is facilitated by the exhibition of its true position at definite intervals, and its consideration by the legislature. This is secured by the BUDGET (*q.v.*), round which has gathered a mass of conventional rules as in England, or strict legal enactments as in France, designed to secure publicity and responsibility. A thorough system of audit, verifying both the reality of alleged expenditure and its conformity to the legalised appropriations, is an additional and valuable guarantee for the sound management of the public finances.

Lastly the existence of a complementary system connected with the numerous local bodies both urban and rural must be noticed. Each of the several heads touched on above—expenditure, revenue, indebtedness, and administration—has its counterpart, though with instructive differences in LOCAL FINANCE (*q.v.*). But it is the reciprocal action of the tax system that requires to have special emphasis placed on it. When estimating the legitimacy of outlay, the distribution and proper forms of taxation, the weight of public debt, or any similar questions, it is absolutely necessary to take both general and local finance into account. Otherwise a true judgment on such points will be impossible, as some elements essential for its attainment will have been omitted.

[The literature of finance is quite overwhelming in amount. Nearly all text-books of political economy deal more or less with financial questions. There is also a mass of special works. In addition to those quoted in the text or given in the various articles referred to, the following manuals may be mentioned. M'Culloch, *Taxation and the Funding System*, 1845, 3rd ed. (revised) 1863.—Thorold Rogers, art. "Finance" in 9th edition of *Encyclopædia Britannica*.—P. Leroy-Beaulieu, *Traité de la Science des Finances*, 2 vols., Paris (5th ed.), 1892.—W. Roscher, *Finanzwissenschaft*, the 4th vol. of his *System der Volkswirthschaft*, 3rd ed., Stuttgart, 1889.—G. Cohn, *Finanzwissenschaft*, (translated into English), Stuttgart, 1889.—C. F. Bastable *Public Finance*, 1903.

Among brief introductory text-books the most

convenient are L. Cossa, *Scienza delle Finanze*, 6th ed. 1893, the 3rd ed. translated into English under title *Taxation*, New York, 1888.—G. Ricca-Salerno, *Scienza delle Finanze*, Florence, 1888.—K. J. Eheberg, *Grundriss der Finanzwissenschaft*, 3rd ed. Leipzig, 1891.] C. F. B.

UNITED KINGDOM. In the articles on the BUDGET; EXCISE; and FINANCE, GENERAL PRINCIPLES OF, reference has been made to the historical development of the British financial system. Those on IMPORT DUTIES and the MERCANTILE SYSTEM explain its connection with the industrial development of the nation. The purpose of this article is to state broadly existing facts, and the principles on which the finance of the United Kingdom is at present based.

I. IMPERIAL FINANCE.

The following table indicates the growth of the resources of the kingdom since the beginning of modern finance—the time of the corn law repeal. It should be compared with the general growth of the nation's wealth—*e.g.* with the IMPORTS and EXPORTS. About 1887 a check seems to have come to the then sources of revenue; and the great increase in amounts appearing in more recent years is due to extra taxation.

	Revenue.	Expenditure.
1842	£46,965,630	£50,945,169
1847	51,546,264	54,502,948
1852	53,210,071	50,792,512
1857	72,787,965	76,042,570[1]
1862	69,674,479	72,086,485
1867	69,434,568	66,780,396
1872	74,708,314	71,490,020
1877	78,565,036	78,125,228
1882	83,955,229	83,605,503
1886–7	90,772,758	89,996,752
1891–2	90,994,786	89,927,773
1896–7	103,949,885	101,476,669
1901–2	142,797,999	195,522,215

[1] War expenditure.

a. Revenue.

The approximate percentages in the revenue table are:—

	Yield in 1904-5.	Per cent of whole, approx.
Customs . . .	£35,730,000	24¾
Inland Revenue—		
Excise . . .	30,750,000	21¼
Estate Duties, etc. .	12,350,000	9
Stamps . . .	7,700,000	5½
Land Tax, etc. .	2,750,000	2
Property and Income Tax . . .	31,250,000	21½
Postal and Telegraphic	19,930,000	14
Crown Lands . .	470,000	⅓
Miscellaneous . .	2,440,404	1⅔
	£143,370,404	100

Though the actual receipt of this revenue is, of course, not so simple as might appear from this table, it is immeasurably more so than in any foreign country of which we are aware. Taking the heads in order, we may bring out a few further details.

The customs (import) duties are raised on about seven chief articles:—

Tea	which gave in	1904-5	£8,271,866
Coffee	,,	,,	179,485
Spirits	,,	,,	3,822,196
Wines	,,	,,	1,185,508
Tobacco, etc.	,,	,,	13,184,767
Currants, etc.	,,	,,	442,062
Sugar	,,	,,	6,106,387

The process by which this purely revenue tariff has been attained will be found sketched in the articles on COMMERCE; FREE TRADE; and IMPORT DUTIES. For about twenty years it remained much the same and produced annually about £20,000,000. Its recent increase may be described as due to the war taxation, and is in great measure the result of the duty re-imposed on sugar in 1901.

The excise remained fairly constant, varying from £25,000,000 to £27,000,000 for many years; it has been increased lately. The chief items in 1904-5 were—

Spirits . . .	£17,306,983
Beer . . .	12,678,832
Railway Tax . .	354,891

The spirit and other licenses, which up to 1889 produced £3,500,000 for general revenue, were in that year, all but a small portion, handed over to the local authorities. It is only since 1881 that an excise duty has been levied direct on beer—previously it was imposed on the materials used for brewing.

The death duties, since 1894, when Sir W. Harcourt recast and increased them, have been separated from "stamps"—producing a large revenue. The property and income taxes and the inhabited house duties are amongst the most important items in the national taxation. The income tax is at once the most convenient and the most notoriously unfair. Originally imposed as a temporary expedient, it has become one of the chief engines in the hands of the chancellor of the exchequer. A penny in the pound on the income tax produces a sum which may now be put at £2,500,000, but tends to increase with the wealth of the country, and the care taken in collecting the tax. The principle of the tax is excellent, but, as levied, it excites a good deal of grumbling and invites evasion. If it were arranged on a scientific basis, it would be more satisfactory and productive. The main burdens on houses and land belong to local finance.

The revenue of the postal and telegraph services are the other large items in the public revenue. They are rather to be considered as

returns for services rendered. The net revenue on this account, after deducting expenses, averaged over £4,000,000 for five years past: obtained almost entirely on the inland post.

The incidence of the above taxation, which is an important point for the financier, will be found on examination to be in a marked degree heaviest on the middle classes, *i.e.* persons of moderate means: it bears much more lightly on the working classes and the very wealthy.

Before passing to expenditure, it is well to explain that the term CONSOLIDATED FUND (*q.v.*), originally used in its proper sense, has, owing to the great changes in the raising of revenue, come to be practically a term earmarking that expenditure which was originally assigned to the fund—notably, the charges of debt and the salaries of the judges.

b. Expenditure.

The expenditure may be classified under the heads—

Charges of Debt	£27,000,000	in 1904-5 or	19%
Civil Administration	14,607,902	„	10%
Payments to Local Accounts	1,156,867	„	¾%
Education	14,235,728	„	10%
Naval and Military	66,270,000	„	47%
Collection of Revenue	3,093,000	„	2¼%
Postal, etc., Services	15,593,000	„	11%
	£141,956,497		100

The article on DEBTS, PUBLIC, gives a sufficient view of the history of the English debt. The chief points for the financier to consider are the weight of its burthen and the permanency of its charge. Sir R. Giffen, some years ago (*Essays in Finance*), pointed out that it would not require an insupportable effort to pay off, in a few years, a burthen which is less than half the national income. But English financiers have preferred more gradual measures. The annual charge was diminished by about £4,000,000, through Mr. Goschen's conversion in 1888, and again by the falling in of terminable annuities in 1900. But the South African War brought it up again. Taking debt as the cost of past wars, and our naval and military expenditure as the cost of insurance against the future, we have the enormous sum of £93,270,000 annually as the result of national jealousies—about double the charges of administration.

Of the fighting expenditure the army took materially more than the navy up to 1894; in 1904-5 it took £29,000,000 against £36,830,000. This expenditure is one of the most anxious subjects with which the chancellor of the exchequer has to deal, the economy of British administration in this respect having been seriously impugned. Of civil administration the chief items on the accounts for 1903-4 were—

Public Works and Buildings	£2,554,645
Civil Departments	3,006,366
Law, Police, Prisons, etc.	4,552,030
Diplomatic Service, etc.	619,639
Colonial grants in aid	1,514,144

From this it will be seen that the administration as a rule is fairly economical, though it has risen enormously in the last ten years: the expenditure in connection with the colonial empire has been multiplied ten times owing to the African protectorates, for most of the British colonies are altogether self-supporting. On the other items we need only remark that education is an annually increasing charge—it has almost trebled in fifteen years—and that the cost of collection of revenue is moderate.

The control of this expenditure is secured by the audit department, and by the annual investigation of the public accounts committee appointed by the House of Commons.

A word may be given to the actual financing of the United Kingdom. Although a large balance is kept in the exchequer, it is constantly necessary to borrow in advance of revenue for short terms, in order to meet the regular demands of expenditure. This necessarily gives rise to EXCHEQUER BILLS, etc.

II. LOCAL FINANCE.

Some years ago Mr. Goschen described the local finance of the United Kingdom as a complete chaos. The chief sources of receipt for the purposes of local expenditure are the rates on houses and property, reimbursements for gas and water supplied, and various tolls and dues in markets and otherwise. Some of these last, *e.g.* the toll on fish coming into Billingsgate Market, are objectionable as being practically an *octroi* on food.

The total receipts of local authorities have more than doubled since 1892; for 1902-3, exclusive of loans from or under the control of the central government, they were £93,935,417, of which more than half, £50,328,412, was from rates; the amount of government contributions was £12,782,803.

The expenditure of these sums fell under the following chief heads:—

Poor Relief in the Parishes	£13,609,870
Municipalities—Police and General Administration	79,995,031
Counties—Police and General Administration	7,735,530
School Boards, etc.	13,488,433
Highway Boards, etc.	2,183,270
Harbour, Pilotage, etc.	4,819,498

These amounts include loan expenditure.

The average annual expenditure on local purposes has grown till it approaches that of the general government, so that the total burthen of public expenditure on the people of

Great Britain is at present about £235,000,000. (For further details see LOCAL FINANCE.)

[The great parliamentary return 366 and 366-1 of 1868-69, often called *Chisholm's Analysis.*—The *Statistical Abstract of the United Kingdom.* —Reports of the Public Accounts Committee, etc., etc.] C. A. H.

COLONIAL AND INDIAN. Finance is a wide term, somewhat indefinitely used; and in a short article it will not be possible to do more than indicate briefly the basis on which the finances rest in the British possessions. The general objects of the public expenditure of all these possessions are much the same: civil and judicial administration requires a considerable fund; public works are usually the most important item apart from this; services for the public benefit, such as post offices and railways, in some cases form a large item. In many colonies and India the charge for debt is heavy. The point of view from which it is most interesting to examine the finances of each possession is that of the method of raising the revenues; and the different methods in vogue lend themselves to a rough classification.

(1) Import duties have a very decided preponderance in many colonies: *e.g.* Canada, Newfoundland, the West African Colonies, the West Indian Colonies; also West Australia.

This is illustrated by the following figures:—

	Total Revenue, 1903-4.	Revenue from Customs.
Canada (Dominion) .	£14,526,573	£8,366,647
Newfoundland . .	516,691	464,157
West African Colonies .	1,387,096	809,234
Jamaica . . .	883,450	349,576
West Australia . .	3,978,468	1,094,845

This method of raising revenue was usually the easiest and adopted first (see IMPORT DUTIES): in colonies where great natural resources have not recently been developed, the customs revenue still remains the mainstay of the financier, and in most temporary emergencies the resource is an addition to the customs duties, often merely to the *ad valorem* duties. In the West Indian colonies there have from time to time been proposals to lighten the customs dues and replace them to that extent by direct taxation; but these proposals have had little success.

(2) In several of the colonies, while the customs revenue forms a very important item, there are others which run it close in point of yield. Such are almost all the Australian colonies, the Cape, the Mauritius, Falkland Islands, and Fiji. The competing items vary so much that it would be difficult to make a classification which was not cumbrous. Excise and liquor licenses in some cases, and land revenue of different kinds in others, are the chief sources. Indeed, it is true of many colonies in the first group above indicated that excise is an important item.

(3) In a few colonies, the chief of which are the Australian, land and royalties on minerals and timber contribute a substantial amount to the annual revenue; in the Falkland Islands the rental of crown lands produces nearly half; in India the land revenue is the mainstay of the finances, producing in 1903-4 over £20,000,000 out of £83,750,000, and more if the indirect sources of revenue from land, as timber royalties, etc., be included.

(4) Revenue from public works, generally railways, swells the total considerably in many colonies. Natal is perhaps the best instance, where under this head the accounts have almost £2,500,000 out of £4,160,145 in 1903-4. But the item requires careful scrutiny in all cases, in the light of the corresponding expenditure under the other side of the account, and very often of the charge of debt. It may be said generally that in no place at present is there a net revenue from such works.

The most satisfactory form of revenue is doubtless that derived from land. It is on this ground that Strachey (*Finances of India*, ch. i.) claims that India is one of the least heavily burdened countries in the world. It is a good policy to keep the land as far as possible in the hands of the state or under some sort of state control, and in her colonies, England, applying traditions from her own history, has only slowly realised this. Most colonial governments have parted with the freehold of the land, and have sold, or granted, rather than rented it; afterwards, when fresh need of revenue has arisen, they have had recourse to taxation.

Various methods of raising revenue in the British possessions have of late years been the object of attack in this country—notably the opium and salt revenues of India, and the paddy tax in Ceylon. For the controversies which have raged round the import duties, see article on IMPORT DUTIES. Tonnage dues are generally disappearing. Besides the customs, the most thoroughly established methods of raising revenue are by excise, spirit and still licenses, stamps, and taxes on land and houses,—all of which are very general.

An important factor in the finance of all countries is their public debt; in nearly all the colonies the debt has been contracted for works of public improvement, which should eventually not only pay the charges of debt, but yield a revenue beyond; in the case of the crown colonies the debts will be repaid within a limited period, leaving the colonists with valuable assets in the completed works for which the loans were raised. In some of the more important colonies, especially the Australian, the charge for debt is large even in proportion to revenue and population; in the smaller colonies it has been kept comparatively light.

In India, Mauritius, the eastern colonies, and some others, the presence of a silver currency has introduced special difficulties of finance.

The control of finance is entirely in the hands of the local government in colonies with responsible government; in the other colonies it is supervised generally, and in the crown colonies very carefully, by the imperial colonial office. C. A. H.

BELGIUM. (Amounts in francs converted as 25 = £1.) According to the thirty-fifth volume of the *Annuaire Statistique de la Belgique*, published by the ministry of the interior, the total actual receipts of the state in 1903 were subdivided as follows:—

	Millions of francs.	£
Taxation (*a*)	239	9,560,000
Péages (tolls) (*b*)	241	9,640,000
Income of State Property	18	720,000
Reimbursements	6	240,000
	504	£20,160,000
Extraordinary and Special Resources	123	4,920,000
	627	£25,080,000

(*a*) Taxation.—The principal items are—

	Millions of francs.	£
Contribution foncière (on real property)	26	1,040,000
Contribution personnelle	22	880,000
Patentes (Trade Licenses)	10	400,000
Customs	42	1,680,000
Excise[1]	71	2,840,000
Registration, Stamps, etc.	41	1,640,000
Donation and Death Duties	22	880,000

(*b*) *Péages* (tolls) comprise the gross proceeds of the State Railway

	213	8,520,000
Post Office	18	720,000
Telegraphs	10	400,000

The extraordinary receipts consist mainly in the proceeds of public loans.

For the same year the actual expenditure was—

	Millions of francs.	£
Interest on Public Debt	136	5,440,000
Dotations (Civil List)	5	200,000
Ministry of Foreign Affairs	3	120,000
Ministry of Agriculture	12	480,000
Ministry of Railways, Post and Telegraph	165	6,600,000
Ministry of Finance and Public Works	36	1,440,000
Ministry of War	62	2,480,000
Ministry of the Interior and Public Instruction (the latter 21 millions, £840,000)	33	1,320,000
Ministry of Justice (includes 7 millions for religious endowment)	27	1,080,000
Ministry of Labour and Industry	17	680,000
Sundries	4	160,000
	500	£20,000,000
Special Services	114	4,560,000
	614	£24,560,000

[1] Includes Foreign wines 5 (£200,000), alcohol 45 (£1,800,000), beer and vinegar 12 (£480,000), sugar 6 millions of francs (£240,000).

Special services include public works executed at the expense of the state; thus, from 1834 to the end of 1903, 2099 millions of francs (£84,000,000) have been spent on railways owned by the state.

The subdivision of administrative functions between the different ministries is not exactly the same as in France; the separate ministry of railways was created in 1884, and is justified by the fact that the Belgian state owns the greater part of the railway lines—4025 kilometers, or say 2500 miles against 531 kilometers, or 330 miles worked by companies in 1903.

The Belgian financial system has much the same basis as the French system (see below). Taxation, however, is much lighter, since the net proceeds of the state railways ought to be deducted and the amount paid per head in taxation is not one-half of what it is in France. State monopolies do not exist; there is no tax on the income, and the custom duties are generally arranged with a purely fiscal aim.

Belgium has no *universal* budget, and its finance presents one particular feature. Since 1859, the *octrois* or municipal duties on consumption levied at the entrance of the towns (see OCTROI) have been suppressed, and a special fund, called the *Fonds Communal*, instituted to compensate the loss to the municipalities. This fund is provided for by a fixed percentage on the proceeds of the postal receipts and of certain excise or custom duties (sugar, coffee, alcohol, wine, and beer). This distinct attribution to local purposes of a specified part of the general national revenue constitutes an exceptional departure from the leading principles in Belgian and also French finance.

The Belgian public debt amounts to about 3000 millions of francs (say £120,000,000 sterling).

[Apart from official publications such as the *Annuaire Statistique* already mentioned, the *Moniteur Belge*, and the *Comptes Généraux de l'Administration des Finances*, much information concerning Belgian finance will be found scattered over M. P. Leroy-Beaulieu's *Traité de la Science des Finances*, and also occasionally in the French official *Bulletin de Statistique*. For the period 1830-70, a general sketch was published in the *Patria Belgica* (vol. ii. *Belgique Politique et Sociale*, pp. 865-903), Brussels, 1873. The English reader may be referred to Messrs. Le Hardy de Beaulieu, and Couvreur's contributions to the *Correspondence relating to the Budgets* published by the Cobden Club. See also Ernest Dubois, *Étude sur le système belge en matière de budget de l'État*, Paris and Brussels, 1904.] E. Ca.

FRANCE. (Amounts in francs converted as 25 = £1.) Practically it is only since the time of Napoleon I. (first consul 1799, proclaimed emperor 1804), that regular estimates of receipts and expenditure have been yearly prepared; and only since the restoration of

the Bourbons (1814), that these have been submitted to the effective preliminary approval of the French parliament. The *Budget des Voies et Moyens* (ways and means) is drawn up by the minister of finance; the *Budget des Dépenses* (expenditure) by each minister for his own department; it is divided into chapters, corresponding to each particular branch of the service, and since 1871 each chapter must be voted separately. The vote opens a *crédit* (supply) to the minister, who is now no longer allowed, as under the second empire, to effect transfers (*virements*) from one chapter to another. In case of need, *additional credits* are granted after the vote of the *budget;* these sometimes reach a considerable amount (15 millions sterling in 1885), and are a permanent cause of instability in the financial equilibrium. The whole of the expenditure and receipts must be voted yearly, and first by the lower chamber.

RECEIPTS.—In the *Rapport sur le projet de loi portant fixation du budget général de l'Exercice 1906*, the total estimates amount to 3704 millions of francs (£148,160,000). The main elements of this revenue are given as follows in millions of francs and round numbers:—

	francs	£
Direct taxation	554 mill.	22,160,000
Indirect taxation	2044 ,,	81,760,000
State monopolies and manufactures	842 ,,	33,680,000
State property	61 ,,	2,440,000
	3501 mill.	140,040,000

The words "direct" and "indirect taxation" are, of course, used in their French administrative and purely empirical sense, without regard to the ultimate incidence of the tax itself.

Direct taxation includes, for instance, taxes on clubs, royalties paid by mines and collieries, and the *contribution des Patentes*, or "trade licences."

The principal direct taxes are the—

		francs	£
Contribution foncière (Tax on real property)	Buildings	92 mill.	3,680,000
	Land	105 ,,	4,200,000
Contribution personnelle et mobilière (personal taxes and on house-rent)		101 ,,	4,040,000
Doors and windows		66 ,,	2,640,000
Patentes (trade licences)		138 ,,	552,000

It may perhaps be as well to notice here parenthetically that these four direct contributions provide indirectly the means for local expenditure. To the principal of these are added *centimes additionnels*, or an additional percentage, the greatest part of which is handed over to the local authorities, departmental or municipal. The former may be considered as having no other revenue. The municipalities' share amounts to 214 millions (£8,560,000); and in towns, the OCTROI (*q.v.*) or municipal duties on consumption yielded in 1904 about 271 million francs (£10,840,000).

The legislature at the time of the outbreak of the great revolution was eager to follow the teachings of the PHYSIOCRATS and to repeal indirect taxation. But necessity compelled the reversal of their plan, and direct taxation now scarcely provides one-sixth of the receipts, whilst indirect taxation, under which head are included stamp and registration duties, provides about two-thirds.

The revenue derived from indirect taxation may be summarised thus:

	francs	£
1. Registration duties	594 mill.	say £23,760,000

The principal branches of these duties yield—

	francs	£
Registration on transfer of real property	133 mill.	5,320,000
Death duties	243 ,,	9,720,000
Duties on donations (mostly marriage settlements)	22 ,,	880,000
Transfer of personal property	72 ,,	2,880,000
Fixed duties on judicial acts	23 ,,	920,000
Mortgages ,, ,, ,,	11 ,,	440,000
2. Stamps (on commercial bills and cheques 41 mill. of francs (£1,640,000))	186 ,,	say 7,440,000
3. Tax of 4 per cent on the dividends of joint-stock shares and bonds	84 ,,	say 3,360,000

[The interest on the French national debt, mortgages, private loans, and commercial profits of private partnerships remain free.]

	francs	£
4. Customs (Of this 386 mill. (£15,440,000) on imports)	436 mill.	17,440,000
5. Sugar	150 ,,	6,000,000
Other "Contributions indirectes," or excise	608 ,,	24,320,000
Alcohol	358 mill.	14,320,000
Wine and cider	65 ,,	2,600,000
Beer	14 ,,	560,000

State duties on the so-called hygienic drinks —wine, cider, and beer—have been reduced. Salt pays to the customs and excise together 34 millions of francs (£1,360,000). The *Contributions Indirectes* also comprise the duties on transport and communications by rail, the latter 67 millions of francs (£2,680,000).

In the next division of the budget of receipts appear the gross proceeds of state monopolies and state manufactures for a total amount of 842 millions of francs (£33,680,000), subdivided in the following way:—

	francs	francs	£
Matches	35 mill.	498 mill.	19,920,000
Tobacco	446 ,,		
Gunpowder	17 ,,		
Post Office	246 ,,	326 ,,	1,304,000
Telegraphs	45 ,,		
Telephones	35 ,,		
Net revenue of railway lines belonging to the state	14 ,,		560,000

The working expenses or cost of production come in under sundry headings in the *Budget des Dépenses* (expenditure). The net revenue of the post and telegraphs is generally taken at about 50 millions of francs (£2,000,000); and tobacco is calculated to yield net more than 300 millions (£12,000,000).

Of the 61 millions of francs (£2,440,000) derived from the state property, more than one-half is derived from forests owned by the state. The present property of the state plays thus a very secondary part in French finance, but towards the middle of the 20th century it will vastly increase, as between 1950 and 1960 the *concessions* of most of the railway companies will expire, and their lines and buildings become the property of the state. About 50,000 kilometres (30,000 miles) are worked at the present time, and yield a revenue of 687 millions of francs (£27,480,000).

EXPENDITURE.—The following table gives the amount of the *crédits* or supplies granted to the different ministries :—

	francs	£
Ministry of finance . . . (1226 millions, or £49,040,000, for interest of the national debt)	1510 mill.	60,400,000
Ministry of justice . . .	37 ,,	1,480,000
Ministry of foreign affairs . .	17 ,,	680,000
Ministry of the interior . .	88 ,,	3,520,000
Ministry of the navy . .	325 ,,	13,000,000
Ministry of war	719 ,,	28,760,000
Ministry of the colonies . .	110 ,,	4,400,000
Ministry of public instruction, fine arts, and religious worship . . . . . (Instruction 250 mill., arts 14, religious worship 43)	307 ,,	12,280,000
Ministry of commerce, industry, post and telegraphs . . .	313 ,,	12,520,000
Ministry of agriculture . .	45 ,,	1,800,000
Ministry of public works .	230 ,,	9,200,000
Total expenditure	3701 ,,	£148,040,000

Owing to the voted separation of church and state, the religious expenses will in future budgets be reduced to temporary pensions and repairs to historical monuments.

The budget of Algeria is, since 1900, detached from the budget of France proper.

In appearance the budget of 1906 is thus brought into a state of strict equilibrium ; but even assuming that the actual receipts will reach the amount of estimates, and although the principle of the *universality* of the budget of expenditure, namely, that it ought to comprise the whole of the foreseen expenses, has been constantly acknowledged in theory, it is in fact often disregarded, neither is sufficient account taken of future expenditure entailed by previous legislation. The creation of *extraordinary budgets* and funds (*caisses*), supposed to deal with temporary and special expenditure, has been the expedient resorted to. The creation of the *Compte de Liquidation* immediately after the disastrous war of 1870, when France had to pay an enormous war indemnity and to reconstruct the whole of its military establishment, was no doubt perfectly justified. But, principally after 1882, the institution of such funds has had for its object the concealment of real deficiencies, over 28 millions sterling in 1883, incurred on account of public works undertaken on a gigantic scale, and rather premature reductions of taxation. However, since that time there has been a steady and laudable tendency towards financial honesty ; and the subsidies to railway companies, under the form of guarantee of a minimum rate of interest on capital invested, are now included in the general budget.

It cannot be said that any definite method has been adopted towards assessing taxation so as to divide its burden between property and income. Only about 40 millions of francs (£1,600,000) are levied directly on what may be called luxuries, but affluence is indirectly, though effectively, reached through the duty on house-rent.

No such thing exists as a general income-tax on the English model ; professional incomes contribute through the operation of the *patentes*, (trade licences), and the income derived from securities other than the national debt or mortgage, through the tax of 4 per cent on the dividends of *valeurs mobilières* (transferable securities), but other incomes generally escape taxation. After the events of 1870-71, 750 millions of francs, 30 million sterling, of new taxes were suddenly wanted, and the aim of the government was to find out the line of least resistance, a circumstance which explains, and more or less excuses, the absence of methodical foresight. Whenever the necessity of levying an increased amount of taxation occurs, the want is felt of a form of tax, such as the English income-tax, which can be easily adjusted to the exigencies of the moment. New taxes are devised almost at hap-hazard, sometimes according to the crotchets of influential members of the lower house, who unhappily too often and too freely indulge their initiative power in financial matters. In France, customs-duties, it is well known, are as much a protectionist as a fiscal machinery.

After the Franco-German war, a large annual provision (200 millions of francs or 8 million sterling) was carefully made for the paying off of the national debt ; but for several years scarcely any other reduction has been made except the paying off of annual quotas of the terminable debt, *rente amortissable*, instituted in 1878 when the extensive scheme of public works known as the *plan Freycinet* was launched. This terminable debt scarcely represents one-eighth of the national liabilities. Some, however, contend that at the expiration of the *concessions* of the railway companies already mentioned, the net proceeds of these lines will cover the interest on consolidated debt, but this appears exaggerated.

No special quota of the general revenue is reserved for local expenditure, although the state largely contributes to several of its branches.

To conclude, a summary view of the state of French finance is here given:

	francs	£
Budget (1906)	3,704 mill.	148,160,000
Public debt	32,000 ,,	1,128,000,000
General taxation	2,900 ,,	116,000,000
Local taxation	800 ,,	32,000,000

In 1869, the last normal year before the war, the parallel figures were:

	francs	£
Budget of expenditure	2,014 mill.	80,560,000
Public debt	12,000 ,,	480,000,000

[A clear and handy summary of the budget of 1893 is given in M. Bidoire's *Tableau résumé du Budget de 1893* (Paris, 1892). For general works see the *Dictionnaire des Finances* (Paris, 1888) published under the direction of M. Léon Say.—The *Nouveau Dictionnaire d'Économie Politique* (1892).—Paul Leroy Beaulieu, *Traité de la Science des Finances* (7th edition, 1905).—René Stourm, *Le Budget.*—Bidoire et Simonin, *Les Budgets Français, étude analytique et pratique*, 3 vols., Paris (1895-1897).—A. Stourm, *Bibliographie historique des Finances de la France au 18me siècle*, 1895.] E. Ca.

GERMAN EMPIRE and PRUSSIA (Amounts in marks converted as 20 = £1). In Germany the functions of government are partly performed by the confederation of all the individual states, the German empire, and partly belong to these individual states themselves. These are (Elsass-Lothringen included), twenty-six in number and extremely different in size, ranging between 30,000,000 and only 39,000 inhabitants. Besides, there exists in Germany as elsewhere the local finance connected with the cities and country districts which defray their expenses independently.

I. THE FINANCES OF THE EMPIRE.—The chief expenditure is that for the army and navy, the organisation of which belongs to the confederation, not to the particular states. The Bavarian army only has in time of peace its separate financial administration; but the money spent by the Bavarian government on its army is paid to it in a lump from the exchequer of the empire. Among other expenses are those of the foreign office, including diplomatic service, the high court of judicature, to which under certain conditions appeals lie from the courts of the individual states both in civil and criminal cases, and the imperial home department. Among the expenses of the latter department are those for the economic interests of the country, such as the subvention of mercantile shipping, and workmen's insurance, etc. The fiscal year runs, as in England, from 1st April to 31st March. The amount of the expenditure is voted yearly by the federal council and the parliament. Among the expenditure a distinction is made between recurring and exceptional items. Among the last named, a further distinction has been made for some years between "exceptional expenditure of the ordinary budget," and "exceptional expenditure of the extraordinary budget." The expenditure of the former description is that which, like the recurring expenditure, is defrayed out of the ordinary revenue, while, on the other hand, the "exceptional expenditure of the extraordinary budget" is raised by loans or from special funds. In reality the whole difference between recurring and exceptional expenditure is very slight, because though the special occasion calling for any particular exceptional expenditure does not recur in every year, the total amount even of this class of expenditure does not vary much from year to year.

The consolidated debt of the empire is £94,000,000.

For the fiscal year 1894-1895 the following expenses of the Empire have been voted:—

(The statement does not include the expenditure for the postal service—which is deducted from the revenue under the same head—see p. 73—nor the part of the expenditure for pensions derived from the income of the Invalid Fund.)

Expenses, Empire of Germany.

Item of Expenditure.	Recurring.	Exceptional.		Total.
		Ordinary Budget.	Extra-ordinary Budget.	
	£	£	£	£
Chancellor's office and Imperial Diet and Foreign office . .	544,000	238,000	..	782,000
Home Department .	1,360,000	215,000	1,036,000	2,611,000
Army	24,001,000	1,917,000	4,636,000	30,554,000
Navy	2,535,000	950,000	212,000	3,697,000
Administration of Justice . . .	103,000	50,000	..	153,000
Finance Department .	254,000	8,000	..	262,000
Railway Department .	17,000	..	630,000	647,000
Imperial Debt Service .	3,587,000	..	..	3,587,000
Audit Department	32 000	..	..	32,000
Pensions, etc. (chiefly Military, but not including pensions derived from Income of Invalid Fund) . .	2,428,000	..	..	2,428,000
	£34,861,000	£3,378,000	£6,514,000	£44,753,000

The means adopted by the empire to raise this amount are the following:—

1. *Revenue arising from the property of the state.*

(*a*) The empire reserved out of the French war indemnity several large sums which produce interest. If necessary, besides the interest, the principal itself is gradually applied to certain objects which have to be carried out by the state. The largest of these reserved capitals is the "Invalidenfond." At its foundation it was appropriated only to the payment of pensions to the invalids and the widows of the soldiers who fell in the French war. Afterwards some further payments for military pensions were assigned to it. The amount of the fund originally was £28,050,000; up to 30th June 1891 (the date of the last report published), £4,900,000 of this capital, had been spent besides the interest; the amount remaining was therefore £23,150,000.

(*b*) The empire is the proprietor of the railways in Alsace-Lorraine (Elsass-Lothringen); their original purchase-money, together with the sum afterwards spent on them, was upwards of £25,000,000. The net revenue arising to the exchequer is estimated for 1893-94 at £1,037,500, and nearly as high for 1894-95.

(*c*) The empire takes the revenue arising from the post and telegraphs outside of Bavaria and Wurtemberg, which for 1894-95 is estimated at £989,000.

(*d*) The empire owns a printing-office which works both for the public and for private customers; the net revenue is estimated at £58,600, and for 1894-95, £68,300.

2. *Customs.* The whole territory of Germany is included in one customs-frontier with the exception of some inconsiderable parts of Baden, Prussia, and Hamburg; on the other hand Luxemburg, though not belonging to the confederation, is also within this same frontier. But the customs revenue does not entirely fall to the empire. Since 1878, according to the Frankenstein-clause (so called after the name of the deputy who moved it in the Reichstag), the empire only takes yearly from the customs revenue, together with the duty on home-grown tobacco, £6,500,000, the whole surplus being distributed among the individual states. The total customs revenue for 1893-94 is estimated at £17,056,100, and for 1894-95 at £17,485,000.

3. *Excise.*

(*a*) The salt duty, being 6 marks on every cwt. of salt produced in the empire and destined for human consumption within the country, brings about £2,137,000 for 1894-95. The duty on foreign salt imported is naturally included in the customs revenue, and is between £100,000 and £150,000; hence the salt duty in Germany amounts to about 11d. per head of the population.

(*b*) The sugar duty is 18s. for every two cwts. of sugar produced and consumed within the country, the sugar reserved for export remaining duty free, and even receiving a bounty. This latter is now—for raw sugar 1s. 3d. for every two cwts., for candy 2s., for other refined sorts 1s. 8d. These bounties and the drawbacks on confectionery exported amount to £525,000. The estimated net revenue to the empire for 1894-95 after deduction of this sum is £3,770,000.

(*c*) Tobacco, if grown within the empire, is taxed at £2 : 5s. for every two cwts. of dried produce; the amount of the tax is estimated for 1894-95 at £554,000. But the exchequer of the empire does not receive this sum, because the internal tax on tobacco, as far as, together with the surplus of the customs duties, it is above £6,500,000 yearly, is distributed among the individual states. The revenue from imported tobacco, which is much larger than that derived from home-grown tobacco, is included in the customs revenues. It was in 1891-92 more than £2,150,000. Great alterations in the tobacco duty were contemplated (November 1893); and the tax on the raw produce of the country was to be abolished, the customs duty reduced, and the product ready for consumption taxed at the manufacturer's, but this scheme has been dropped for the present.

(*d*) The beer duty is raised as a federal duty in the northern part of the empire only; whilst in Bavaria, Wurtemberg, Baden, and Elsass-Lothringen the beer taxes are a revenue of the individual state, levied according to its separate legislation. The federal duty is laid on the malt, or the substitutes for malt, when brought

to the brewery; it is 4s. for two cwts. on all descriptions of grain, and for substitutes in proportion. The beer coming from the southern states to those in which the empire receives the tax on production has to pay an import-duty to the empire. The beer duty and this internal import-duty are estimated, in the revenue of the empire for 1894-95, at £1,243,000.

(*e*) The duty on spirits has been levied since 1st October 1887, throughout the whole empire. It consists of two parts—of a tax on the production of spirits, and of a tax on consumption. For the purposes of the tax on production three classes of distilleries are distinguished: 1st, such as employ grain as material, and are at the same time part of agricultural undertakings (called agricultural distilleries); 2nd, such as employ sugar or sacchariferous materials; 3rd, such as employ grain but are not altogether part of agricultural undertakings (called industrial distilleries). The tax on the production of the first class of works is levied on the space which the mash fills in the fermenting vats; it is 1s. 4d. for every hectoliter of the contents of the tub. In the second class, if sugar or similar substances—*e.g.* fruits—form the materials, the substances employed are to be taxed according to their weight and kind. The industrial distilleries, finally, pay an addition of £1 per hectoliter on the tax on consumption. The smaller establishments among all the classes are allowed some reduction on the normal rate of the duties. The amount of the duty on consumption is fixed in the following manner. For a quantity of 4½ liter per head of the population in northern Germany, and of 3 liter per head of the population in the south, the tax on consumption is 6d. the liter; for any excess in the consumption of the country the duty is 8½d. the liter. The total quantity allowed to be produced at the lower rate is allotted to the individual distilleries according to their size.

Of these different duties on spirits only the tax on production remains to the empire. The tax on consumption and the tax on the ready-made produce in the industrial distilleries are distributed to the individual states according to the number of their inhabitants. For 1894-95 the taxes on spirits remaining to the empire were estimated at £899,000, those to be distributed among the states at £5,005,000.

4. *Stamp duties.*

(*a*) A tax on bills of exchange of 6d. for every £50 drawn; but amounts below £50 are taxed somewhat lower. The revenue is estimated for 1894-95 at £379,000.

(*b*) A tax on playing-cards, estimated for 1894-95 at £62,800.

(*c*) Taxes on—1st, the issue of stock exchange securities; 2nd, on every sale of such securities. The former duty is estimated for 1894-95 at £221,000, the latter at £552,000. These sums are to be distributed among the individual states. An act passed in 1894 imposes a higher *ad valorem* scale.

(*d*) A tax on public and private lotteries, producing in 1894-95 £452,000. This tax also does not accrue to the empire, but is divided among the states according to their population.

(*e*) A statistical duty on the goods exported and imported, levied with the receipt of the declarations relating to the quantities, the origin, and destination of the goods. It produces for 1894-95 £34,000.

5. Share of profits from the imperial bank, and tax from other banks of issue, amounting, according to the estimate for 1894-95, to £362,000.

6. *Contributions by the Individual States.* There can never be a deficit in the imperial budget because any excess of expenditure over the imperial taxes is covered by these contributions which are called matricular contributions, and are distributed among the states in proportion to their respective populations, additional contributions being imposed on those states which have a separate postal administration, and also on those in which no federal beer duty is levied. The total amount of these contributions, as fixed for 1894-1895, is £19,875,000, but this sum is of course subject to a deduction of £17,772,000, being the amount of the above-mentioned duties and taxes collected by or on behalf of the empire for the benefit of the individual states. The matricular contributions form an element of uncertainty in the state budgets, and a bill has in consequence been brought forward by the imperial government providing that the amount of matricular contributions shall in future be at least £2,000,000 below the amount of taxes and duties collected for the individual states, and that any deficiency thus caused must be covered by imperial taxation. It is very doubtful whether this proposal will be carried through.

For the fiscal year 1894-1895 the following revenue of the empire has been voted:—

Revenue—Empire of Germany.

Item of Revenue.		Amount.
Balance from last year		£69,000
Revenue from State property (not including revenue from Invalid Fund, and deducting extraordinary expenses incurred in respect of Postal Department)		2,207,000
Customs		17,485,000
Excise		13,612,000
Stamps		1,702,000
Revenue from Imperial Bank, etc.		362,000
Sale of land		70,000
Miscellaneous Revenue		629,000
Matricular Contributions	£19,875,000	
Less amounts payable to individual States	17,772,000	2,103,000
		38,239,000
Revenue raised by loans and from special funds		6,514,000
		£44,753,000

II. The expenditure of the individual states for their own purposes is about equal to the expenditure of the empire for federal purposes. Thus the Prussian expenditure for 1894-1895—as shown below (after deduction of the amount required for the service of the public debt which must be set off against the revenue from state property) amounted to about £22,000,000 (=50 per cent of the expenditure of the empire), the Prussian population representing about 60 per cent of the whole population of Germany, and similarly Bavaria (having a population of about 11 per cent, of the whole German population) spends a yearly sum amounting (after deduction of the interest on the railway debt, which is about equal to the income from the railways) to £5,100,000 (=11½ per cent of the imperial expenditure).

Prussian Expenditure, 1894-95.

Civil List Recurring Expenditure	£786,000
Houses of Parliament	69,000
Chief Government Department and Audit Department	130,000
Foreign Affairs	26,000
Financial Administration, Inland Revenue Department, and Provincial Government	3,509,000
Public Works, etc.	1,034,000
Trade Department (including subventions to technical education and technical industry)	231,000
Administration of Justice (after deduction of Court fees)	1,550,000
Home Department (including Local Government Expenditure, Prisons, and Police)	2,099,000
Agricultural Department	669,000
Education: (Elementary and Higher as well as University) and Public Worship	5,138,000
Pensions and Miscellaneous	3,841,000
Service of Public Debt	14,101,000
Exceptional Expenditure	2,893,000
	36,076,000
Contribution to Empire	12,399,000
	£48,475,000

Prussian Revenue, 1894-95.

Government Lands and Forests		£2,636,000
,, Mines and Smelting Works		814,000
,, Railways		18,372,000
,, Lottery		488,000
,, Bank (Seehandlung)		94,000
Taxes—		
Direct	£8,827,000	22,404,000
Indirect	1,982,000	
		10,809,000
Miscellaneous Revenue (including Return of Taxes collected by Empire)		11,752,000
To be raised by the issue of a Loan		3,510,000
		£48,475,000

The indirect taxes in the German states which do not levy a state duty on beer are of no great importance. A wine duty exists in some of the southern states, and in Saxony and Baden a duty on meat. As to the direct taxes they are of two kinds: taxes on property or income levied at the source (objective taxes), and personal income-tax. In the southern states, especially in Bavaria and Wurtemberg, objective taxation prevails, whilst in the northern states, as Prussia, Saxony, the personal income tax is of greater importance. Baden and Hesse are between these extremes.

A complete system of objective taxes comprises: (1) a land tax; (2) a house tax; (3) a tax on trades; (4) a tax on income from stocks and shares; (5) a tax on wages and salaries. All these five taxes are to be found in Bavaria and Wurtemberg; the tax on wages and salaries is not levied in Baden and Hesse; while Saxony has only a so-called land tax; Prussia has the three first named objective taxes, but they have been repealed as from the 1st April 1895. In Bavaria, of the direct taxes for 1892 or 1893, the land tax is estimated as £575,000, the house tax £262,500, the tax on trades £325,000, the tax on loans £208,330, that on wages and salaries £100,000. In Prussia up to this date the land tax produces about £2,000,000, the house tax £1,825,000, the tax on trades £1,125,000.

The income-tax in Prussia has lately been rearranged by the law of 24th June 1891. Incomes under £45 are free. The rate on small incomes is below 1 per cent; for incomes of £150, 2 per cent; for incomes of £400, about 3 per cent; and incomes of £5000 and above pay 4 per cent. The produce of the tax is about £6,250,000. In Saxony £15 is the limit of exemption and the rate does not rise higher than 3 per cent. The produce of the tax for 1893 is estimated at £962,500. In Baden the income-tax has been during recent years 2 per cent on the estimated income. But an abatement is allowed for smaller incomes, only those of £1500 and upwards paying the full tax. The produce of the tax thus assessed was about £200,000. In 1894 the percentage to be levied from the higher incomes has been increased.

A new personal tax, viz. a tax of $\frac{1}{20}$th per cent of the capital value of each taxpayer's real and personal property has been introduced in Prussia as from the 1st April 1895; its produce is estimated at £1,750,000. Persons of small means are exempt, and real property situate outside of Prussia is not included in the assessment.

III. Of great importance also is the local finance. In Prussia the parish rates in 1884 were £8,600,000, and the district rates £1,150,000. Among the expenses of the parishes the most considerable are those for the poor, for the roads and for education. In Prussia, 1883-84, out of a total of £18,550,000 the expenditure on roads was £2,500,000 (13 per cent), for the poor £2,450,000 (13 per cent), for education £4,250,000 (23 per cent). Part of these expenses is covered by revenue from property and by profitable undertakings, as gas and water works. In Baden the net value of the property of the parishes was estimated, 1st January 1887,

at £15,500,000. In Prussia in the rural districts the parishes cover 20 per cent of their expenses in this way, in the towns 11·6 per cent. The taxation is chiefly a direct one, consisting of an addition to the taxes assessed and levied by the state for its purposes. In the towns of the southern states indirect taxes of some importance exist, such as additions to the state taxes on consumption—the wine, beer, meat duties—and an octroi duty on various necessaries and conveniences brought to the town—coal, flour, meat, fish, etc. In Bavaria, 1878, the direct local taxes were £850,000, the indirect taxes in the twelve largest towns £250,000. In Baden, 1888, the direct taxes of the communes not considered as towns were £466,666, those of the towns nearly £175,000, together £637,500, the indirect taxes in the towns only £450,000 to £500,000. In Prussia the towns raised in 1883-84 local taxes per head of the population 12s. 4d., the rural districts 5s. 10d.; in Baden the towns, 16s. 9d., the rural districts, 7s. In Baden in 1889 the direct local taxes add on average 50 per cent to the corresponding state taxes.

The above states the position of matters in 1895. In 1904-5 the estimated revenue of the empire was £101,624,000, while the expenditure was £100,093,000. The customs revenue was £25,543,000 and the excise duties £16,637,000, while the expenditure on behalf of the army and navy was £32,335,000 and £11,428,000 respectively. The public debt was £146,812,000.

THE NETHERLANDS. (Amounts converted at 12 guilders = £1.) The finances of the Netherlands are in a sound condition. Whilst fifty-five years ago, in 1850, with a population of barely 3,000,000 and a budget of about £6,000,000 sterling, the capital of the national debt amounted to over £100,000,000 sterling with an annual interest-charge of £3,000,000; nowadays, with a population of about 5,500,000 and a budget of more than double the amount of 1850, the capital of the national debt is only £95,400,000 with about £2,660,000 annual interest-charge. The exact figures of the national debt are—

	Nominal Capital.	Annual Interest.
1850	£102,637,700	£3,020,155
1905	£95,413,435	£2,667,450

From 1850 until 1905 inclusive, a total amount of £27,416,651 has been expended on amortisation of debt. In some years, however, the debt has increased again, namely, up to 1892, by a total amount of £16,145,600. But against this increase of debt stands expenditure on remunerative public works for an amount vastly superior. Up to 1902 the total expenditure on the railroads alone amounted to £29,805,000.

Again, whilst formerly the East India colony, namely Java, contributed a rather important amount to the revenue of the Netherlands, since 1877 this contribution has ceased entirely. From 1850-1877 these contributions amounted in all to £48,975,600. It was, in fact, these contributions which, from 1850 until the middle of 1870, enabled the government to amortise the debt for such an important amount (it may be useful to add that for a large amount the debt had been contracted previously in behalf of the colonies also) devoting at the same time very large sums to public works.

At first, when these colonial contributions to the revenue of the Netherlands had to be given up this caused some embarrassment, the more so as about the same time there was a considerable increase in the expenditure principally for public schools. The consequence was that for some years after 1880 the expenditure was not entirely covered by the revenue. But within a few years, by raising new taxes and other measures, the situation was modified and there was an end to the deficits. The cessation of the colonial contribution arose partly from the increase of expenditure in Java to which the war with Atchin contributed, but most of all from a change in the colonial policy of the government, the colonies being nowadays governed only for their own benefit, no tribute whatever being exacted from them on behalf of the Netherlands; more than this, the expenditure made by the Netherlands indirectly on behalf of the colonies (part of the home-charges) is not even repaid from the revenue of the colonies.

The fiscal system, however, had for many years been in serious want of some reform. This was not undertaken until quite recently, namely under the late government—finance-minister M. Pierson—which came into power

in 1891, but the government having again been turned out of power early in 1894, this reform was interrupted. Unfortunately the financial result of the property tax, levied since May 1893, has been somewhat disappointing. It was expected to bring in £716,666, but the proceeds were not higher than £566,666 the first year.

The revenue for 1894 was derived from the following sources :—

Direct taxes	Land tax	£981,450
	Personal tax	967,583
	Droit de patente (till 1st May 1894)	121,333
	Tax on incomes not arising from property (after 1st May 1894)	255,583
	Property tax	566,666
Indirect taxes	Excise	3,495,833
	Registration duties	370,833
	Succession duties	966,000
	Stamps, etc.	302,916
	Import duties	480,104
Domains		194,583
Post and telegraphs		744,416
Railways		329,166
Other items		912,176
	Total	£10,688,642

The land tax is levied on the ratable yearly value of land and houses ; the state levies 6 per cent on the net rateable rent from land not built upon, and 5·2 per cent on the gross rateable rent from houses.

The personal tax, a tax on expenditure, is calculated principally on the letting value of the dwelling occupied, the value of the furniture, and the number of servants. There is a universal agreement that this tax needs revision.

Real property, besides being subject to the land tax, is also subject to the property tax. The object of this tax is to levy a percentage on the income from property, but the percentage is computed not on the income itself, but on the capital value of the property. The tax is slightly progressive. For every 1000 guilders (£83 : 6 : 8) above 10,000 (£833 : 6 : 8) the tax is 1·25 guilders, but if the property amounts to more than 200,000 guilders, (£16,666 : 13 : 4) 2 guilders per 1000 are paid on the surplus.

On 1st May 1894 the *droit de patente*, or tax on occupations, was replaced by a tax on business profits, and on all incomes from labour, assessed in such a manner that, in connection with the property tax, it will have the effect of a general income tax. This tax also is slightly progressive ; for the incomes below 8200 guilders per annum, it is 2 per cent, for higher amounts 3·20 per cent on the surplus is added. The property tax being levied at the rate of 1½ and 2 per mille on the capital, the tax on business profits is 36 per cent less than the tax on incomes derived from property only —on the hypothesis adopted by the government that the income from property averages 4 per cent. Property up to 13,000 guilders (£1083 : 6 : 8) is free from property tax, and income up to 650 guilders (£54 : 3 : 4) from the tax on profits and wages.

The succession duties are not progressive ; they differ according to the degree of relationship between the deceased and his successors. From parents to children the duty is 1·38 per cent ; husband and wife pay the same amount, if they inherit one from the other, when there are descendants from their union ; if parents inherit from their children, the duty is 4·14 per cent ; between brothers and sisters, or between husband and wife, if there are no descendants, it is 5·52 per cent ; between uncle and niece, or inversely, 8·28 per cent ; and between all others 13·8 per cent. In so far as the property inherited consists of stock, bonds, stock-exchange securities and other interest-bearing securities, there is levied, besides the succession duties referred to, a special succession duty, varying from 0·345 to 2·76 per cent. The total amount of the succession duties rises in this way from 1·725 per cent in the first degree of relationship, to 16·56 per cent from distant relatives or strangers.

The excise on spirits is high, £5 : 5s. on every hectoliter (22 gallons) ; from spirits alone a revenue of £2,166,000 annually is raised. The fiscal law concerning the sugar duties until 1903 gave a bounty to the producers.

The Netherlands are a free-trade country, food and raw produce enter without duty, manufactured goods generally pay 5 per cent of the declared value. Measures were taken in 1895 for securing that the proper percentage is really paid.

The state-railroads are leased to private companies ; the rents they pay form the greater portion of the receipts under this head. The miscellaneous receipts include various payments to the treasury which are distributed over the several departments : repayments, reimbursements, legal fees, etc. ; and also (*a*) £62,500 payment by the Netherlands Bank for the right of issue of banknotes, which payment depends from the amount of the bank's profits of the year ; (*b*) £154,500 reimbursement by the colonial treasury for interest on debt—£3,806,250—contracted in 1883 by the home government on behalf of the East Indian colonies.

The expenditure for 1894 is divided as in the following table :—

Civil list	£67,000
Parliament	55,625
Foreign affairs	65,410
Justice	452,681
Home Office	1,069,717
Carry forward	£1,710,433

Brought forward .	£1,710,433
Marine	1,301,761
National debt	2,910,719
Finances	1,595,904
War	1,856,560
"Waterstaat," commerce and industry	1,837,337
Colonies	113,434
Unforeseen	4,166
Total .	£11,330,314

The item finances includes: (*a*) £714,288 payment by the government treasury to the municipal governments on account of the personal tax in virtue of an arrangement that was made in 1865 when the municipal excise-taxes were abolished; (*b*) £164,280 payments to the clergy of the Reformed, Roman Catholic, and Jewish churches by the state; (*c*) £125,671 pensions; and further, the expenditure of collecting revenue and the general expenditure of the department of the treasury and also of administration of debt.

The item Waterstaat includes the expenditure for post and telegraphs, amounting to £710,000; and the expenditure on embankments and other defence against the sea's encroachments, on canals and rivers, and also almost annually a certain amount of expenditure for remunerative public works.

It will be observed that the total of the expenditure for 1894 is

	£11,330,314
Against total revenue	10,688,642
Leaving a deficit of	£641,672

But the expenditure includes this year disbursements for remunerative public works for a total amount of £221,750, and besides it is calculated that the credits opened in the budget for general expenditure exceed regularly the real expenditure for an amount of, at least, £250,000. Deducting these two items, the deficit is reduced to about £180,000. This deficit is the consequence of the proceeds of the property tax not having been as high as it was expected they would be. Towards meeting this the then finance-minister proposed to modify the mode of levying the import-duties, which are said to be at least £150,000 short through frauds.

THE BUDGET FOR 1906.—*Revenue.*—Land tax, £1,147,000; personal tax, £829,166; property tax, £707,916; tax on other incomes, £636,666; excise, £4,506,666; import duties, £950,000; other indirect taxes, £2,011,791; post and telegraphs, £1,385,750; railways, £349,011; other items, £1,762,058—total, £14,286,024.

Expenditure.—Civil list, £82,500; parliament, £58,266; foreign affairs, £84,113; justice, £602,847; home office, £2,093,950; marine, £1,438,927; national debt, £3,058,284; finances, £1,944,112; war, £2,276,023; "waterstaat," £2,887,504; agriculture, industry, and commerce, £322,887; colonies, £289,269; unforeseen, £4166 — total, £15,142,851. Deducting £559,871 extraordinary expenditure, a deficit of £296,956 remains.

THE UNITED STATES. NATIONAL FINANCE. (The $ converted as 5 = £1 in this statement.)

I. REVENUE—(*a*) *Import Duties.*—The main source of national revenue has always been from the customs. The first tariff of import duties was enacted immediately after the formation of the government under the present constitution in 1789. At first chiefly a revenue measure, with increasing rates to yield larger revenues, the tariff gradually became a system of avowed protection to American industry. The rates varied with the successive domination of political parties, but the yield increased steadily from decade to decade. At the outbreak of the civil war the rates were largely augmented, the largest revenue under the war rates being $216,000,000 (*£43,200,000*) in 1872. The crisis of 1873 reduced the revenue to $130,000,000 (*£26,000,000*) in 1877, and it was not until 1882 that the preceding greatest yield was reached and even slightly exceeded. Since the civil war there have been several changes, generally in the direction of higher protective duties, which diminished the revenue for several years at a time. The tariff of 1883 reduced the revenue from $220,000,000 (*£44,000,000*) in 1882 to $181,000,000 (*£36,200,000*) in 1885; the tariff of 1890 reduced the revenue from $230,000,000 (*£46,000,000*) in 1890 to $177,000,000 (*£35,400,000*) in 1892.

The highly protective M'Kinley Tariff (1890) increased duties on raw materials and articles manufactured in the United States, particularly on raw wool, goods manufactured of cotton, linen, and silk, on iron and steel manufactures, on barley, hemp, and flax. This act also instituted a bounty on sugar, the raw sugar duties having been repealed, and introduced the principle of commercial reciprocity, empowering the President to levy duties on certain raw materials imported from any country raising unfair duties against the United States. The Wilson Tariff (1894), intended to recast the protective system, only remained in force three years, being regarded by the Republican party on their return to power as causing the large annual deficit in the Treasury. The Dingley Tariff (1897), while the needs of the Treasury

were kept in view, was entirely protective. It revived the principle of reciprocity of 1890, together with many of the duties then imposed such as that on wool, while those on linen, cotton, woollen and silk manufactures, on certain iron and steel goods, and machinery, were increased. The duties on raw iron and steel remained unchanged. The duty on sugar was increased for revenue and for protective purposes. Bacon, cheese, butter, wheat, and rice are also taxed. The customs receipts for 1904 were $261,274,564 (*£52,254,913*), being $23,000,000 (£4,600,000) less than in 1903. This, though largely due to high returns in 1903, was partly accounted for by the abolition of the War Tax on tea, of the countervailing duty on sugar, and by the reciprocity treaty with Cuba, causing a loss to the revenue on sugar and tobacco.

(*b*) *Internal Revenue.*—Internal Revenue taxes were tried in the last decade of the 18th century, and again during the war with England of 1812. The present system is an outgrowth of the civil war. Most of the taxes then adopted were repealed before 1872, and many of the others reduced or repealed in 1883 and 1890; but to meet the expense of the Spanish War of 1898 new duties were levied, those on tobacco and fermented liquors, except spirits, being doubled. Stamp taxes were laid on cheques, drafts, and many business operations, on patent medicines, etc.; an excise duty was levied on refiners of sugar or petroleum; a legacy duty imposed; banks and brokers, and places of amusement taxed. The tax on national banks is not technically included in the internal revenue. There is also a tax on oleomargarine, and a prohibitory tax on opium manufactured in the United States. Recently large sums have been paid by the treasury for redemption of stamps and refunding of taxes.

The maximum yield of the internal revenue in 1866, when it included an immense complex of all imaginable taxes, was $309,000,000 (*£61,800,000*). Reductions in 1872 and earlier decreased the revenue in 1874 to $102,000,000 (*£20,400,000*). The reductions of 1883 diminished the revenue from $146,000,000 (*£29,200,000*) in 1882 to $112,000,000 (*£22,400,000*) in 1886; notwithstanding the reductions of 1890 the revenue increased from $140,000,000 (*£28,000,000*) in 1890 to $154,000,000 (*£30,800,000*) in 1892. The additions in 1898 caused a rise from $171,000,000 (*£34,200,000*) in 1898 to $273,000,000 (*£54,600,000*) in 1899, and $307,000,000 (*£61,400,000*) in 1901.

The income from internal revenue during 1904 was $233,000,000 (*£46,600,000*), divided as follows:—

Distilled spirits .	$135,810,015	£27,162,003
Fermented liquors .	49,083,458	9,816,691
Tobacco . . .	44,655,808	8,931,161
Oleomargarine .	$484,097	£96,819
Miscellaneous .	2,870,623	574,124

The cost of collection was 1·94 per cent.

(*c*) *Other Sources of Revenue.*—The customs and internal revenue form the great bulk of the entire receipts of the national government, amounting in 1904 to $494,178,684 (*£98,835,737*) out of $684,214,373 (*£136,842,875*). The proportion is even larger than it appears, because the postal service, which is almost self sustaining, is counted on both sides of the balance sheet, the receipts and expenditures for the post office being $143,582,624 (*£28,716,525*). The policy of the national government is to reduce postal rates rather than to make profits. In 1904 the deficiency in postal revenues was $6,502,530 (*£1,300,506*). Moreover, the budget of the district of Columbia, in which the city of Washington lies, is included in the federal budget. The receipts from this alone in 1904 amounted to almost $5,454,344 (*£1,090,869*).

The remaining $40,998,722 (*£8,199,744*) of revenue were derived from sales of public lands, fees, profits of coinage, sinking fund for Pacific railways, tax on national banks, and a number of minor miscellaneous sources. The profits on coinage were very much swollen between 1878 and 1891, owing to the difference between the market price and the mint price of the silver dollars issued under the Bland bill, amounting in some years to 25 or 30 per cent of the entire amount coined. Under the Bland bill 378,166,793 silver dollars were coined between 1878 and 1891, on which the seignorage, or profit, to the government was $71,952,392 (*£14,390,478*). This profit is now unimportant. During the sixties the government loaned the Central and Union Pacific Railway Companies about $64,000,000 (*£12,800,000*). The law of 1878 provided for a sinking fund and gradual repayment of the debt. During 1904 the revenues from this source were $7,481,624 (*£1,496,325*). The *tax on national banks* is ½ of 1 per cent on the circulation. The *immigrant fund* is composed of a small tax on each immigrant since 1882; and the *tax on sealskins* is paid by the corporation to which the Alaska seal fisheries are farmed out. The Trust Funds (Department of State) provide a considerable sum, in 1904 $1,791,741 (*£358,348*). Some items are temporary, as the repayment of the loan to the Louisiana Purchase Exposition Company and the Spanish Indemnity.

II. EXPENDITURE.—The striking features in the national expenditure during recent years have been the increased naval and military outlay, the growth of the pension list, and the decrease of the interest charge for the public debt. From the end of the civil war to 1880 the *pensions* to survivors or their families varied annually from twenty

to thirty-five million dollars (*£4,000,000* to *£7,000,000*). In 1880 the classes were enlarged and the pensions jumped to $56,000,000 (*£11,200,000*). For the next eight years they varied from fifty to seventy millions of dollars, (*£10,000,000* to *£14,000,000*). In 1889 the old law was more liberally construed, in 1890 a new "dependent pension" law was enacted, and the pensions increased from $88,000,000 (*£17,600,000*) in 1889 to $107,000,000 (*£21,400,000*) in 1890, and to $159,000,000 (*£31,800,000*) in 1893. For 1904 they were $142,500,000 (*£28,500,000*). During the years 1898-1901, comprising the Spanish War, the

REVENUE FOR 1904.

From customs	$261,274,564	£52,254,913
From internal revenue	232,904,119	46,580,824
From sales on public lands	7,453,479	1,490,696
From profits on coinage, bullion deposits, &c.	6,373,396	1,254,679
From revenues of the District of Columbia	5,454,344	1,090,869
From fees—consular, letters patent, and lands	4,202,730	840,546
From sales of Indian lands, proceeds of Indian labour, &c.	3,112,720	622,544
From navy pension, navy hospital funds, &c.	2,570,073	514,015
From tax on circulation of national banks	1,836,639	367,328
From payment of interest by Pacific railways	1,782,469	356,494
From trust funds, Department of State	1,791,741	358,348
From immigrant fund	1,662,835	332,567
From customs and navigation fees, fines, penalties, &c.	831,572	166,314
From Soldiers' Home, permanent fund	687,653	137,531
From sales of government property	547,774	109,555
From judicial fees, fines, penalties, &c.	407,252	81,450
From sale of lands, buildings, &c.	252,549	50,510
From deposits for surveying public lands	205,757	41,151
From tax on sealskins	197,261	39,452
From reimbursement of loan to Louisiana Purchase Exposition Company	195,057	39,011
From licence fees, territory of Alaska	168,975	33,795
From sales of ordnance material	129,843	25,969
From depredations on public lands	101,128	20,225
From Spanish indemnity	57,000	11,400
From part payment Central Pacific railroad indebtedness	5,699,156	1,139,831
From miscellaneous sources	731,654	146,331
From post revenues	143,582,624	28,716,525
Total receipts	$684,214,373	£136,842,874

The expenditure for 1904 was—

For the civil establishment, including foreign intercourse, public buildings, Panama Canal, collecting the revenues, district of Columbia, and other miscellaneous expenses	$186,766,702	£37,353,340
For the military establishment, including rivers and harbours, forts, arsenals, sea-coast defences, and expenses of war with Spain and in the Philippines	115,035,410	23,007,082
For the naval establishment, including construction of new vessels, machinery, armament, equipment, improvement at navy-yards, and expenses of war with Spain and in the Philippines	102,956,101	20,591,220
For Indian service	10,438,350	2,087,670
For pensions	142,559,266	28,511,853
For interest on the public debt	24,646,490	4,929,298
For postal service	143,582,625	28,716,525
Total expenditure	$725,984,945	£145,196,989
Showing a deficit of	$41,770,572	£8,354,115

restoration of peace in the Philippines, and the campaign in China, 1900, military and naval expenses increased enormously, the former rising from $49,000,000 (*£9,800,000*) in 1897 to $230,000,000 (*£46,000,000*) in 1899, and the latter from $34,500,000 (*£6,900,000*) in 1897 to $64,000,000 (*£12,800,000*) in 1899. For 1898-1901 a total of $603,000,000 (*£120,600,000*) was expended on the army, and $238,000,000 (*£47,600,000*) on the navy. A result of the war will be to make expenditure for the army and navy permanently larger, and pensions also are likely to increase. For 1902-1904 the army cost $346,000,000 (*£69,200,000*), and the navy $253,000,000 (*£50,600,000*). On the other hand, the *interest charge* on the public debt has greatly diminished, in 1867 it was $143,781,592 (*£28,756,318*), and in 1904, $24,600,000 (*£4,920,000*).

The figures of receipts and expenditures for the fiscal year, 1904, are appended.

III. THE DEBT.—*The total funded debt* at the close of the civil war amounted to $1,109,568,191 (*£221,913,638*). In addition there was a large unfunded debt, funded during the next few years, which brought the total debt to a sum exceeding $2,800,000,000 (*£560,000,000*). The great refunding acts were those of 1870, 1881, and 1900. In 1870 the interest bearing debt consisted almost entirely of $1,934,696,750 (*£386,939,350*) 5 per cent and 6 per cent bonds. Under the act of 1881, all the 6 per cent bonds were redeemed by 1903 (except $26,466,000 (*£5,293,000*) Pacific railway bonds which are still outstanding); the 5 per cents were converted into 3½ per cents, then into 3 per cents, and finally redeemed in 1887; the 4½ per cents were re-

deemed in 1891, but $25,364,500 (*£5,072,900*) continued at 2 per cent till 1900; the 3 per cent navy pension bonds were redeemed in 1891. By the act of 1900 the 3 per cents of 1908 (Spanish War loan), the 4 per cents due in 1907, and the 5 per cents due in 1904, a total of $839,000,000 (*£167,800,000*), were refunded into new thirty-year 2 per cent gold bonds. The present interest bearing debt (September 1904) is as follows:—

2 per cent bonds, Redeemable 1930	$542,909,950	£108,581,990
3 per cent bonds, Redeemable 1908	77,135,360	15,427,072
4 per cent bonds, Redeemable 1907	156,593,650	31,318,730
Refunding Certificates, 4 per cent	28,770	5,754
4 per cent bonds, Redeemable 1925	118,489,900	23,697,980
	$895,157,630	£179,031,526

The debt on which interest has ceased since maturity is $1,662,220 (*£332,444*).

The Unfunded Debt.—The debt bearing no interest is—

United States notes	$346,681,016	£69,336,203
Old Demand notes	53,847	10,769
National Bank notes, Redemption Account	33,373,135	6,674,627
Fractional Currency (nominally outstanding)	6,869,250	1,373,850
	$386,977,248	£77,395,449

In addition to this the outstanding certificates and notes, issued on deposits of coin and purchases of silver, are—

Gold Certificates (acts of 1863 and 1882)	$528,491,969	£105,698,394
Silver Certificates (act of 1878)	474,322,000	94,864,400
Treasury notes (act of 1890)	11,966,000	2,393,200
	$1014,779,969	£202,955,994

The aggregate debt is thus: $2,298,577,068 (*£459,715,413*); against which the treasury holds in cash (money and bullion) $1,218,071,759 (*£243,614,351*); making a net debt of $1,080,505,309 (*£216,101,061*).

State and Local Finance.

(*a*) *Debts.*—In addition to the national debt there are three kinds of debt: state, county, and municipal debts. The *state debts* arose chiefly in the period 1830-1840, and were contracted for public works. During the past two decades the commonwealths have been diminishing their debts very quickly, and a considerable number are now entirely out of debt. Some still have a nominal debt, consisting of their own state bonds invested in so-called trust funds, the interest of which is devoted to education and other purposes. These states also are virtually out of debt. The few debts of any importance which still exist are found in the southern states, as a result of the civil war and reconstruction period. In 1890, the debt of the states and territories, over and above all resources, was $132,336,689 (*£26,467,338*) against $204,500,674 (*£40,900,135*) in 1880. The debt, less sinking fund alone, in 1890 was $223,107,883 (*£44,621,576*), of which $150,194,322 (*£30,038,864*) was owed by the southern states.

The *county debt* has somewhat increased, owing chiefly to the number of new counties. The county gross debt in 1890 was $145,693,840 (*£29,138,768*) as against $125,621,455 (*£25,124,291*) in 1880. The county net debt in 1890 was $115,224,885 (*£23,044,977*).

The *municipal debt* has also increased. But extravagant increase has been rendered impossible by the provisions in most of the state constitutions which limit local debts to a certain percentage—varying from 5 to 15 per cent—of the assessed valuation property. The debts can thus never increase faster than the wealth of the country. The gross municipal debt in 1903 was $1,425,841,585 (*£285,168,317*) as against $745,949,786 (*£149,189,957*) in 1890, and $695,494,741 (*£139,098,948*) in 1880. The sinking fund increased from $115,158,742 (*£23,031,748*) in 1880 to $147,181,191 (*£29,436,238*) in 1890, and to $291,396,061 (*£58,279,212*) in 1903. The net debt was $633,427,824 (*£126,685,565*) larger in 1903 than in 1880. The annual interest charge on combined state and local funded debts in 1890 was $65,541,776 (*£13,108,355*) or 5·29 per cent, as against $68,935,807 (*£13,787,161*), or 6·17 per cent in 1880.

(*b*) *Revenue and Expenditure.*—Owing to the separation of governmental functions, the expenses of the states are far less than those of the municipalities or the national government. The state expenses are mainly for education, charity, salaries of state officers, and militia. In the southern states we must add pensions, and in a few states expenses for public works. In the cities the expenses are far greater. The six largest states spent in 1890 $28,859,010 (*£5,771,802*). New York city alone spent $244,000,000 (*£48,800,000*) in city government in 1903. In 1902 the 175 largest cities, containing more than three-fourths of the urban population, paid $683,000,000 (*£136,000,000*) for ordinary expenses.

The state and local revenues are derived chiefly from taxation. Some of the states, as Texas, obtain a slight revenue from land sales. Many municipalities own their water works, and a few own gas and electric light works; but, except in one or two cities, no attempt is made to derive net revenues therefrom.

The system of taxation is based almost everywhere on the general property tax. In the southern states, and to a less extent in three or four northern and western states, we also find a comprehensive system of "license" or "privilege taxes" on most occupations. Income and stamp taxes are found in a few cases,

but the receipts are everywhere insignificant except in Pennsylvania, where the stamp taxes yield a fair revenue. Collateral inheritance taxes are found in a few of the eastern states, and a direct succession tax exists in New York. Special and general taxes on private corporations abound.

While the great tax is the general property tax, personal property has to a great extent slipped out of the assessment lists, and the tax falls principally on real estate. Thus in New York state personalty pays less than 10 per cent, and realty more than 90 per cent. The system, moreover, is greatly confused by the lack of uniformity in the different state tax laws. In some states debts are exempted, in others not; in some states mortgages are exempted, in others not. Real estate is generally taxed where it is situated; but personalty is taxed sometimes where it is situated, sometimes where the owner resides, sometimes in both places, and often in neither place. During recent years the difficulty of reaching personalty has led to a variety of new plans. These are as follows:—

1. *To enforce the personal property tax by more vigorous measures.* The so-called *listing system* requires every tax-payer to make a complete list of every article of his personalty under oath. This plan is much favoured by the farmers and has been introduced in several states. But it has not been very successful.

2. *To reach intangible personalty by a system of registration.* This has been adopted by Connecticut. Any one owning securities may have them registered in the treasurer's office, and by paying the "investment tax" will then be exempt from other taxation on the securities. This has been fairly successful; but is, of course, only a partial solution.

3. *To reach mortgages by declaring them to be realty, not personalty, for purposes of taxation.* This plan has been adopted in California, Oregon, Massachusetts, and Michigan. In these states mortgages do not follow the person of the holder according to the rule, *mobilia personam sequuntur*, but are taxable where the land is situate. The landowner is taxed on the value of the land less the mortgage; the owner of the mortgage is taxed on the value of the mortgage.

4. *To abolish the personal property tax and put the whole weight on real estate.* This plan is favoured chiefly by the followers of Henry George, who desires all taxes to be put on land values. It was tried in Hyattsville, Maryland, but was pronounced unconstitutional.

5. *To abolish the personal property tax, and to substitute for it the income tax.* This is a plan favoured by a few writers and officials. But the income taxes already existing, as in Massachusetts, Virginia, etc., are mere farces, and there is no likelihood of their being extended.

6. *To abolish the personal property tax and to replace it by state taxation of corporations and inheritances, leaving the real estate tax to the local divisions.* To this plan many of the states are gravitating. The general tax on corporations has been most fully developed in Pennsylvania and New York, but exists in whole or in part in many other states. Collateral inheritance taxes are found in several states, and the direct tax on successions to personalty has recently been introduced in New York. No satisfactory solution of the tax problems can be expected until joint measures are adopted by the commonwealths to regulate inter-state relations, and thus avoid double taxation. For most of the difficulties are referable to this source.

To state the entire burden of taxation resting on the American people is difficult. It depends on whether we include the fees from postal service, waterworks, licences, etc., among taxes. They certainly represent a charge upon the people. The figures of the twelfth census for the total ordinary receipts of the states and local divisions are published; and the work of the Census Bureau, established by the act of March 3, 1899, gives further information. According to a recent census bulletin the ordinary receipts of 175 principal cities in 1903 were $345,000,000 (*£69,000,000*). It may be assumed that the total city and town receipts in the United States in 1903 amounted to $430,000,000 (*£86,000,000*). The receipts of the federal government were $684,000,000 (*£137,000,000*). The commonwealth and county ordinary receipts were probably between $170,000,000 (*£34,000,000*) and $220,000,000 (*£44,000,000*). The total may be about $1,500,000,000 (*£300,000,000*), roughly representing the annual burden resting on the people.

The incidence of these charges is likewise difficult to determine. The bulk of the federal taxation would, however, rest on the consumer; while the bulk of the local and state taxation would rest on the owners of real estate. Local taxation consists largely of the tax on personalty and license taxes. For these points, with especial reference to American conditions, see Seligman, *The Shifting and Incidence of Taxation* (1892).

[Annual reports of secretary of the treasury, Washington. Annual and biennial reports of state treasurers, auditors, comptrollers, and city comptrollers. Publications of the Bureau of the Census Department of Commerce and Labour, Washington. Seligman, *Finance Statistics of the American Commonwealth* (1889).—Dewey, *Finance History of the United States* (1903).—Ely, *Taxation in American States and Cities* (1887).—Seligman, "The General Property Tax," and "The Taxation of Corporations," in *Political Science Quarterly*, vol. v. (also separately).—Adams, *Public Debts* (1888). Rosewater, *Special*

Assessments (*Columbia College Studies in History, Economics, and Public Law*, vol. ii., No. 3, 1893).

Among the reports of special commissioners on taxation may be mentioned those of New York (First and Second Reports, 1871-1872), Massachusetts (1875), West Virginia (1884), Illinois (1886), Connecticut (1887), Maryland (1888), Pennsylvania (1889), Maine (1890), Boston (1889 and 1891), New York (1893).] E. R. A. S.

FINE. 1. A payment to be made by way of punishment for an offence.

2. A payment to be made to a feudal lord on the alienation of land,—such payments still occur in the case of copyhold lands or freehold lands held of a manor.

3. A proceeding which, similarly to the proceeding by RECOVERY (*q.v.*), was formerly used for the purpose of barring an entail (see FEE TAIL). The act for the abolition of fines and recoveries (1833), which enables tenants in tail to recover the entail by the execution and enrolment of a disentailing deed, has abolished this procedure. E. S.

FINENESS OF COINS. The amount of pure or "fine" metal contained in a coin is expressed either by means of the ancient "carat pound" system or by the more modern millesimal method.

The *carat pound system* consists in recording the alloy as being so much better or worse than standard, and is founded on an ideal unit, the carat pound, which is divided into 24 parts called carats. British standard gold contains 22 carats of gold and 2 carats of copper or other alloying metal in every 24 parts. The carat is further subdivided into 4 "carat grains," and the carat grain into 8 parts, the smallest division of the carat scale being thus $\frac{1}{8}$th of a carat grain, or the $\frac{1}{7\,\frac{1}{8}}$th part of the carat pound. In order to attain a still greater degree of minuteness, the eighth part of a carat grain is further subdivided into $7\frac{1}{2}$ parts, or "excess grains." Each of these final divisions is thus the $\frac{1}{67\,\frac{1}{2}\,\frac{1}{0}}$th of the carat pound, and, as the troy pound also contains 5760 grains, each "excess grain" of gold beyond the last eighth in the assay report is reported as an "excess grain of gold in the troy pound."

Snelling, writing in 1766, says, in his *Doctrine of Gold and Silver Computations*, that, "by the word silver we understand not only the metal so called, pure and unmixed, but also when in a mass with copper; and if but one half, two-thirds, or any other proportional part of it be silver, yet the whole bears that name. The same is to be understood of gold, when by itself or in a mass with silver and copper together, or with either of them alone." . . . "This is the reason that inquiries are not made what quantity of fine gold or fine silver is contained in any mixture, which seems to be the most natural inquiry, but how much standard it holds." . . . "The assay master, in reporting the result of an assay, does not give the absolute fineness or the quantity of fine silver or fine gold present, but only the relative quantity or fineness, that is, how much the mixture is more or less than standard. In the case of gold of 20 carats fine (20 parts of pure gold in 24 parts of the alloy) the assayer puts down Wo ij., [which means *worse* (than 22) by 2 carats], and if it is 23 carats $3\frac{1}{2}$ grains fine, he puts down Br j. iij. ob," [which means *better* (than 22) by 1 carat $3\frac{1}{2}$ grains]. The sign *ob* represents an obolus or half a carat grain. In modern times, however, the final division has been $\frac{1}{0}$ of a carat grain. The carat pound system was in use at the royal mint till so recently as the year 1882, when the *millesimal method* of expressing the fineness of the precious metals was adopted. According to this system the metal is considered as being divided into 1000 parts, the proportion of fine to alloy metal being expressed in thousandths. Thus sterling standard gold, which was formerly referred to as containing 22 carats fine and 2 carats alloy, becomes "916·6 fine," and sterling standard silver is reported by the assayer as "925 fine."

Prior to the reign of Henry III. the only gold coins in use in England were pieces of pure metal known as byzants (coming originally from Byzantium), and florences (originally struck in Florence). The coins struck by Henry III. were also of pure gold. In the reign of Edward III. the standard was altered to 23 carats $3\frac{1}{2}$ grains fine and $\frac{1}{2}$ a grain of alloy. It was again reduced by Henry VIII. to 20 carats of gold and 4 of alloy. In his reign, however, crowns were coined of the standard of 22 carats of gold and 2 of alloy. This standard, known as "crown gold," was, in the reign of Charles II., finally adopted by act of parliament as the sole standard, and it has not since been altered.

The present standard of fineness for silver coins, 11 oz. 2 dwts. of silver and 18 dwts. of alloy (925 fine), was probably first introduced by the Saxons, but it has been subject to many changes. Henry VIII. greatly debased it, reducing it first to 10 ozs. silver and 2 ozs. alloy, and subsequently to 4 ozs. silver and 8 ozs. alloy. Edward VI. at first still further debased the silver coinage by reducing the silver to 3 ozs. only in the 12. Towards the end of this reign, however, the standard was slightly improved, and Elizabeth, in the second year of her reign, restored the fineness to its original standard, which has been maintained without alteration from that time to the present day.

The following list gives the fineness, expressed millesimally, of the standard coins of the principal countries of the world:—

(The coins which form the standard of value in France, Belgium, Italy, and Switzerland, will be found recorded under the head of the Latin Union.)

Country.	Gold Coins.	Silver Coins.	Fineness.

FINESCHI, F. VINCENZO (18th century), a Dominican, was keeper of the records in the convent of S. Maria Novella at Florence, and wrote on early famines in that city.

Istoria compendiata di alcune antiche carestie e dovizie di grano occorse in Firenze, cavate da un Diario MS. in cartapecora del secolo XIV. Firenze, Pietro Gaetano Viviani, 1767. A. B.

FINLAISON, JOHN (1783-1860), born and educated in Scotland, a civil servant and statistician of ability almost amounting to genius. He studied for the Scotch bar, but gave up the law and was employed by the admiralty from 1805 to 1822. In this service he effected a great saving by the reform of the system of accounts, and invented a system of digesting and indexing the admiralty records and correspondence—which had been almost inaccessible for want of arrangement—so perfect that it still continues in use, and has been adopted by several foreign governments. He also drew up an account of the French forces, 1811, the first navy list, 1814, and a register of all the officers in the navy, with their antecedents, for the use of the department. From 1822 to 1851 he was employed by the treasury as actuary and principal accountant of the check department of the national debt office, and his investigations into the subject of life annuities, which were being granted at a price much below their value, saved, it has been estimated, £3,000,000 to the country. In addition to the immense amount of labour entailed by his official work he was mainly instrumental in establishing pensions for widows and orphans in the civil departments of the navy, 1812 to 1819. His close study of the principles of life assurance, his most original work, carried on during these years, led to his help being sought in the formation of many friendly and assurance societies, which would not otherwise have been placed upon a sound footing. In connection with the compensation to slave-owners at the emancipation of slaves, 1833, he made computations of the duration of slave and creole life; in 1835 to 1837 he drew up reports for the ecclesiastical commissioners on church leases, church rates, and other similar subjects; and he was consulted on the system of registering births, marriages, and deaths established in 1837. From 1847 until his death he was president of the institute of actuaries; yet, in spite of such appreciation his incredible industry and invariable uprightness did not always save him from calumny and neglect.

Finlaison wrote a continuation of Sir R. Yorke's *Naval History* down to 1780.

[*Assurance Magazine*, April 1862, gives the fullest account.—Southwood Smith's *Philosophy of Health.*—Walford's *Insurance Cyclopædia*, vol. iii.—*Dictionary of National Biography.*—*Times*, 23rd April 1860.—For Finlaison's views on the organisation and management of insurance societies, see his *Evidence before the Select Committee on Assurance Associations*, 1853.] E. G. P.

FIORENTINO, NICOLA, a Neapolitan, wrote (18th cent.) on the utility and importance of agriculture, and against protective duties, especially in an agricultural nation, where town industries ought not to be encouraged more than country ones, as foreign competition compels manufacturers to improve, and supplies the funds needed by agriculture.

Riflessioni sul Regno di Napoli, di Nicola Fiorentino, Napoli, presso de Bonis, 1794. A. B.

FIRE INSURANCE. See INSURANCE.

FIRM. "Partners are called collectively a firm. . . . Commercial men and accountants are apt to look upon a firm . . . as a body distinct from the members composing it. Hence in keeping the partnership accounts the *firm* is made debtor to each partner for what he brings

into the common stock, and each partner is made debtor to the *firm* for all he takes out of the stock. . . . In taking partnership accounts and in administering partnership assets, courts have to some extent adopted the mercantile view, and actions may now be brought by or against partners in the name of their firms; but speaking generally the firm as such has no legal recognition. The law, ignoring the firm, looks to the partners composing it. Any change amongst them destroys the identity of the firm; what is called the property of the firm is their property; and what are called the debts and liabilities of the firm are their debts and their liabilities. In point of law a partner may be the debtor or the creditor of his co-partners, but he cannot be either debtor or creditor of the firm of which he is himself a member" (Lindley on *Partnership*, 7th ed. pp. 127, 128).

In addition to the difference between the mercantile and legal conception of a firm pointed out as above by Lord Lindley, there is a difference as to the use of the term between lawyers and traders which must be borne in mind. While to a lawyer the word "firm" is the collective designation of partners trading together (see Partnership Act, 1890, § 4), laymen generally employ it for the purpose of describing the name under which a business is carried on, and which in legal language is called the "firm name" (Partnership Act, 1890, *ibid.*) Thus in ordinary language we may speak of the firm of a single trader while, according to legal terminology, there can be no firm, unless two persons at least are trading together. The word "firm" in Scotland and the German word *firma* is used in the sense of trade-name, both in legal and mercantile language ("the firm of a trader is the name under which he trades, and which he uses for his signature in the course of his business"—German Mercantile Code, § 17). The French word *raison sociale* only applies to partnerships; and in Italian there are two distinct words—*ditta*, which is the trade name of a person trading without any partners, and *ragione sociale*, which is used in the case of partnerships.

It would be a great convenience for bankers and traders generally if there were a public register of firms (in the sense of trade names) as in other countries, it being often most difficult to find out who carries on business under a given name—a circumstance which has frequently been taken advantage of for fraudulent purposes. A register of firms is more necessary in this country than on the continent (where it generally exists), because there is much greater freedom here than elsewhere in the choice of trade names, inasmuch as traders may at their option carry on business under their own names or under those of other persons, or under entirely fictitious names, subject to the one condition only that they do not interfere with any existing right. The question as to the circumstances under which the use of a firm name is deemed an interference with existing rights is too complicated to be discussed in this place; the following recent cases throw light on the subject: Levy *v.* Walker, 10 Chancery Division, 436; Gray *v.* Smith, 43 Chancery Division, 208; Thynne *v.* Shore, 45 Chancery Division, 577) (see PARTNERSHIP; STYLE OR TRADE NAME). According to Scotch law a partnership forms a separate legal person like a corporation.

E. S.

FIRMIN, THOMAS (1632-1697), son of Henry Firmin and Prudence his wife, was born at Ipswich. He started business with a capital of £100, and twenty years later (1676) he is said to have been worth £9000. His philanthropic schemes are of some importance in the economic history of England for the light they throw upon the condition of the working classes at the end of the 17th century. After the Fire of London, Firmin built a warehouse for storing corn and coal, to be supplied to the poor at reasonable rates,—a scheme which recalls the practice of the city companies during the 15th and 16th centuries. His most important undertaking, however, was his "workhouse" which he built in Little Britain for the employment of the poor in the linen manufacture. The broad outlines of this scheme were suggested by a similar one which had been tried by B. GOUGE in the parish of St. Sepulchre. Two years later (1678) Firmin unfolded his plans for dealing with poverty in his pamphlet, *Some Proposals for the employment of the Poor and for the prevention of Idleness and the consequence thereof, Begging, etc., in a letter to a Friend by T. F.*, London, 4to, 2nd edition, 1681, 8vo, reprinted in 1787 in a collection of pamphlets on the poor.

Firmin's proposals were (1) to set up in every parish a school "in the nature of a workhouse" in which the children of the poor should be taught spinning, weaving, silk-winding, stocking-knitting, etc.; (2) to provide home work of the same kind for poor women; (3) to erect workhouses for the reception of the aged poor; (4) in addition to the churchwardens, to appoint "fathers of the poor" in every parish to administer poor relief. In his own "workhouse" the children began work at 5 or 6 years of age. He found that they had to work 16 hours a day to earn 6d., and instead of recreation two hours were spent on their "education." Firmin was of opinion that "poor children that must be put out to poor trades, where they must work hard and fare hardly," should not be fed with white bread or taught farther than was necessary for such trades. He supplemented the miserable earnings of those employed in his workhouse, sometimes from 1600 to 1700 in number, with gifts of food and clothes. His scheme involved him in heavy losses. In 1690

it was taken up by the patentees of the linen manufacture, who appointed him overseer. But they were unsuccessful and unable even to pay Firmin his promised salary. He therefore took up the cause again and is said to have made it "bear its own charges." According to his partner he might have left an estate of at least £20,000, if he had not bestowed so much upon public and private charities. These reduced it to one-sixth of that amount. In addition to his "workhouse," Firmin took great interest in the relief of poor debtors and other philanthropic schemes.

[Full details of Firmin's life are given in the *Dictionary of National Biography*. There is an interesting account of his workhouse in *The Life of Mr. Thomas Firmin, late citizen of London. Written by one of his most intimate acquaintance. With a sermon on Luke x. 36, 37. Preached on the occasion of his death.* London, 1698, reprinted 1791, 12mo. *Vide* also M'Culloch's *Literature of Pol. Econ.*—Eden's *State of the Poor*, vol. i.]

W. A. S. H.

FIRST-FRUITS AND TENTHS. At the time when the papal authority was at its height, the popes laid on the clergy the taxes known as first-fruits and tenths. The first-fruits were the first year's income of a benefice paid by the new incumbent. They were also known as ANNATES (Lat. *annus* a year). The tenths were 10 per cent of the income of the benefice paid in subsequent years. After Henry VIII. had quarrelled with the pope, the first-fruits and tenths payable by the English clergy were transferred to the crown by an act of 1534. The annual produce of these taxes then amounted to £14,000. It was expended on secular objects until the reign of Queen Anne, who was persuaded by Gilbert Burnet, the celebrated bishop of Salisbury, to devote it to the augmentation of poor livings. An act of 1703 empowered the queen to incorporate the persons whom she should appoint to be trustees of the fund, and relieved them from the restraints imposed by the statute of mortmain, thus enabling them to receive gifts of land.

The tenths and first-fruits continue to be levied upon the ancient valuation, so that their proceeds have not increased. Since 1703 the fund has been augmented by parliamentary grants and by private liberality, but it is still known as Queen Anne's Bounty. F. C. M.

FISCAL SYSTEMS. See TAXATION.

FISC, a name sometimes given in modern states to the national as well as to the private royal treasury, though derived from the Latin *fiscus*, which was originally the Roman treasury under imperial control, as distinct from the *ærarium* or state-chest under control of the senate. (See FISCUS.)

In the feudal language of the middle ages the domain of the crown was sometimes called *fiscus regius*.

[Madvig, *l'Etat Romain*, transl. Morel, tome 4.—Smith, *Dictionary of Greek and Roman Antiquities*.—Wright, *Universal Pronouncing Dictionary*.] E. G. P.

FISCUS. The treasury of the Roman emperor. Under Augustus and the early emperors the administration was divided between the senate, representing the *populus*, and the emperor. Consequently there were two treasuries, the *Ærarium Populi*, an institution of the free republic, and the *Fiscus Cæsaris*, established by Augustus. When the empire grew into an autocratic form of government, the *Fiscus Cæsaris* became the only treasury of the Roman state. E. A. W.

FISH-SILVER, probably a commuted payment for fish due in feudal times to the lord of the manor. Seebohm (*English Village Community*, pp. 44, 58), has mention of a "fish-penny" and a "fish-fee."

[Vinogradoff, *Villainage in England*, 1892, p. 291.] E. G. P.

FITZHERBERT, SIR ANTHONY (1470-1538), was a son of Ralph Fitzherbert of Norbury, Derbyshire, and of Elizabeth, daughter of John Marshall of Upton, Leicestershire (Nichols, *Leicestershire*, IV. ii. 957). According to Anthony Wood he went to Oxford, and then to Gray's Inn; 18th November 1510 he was called to the degree of sergeant-at-law, 24th November 1516 was appointed king's sergeant, and in 1516 became a justice in the court of Common Pleas. From 1509 to 1512 he was Recorder of Coventry, when pressure of work forced him to resign that post (*Coventry Leet Book*, ff. 304 b, 309, 311). Anthony Wood states that he was knighted about 1516, but gives no authority, and the earliest mention of *Sir* A. Fitzherbert seems to be in a State Paper of February 1522, and is not found again until the close of 1524, after which he is more commonly described as a knight. From 1509 to his death frequent mention is made in the State Papers of his appointment to serve on commissions of the peace, and of gaol delivery, for the northern and midland circuits, as well as on special commissions, and it is from these papers that the outline of his career must be drawn.

In 1514 he was sent as commissioner to Ireland together with Dr. Denton, dean of Lichfield, and Sir Ralph Egerton, to attempt a settlement of affairs, a work which seemed at the time so successfully accomplished that the commissioners received Henry VIII.'s hearty thanks on their return in the autumn. In June 1529 Fitzherbert formed a member of the commission appointed "to hear and determine causes moved before the king in Chancery, and committed to them by Thomas, Cardinal of York" (*Letters and Papers Hen. VIII.*, iv. iii. 2502), while on 1st December 1529 he signed the articles preferred against Wolsey by the Lords.

one indictment in which was that Wolsey had "removed into Chancery indictments against his officers for taking 12d. in the pound for probation of wills, and rebuking Mr. Justice Fitzherbert" (*Letters and Papers Hen. VIII.* iv. iii. 2713). Fitzherbert was among the judges who attended Anne Boleyn's coronation on 1st June 1533 (*ib.* vi. 263), and in July Cromwell addressed a letter to him concerning "the title of Antony Stydolffe, my ward," which he fears "may be prejudicial to me," and requires Fitzherbert "to stay the trial till he has further knowledge" (*ib.* vi. 380). In November of the same year he is mentioned as a member of the Council at Ludlow with a yearly fee of £10.

In June 1535 he sat on the tribunal by which Bishop Fisher and three Charterhouse monks were tried and convicted of high treason (*ib.* viii. p. 350), and in July took part in the trial of Sir Thomas More. Again on 13th May 1536 Sir Anthony was one of those who received a mandate to return all indictments found against Anne Boleyn and Lord Rocheford (*ib.* x. p. 361). He was written to about the Northern Rebellion, and was at Warrington in February 1537 for the trial of cases connected with it, while about the same time he took part in the business connected with the surrender of the monasteries of Whalley and Furness. His activity in the North was so great that he was "highly commended for his diligence" by Sussex, who wrote to Cromwell that "he cannot be spared from hence."—We hear of him next on the king's Council in Wales (*ib.* xii. ii. 321), but shortly after, while still in active service as a judge, he died 27th May 1538, and was buried at Norbury.

Fitzherbert married 1st, Dorothy, daughter of Sir Henry Willoughby of Woolaton, Notts.; 2nd, Matilda, daughter and co-heiress of Richard Cotton of Hempstall Ridware, Staffs., by whom he had five sons and five daughters, according to an epitaph preserved in the Le Neve collection (Harl. MSS. 3609). Although Fitzherbert did not enter into possession of the manor of Norbury until the death of his brother John in 1531, he certainly held land in the counties of Stafford, Warwick, Oxford and Northampton acquired by purchase and through his wife from 1503 onwards (unpublished family papers). From the notices scattered through the State Papers, Fitzherbert seems to have been a man of weight in practical matters, but he is best known to us as a legal writer. His chief works are (1) *La Graunde Abridgement*, first published by Pynson in 1514, an attempt to systematise existing law in the form of a digest of the year-books; (2) *La Novelle natura breuium* (1534); (3) *L'office et auctoryté des Justyces de peas*, first published by R. Redman in 1538, who also issued a translation of it known as the *Newe Boke of Justices of the peas* by A. F. K. That part which treats of "l'office de visconts bailiffes escheators constables, coroners" appeared later as a separate tract (Middleton, 1545; R. Crompton, 1583); (4) *Diversite de courtes et lour jurisdictions et alia necessaria.* (Redman, 1523; Pynson, 1526, though Coke, *Institutes*, iv. c. ix. ascribes it to 21 Hen. VIII.) But beside these and possibly other legal writings, two works on agriculture are generally, and probably with reason, ascribed to Fitzherbert.

(1) *The Boke of Husbandrie* (Pynson, 1523; Treuerys, 1525?; Berthelet, 1532, 1534, 1546, 1548; Walle, 1555?; M. Marshe, 1560?; Awdeley, 1562, 1576; White, 1598; Bathurst and Newbery, 1767; Trübner, 1882) was a practical manual for the working farmer, and the numerous editions through which it passed during the 16th century afford some evidence of the estimation in which it was held, and of the need it supplied. It is generally considered the earliest treatise in English on agriculture, if we except the translation of Walter of Henley's *Husbandry*, attributed to Grosseteste.

(2) *The Boke of surueyinge and improuements* (Pynson, 1523; Berthelet, 1539, 1546, 1567; Marshe, 1587; Bathurst and Newbery, 1767) was a more technical work, based upon the statute *Extenta Manerii*, and written for the benefit of lords of manors. It describes how the survey of a manor should be taken, how its resources might be increased, and in what relations lord and tenants stand to one another. The stress laid on the advantages of enclosures, the minute directions concerning the management of sheep, the warning against the raising of rents, the incidental notices marking an increase in general prosperity, and the plea for the abolition of the still existing evil of villainage are interesting points on which a student of Tudor times may learn much from Fitzherbert, while a comparison between his experience and the practice of the 13th century, as described by Walter of Henley, is of value.

Some writers have maintained that these works on agriculture were not written by Sir Anthony Fitzherbert, but by his brother John, though the latter is not known to have written anything else. It is said that Sir Anthony's professional engagements could not have allowed him to "exercise husbandry forty years" as alleged in the *Boke of Husbandrie*. Fitzherbert as a judge must, however, have had much leisure time, which he may well have given to agricultural pursuits; and family papers show that he added considerably to his landed possessions. The difficulty presented by a comparison of his age with the date of publication of the *Boke of Husbandrie* (1523) is lessened when we remember that Fitzherbert himself merely says that he has been "an householder this forty years and more." It is Berthelet, the printer, who says that he had "exercised husbandry forty years." The fact

that he is called "mayster" instead of "Sir Anthony" in the printer's note also seems an objection of little weight. It is not known exactly when he was knighted, it was certainly before February 1522, but since, as already noticed, the State Papers, with one exception use the title "Mr." until the close of 1524, and frequently afterwards, it is not surprising to find that a printer does the same when the title "Sir" would have been more correct.

The technical character of the *Boke of Surueyinge* points to its authorship by a man intimately acquainted with the law, while various indications in the *Boke of Husbandrie* show that the writer was something more than a farmer; he was clearly a country gentleman who could make experiments, and a man of scholarly tastes who could quote the Scriptures and the Fathers as readily as the statute book.

Professor Skeat, who has discussed the matter fully in the introduction to his edition of the *Boke of Husbandrie*, may safely be followed in his conclusion that Sir Anthony Fitzherbert was the author of these books, until more convincing arguments to the contrary are forthcoming.

[Copy of brass on tomb, Brit. Mus. Harl. MSS. 3609.—Wood's *Athenæ Oxon.* (Bliss).—Nichols's *Leicestershire*, iv. pt. ii.—Douthwaite's *Gray's Inn.—Notes and Queries*, 6th ser. ii. iii. iv.—Ames's *Typogr. Antig.* (Dibdin), ii. iii. iv.—Dugdale's *Orig. Jurid.—Letters and Papers For. and Dom. of the reign of Hen. VIII.*—Skeat's *Introduction to the Boke of Husbandry* (Trübner, 1882).—*Coventry Leet Book* (Town Clerk's Office, Coventry).] E. A. M.

FIVE-FRANC PIECE. Standard gold as well as silver coin of the countries forming the "Latin" Monetary Union (France, Belgium, Italy, Switzerland, and Greece). *Gold*: weight, 24·89 grains; fineness, 900; value in gold (916·6 fine at £3 : 17 : 10½ an ounce), 3s. 11½d. *Silver:* weight, 385·81 grains; fineness, 900; value in silver (925 fine at 5s. 6d. an ounce), 4s. 3½d. F. E. A.

FIVE-POUND PIECE. English standard gold coin, provided for in the first schedule to the Coinage Act, 1870, but not actually coined for circulation until 1887, on the occasion of the jubilee of Queen Victoria; weight, 616·37 grains; fineness, 916·6. A further issue of these coins was made in 1893, and another with the effigy of King Edward VII. in 1902. F. E. A.

FIX, Théodore (1800-1846) born at Soleure (Switzerland), died at Paris. He migrated at an early age into France, where he first carried on the profession of a land surveyor, and then occupied himself with translating German works into French. This last-mentioned employment led to his forming a taste for economic science. He obeyed this call and founded, in July 1833, the *Revue mensuelle d'économie politique*, which was the forerunner of the *Journal des économistes*. Fix's review, however, was very coldly received by the public—though he had the assistance of Buret, Blanqui, Rossi, Sismondi, and others. This periodical came to an end at the close of the year 1836. Fix then worked on several journals, the *Siècle*, the *Quotidienne*, the *Constitutionnel*, and especially on the *Journal des économistes*. In 1840 his essay, called *Un mémoire sur l'association des douanes allemandes*, won him a prize from the Academy of the moral and political sciences. After this, Fix, though never elected a member of the Institute, was employed in working on the report on the progress of sciences since the Revolution—a work which the Institute had undertaken. Finally, in March 1846, but a few months before his death, Fix completed and sent to the printer his *Observations sur l'état des classes ouvrières*, 1 vol. 8vo, a very solid and well-written monograph, full both of common-sense and of learning, and distinguished by a high standard of enlightened intelligence. It may be read at the present day with pleasure.

[See also J. A. Blanqui, *Histoire de l'économie politique en Europe, depuis les anciens jusqu'à nos jours.*] A. C. f.

FIXED AND FLOATING CAPITAL. Adam Smith drew a distinction between capital which yielded a profit without passing from one owner to another, and capital which did not. This distinction—which is really one between food and fuel for the support of labour and all other kinds—was modified by Ricardo into one between "goods of slow consumption" and those which "require to be frequently reproduced"; a discrimination which does not, on the face of it, profess to be scientific, and about the usefulness of which he himself was dubious. Mill, following the same train of thought, formulated the recognised classical division between fixed and circulating capital in these terms: "Capital which fulfils the whole of its office, in the production of which it is engaged, by a single use, is called circulating capital; capital which exists in any durable shape, and the return to which is spread over a period of corresponding duration, is called fixed capital." According to these definitions fixed capital is practically invested capital, and comprehends machinery, houses, public works, railways, canals, improvements to land, and anything productive which exists in a durable shape. Circulating capital, on the other hand, comprehends raw material, metals and minerals, the actual produce of land, and all that is set aside for the sustenance of labourers. Money can hardly be placed in either class; it is generally placed in the latter, although it does not fall within Mill's definition. The term "circulating" is not a very happy designation for this sort of capital; because by hypothesis it does not circulate, but is, on the contrary, consumed in a single use. The term "floating capital'

seems to be better adapted in describing the class of commodities in question.

There are two other divisions of capital, both of which ought to be noticed, as they run on lines very nearly similar to that which discriminates between fixed and floating capital. One is that between capital which directly sustains labourers, called wage-capital, and capital which only indirectly aids labourers, called auxiliary capital. The only practical difference between wage-capital and floating capital is that the latter includes raw material, which is classed as auxiliary. The other division of capital is that into specialised and non-specialised capital. Fixed capital, with the exception of houses, is generally properly to be classed as specialised; but the line of demarcation between these last-mentioned classes of capital is not to be defined with accuracy, any more than that between specialised and non-specialised labour. There is little to choose between these three classifications of capital; but that which forms the subject of the present article has come down from the earlier English economists, and is the most commonly employed.

The progress of industry is, speaking generally, marked by the increasing ratio which fixed capital bears to floating. Fixed capital really represents the saving, or foresight, which is of the essence of the creation of nearly every form of capital. On pasture and agriculture there was formerly little fixed capital employed, but this gradually increases; and in all other industries the tendency to increase the quantity of fixed capital is very great. The most striking result of this progress is, that the proportion of industries which exist for the purpose of constructing fixed capital—*i.e.* making raw material (floating capital) into machinery—constantly increases. It is this, along with other causes springing essentially from the same source, that assists the phenomenon of the slow depletion of rural districts and growth of towns and large villages. There is therefore, while the process is going on, a gradual but continuous displacement of labour which in normal periods passes unnoticed and creates little disturbance. A sudden conversion of floating into fixed capital on a large scale, however, has always a very serious effect, at least temporarily, on labour; and this at many periods has caused new machinery to be unpopular with the working classes. There are two ways in which a conversion such as that mentioned affects labour. If a large quantity of capital is withdrawn from agriculture, and invested in machinery on permanent works, (the illustration given by Professor Fawcett, *Manual of Political Economy*, ch. iv.), there is not the same quantity of the annual return from the converted capital available for consumption. It must be remarked that this result can only be temporary. In the long run, floating capital is increased by the growth of fixed capital, but at a much slower rate, and it is liable to great fluctuations, as it depends on the continued existence and success of the industries in which the fixed capital is invested. The other manner in which labour is affected by a great conversion of floating capital is this: such a change means in effect the specialisation of a quantity of capital, and as specialised capital generally employs specialised labour, the workmen have to learn to change their business if they want to get employment. The demand for skilled labour increases suddenly, and the unskilled man suffers.

A country which possesses a great stock of fixed capital has the main element of financial strength, and the chief contributor to national credit. It may be observed, however, that when a country comes to be the scene of a war, its loss, and the consequent distress of its inhabitants, are greater where much fixed capital exists. The destruction of a harvest is the destruction of a year's agricultural income; the breaking-up of machinery and works is a breach made in national capital.

[Adam Smith, *Wealth of Nations*, bk. ii. ch. i.—Mill's *Principles*, and *Unsettled Questions in Political Economy*, essays iii. and v.—Marshall's *Principles of Economics*.—Marx, *Das Kapital*.—Cairnes, *Leading Principles*.] M. G. D.

FIXED INCOMES do not afford a constant benefit to the recipients when the value of money changes. Incomes may be thus classified according to the degree in which they are affected by a change in the value of money (Jevons, *Currency and Finance*, p. 96). (1) Incomes derived from funds, annuities, mortgages, etc., where the whole loss or gain consequent on depreciation or appreciation falls upon the holder. (2) Incomes made up of "fixed charges established by law or custom or convenience, such as the fees of lawyers, physicians, etc." The increase of business consequent on a virtual reduction of charge may here make some compensation, as in the case of traffic increasing with the diminution of tolls. (3) Incomes "entirely independent of the value of gold," such as those of manufacturers, merchants, artisans, etc.; from which class, however, must be excepted salaries and wages which, though not fixed, are slow to move.

To correct the evils incident to the fixity of incomes—the loss to the recipient in case of depreciation, to the community in case of appreciation—is one of the objects proposed by schemes designed to obviate the change in the value of money, as CORN RENTS, and a TABULAR STANDARD. (See also INDEX NUMBERS.)

F. Y. E.

FIXTURES. The older law, both of England and Scotland, allowed no exception to the maxim that whatever was fixed to the soil went with it. Accordingly, every object, even

though originally movable in character, that had once been fixed to land or to a building, became a part of that land or building, and could not be removed at the will of the person who had fixed it. It thus became a fixture, the property of the landlord in the same sense as the rest of the land or building. But between things fixed to the soil, so as to render the premises complete and ensure the appropriate use of them; things difficult to move on account of their weight; and things temporarily attached for convenience' sake, with no intention of transferring the property in them, it became difficult to distinguish, and the maxim was unduly harsh in its operation. The early rules of law remain on the whole in force in questions between heirs-at-law and personal representatives, except in particular cases where such objects as mirrors, pictures, tapestries, and the like have been held not to have been fixtures, and between personal creditors and mortgagees. As between lessors and lessees, however, there has been a considerable relaxation of the older rules; and the rule seems now clear in England, not quite so clear in Scotland, that fixtures put up for trade purposes or for domestic use may, as against the lessor, be removed by the lessee, or severed from the tenement, and that they thereupon regain their character as movables and as the personal property of the lessee; provided that what he so does he must do during the term or during the continuance of his possession as tenant, and that the tenement is not to be injured or impaired in its use by the removal. Such fixtures are called "Tenants' Fixtures," while those which must remain attached to the Freehold are called "Landlords' Fixtures." This relaxation was not effectively extended to agricultural tenancies until the passing of the Agricultural Holdings Act of 1883, by which it was provided that agricultural fixtures or buildings, for which the tenant was not entitled to compensation under the act, or which he was not bound by his agreement to put up, or had not put up instead of some fixture or building belonging to the landlord, might be removed by the tenant before the end of his tenancy, on condition that he had paid his rent, etc.; that no avoidable damage was done; that any actual damage was made good, and that notice was given and an option given to the landlord to purchase the fixtures or buildings at a valuation. A. D.

FLEETWOOD, WILLIAM (1656-1723),—the first English collector of statistics of prices,—became fellow of King's College, Cambridge; gained reputation as a preacher with strong Whig sympathies, and was appointed successively canon of Windsor (1702), bishop of St. Asaph (1708), and bishop of Ely (1714).

In 1707 Fleetwood published anonymously his *Chronicon Preciosum; or an Account of English Money, the Price of Corn and other Commodities for the last 600 years; in a Letter to a Student in the University of Oxford.* The question had been presented to him how far the statutes of a certain college (founded between 1440 and 1460), which vacated a Fellowship if the Fellow had an estate in land of inheritance, or a perpetual pension, of five pounds per annum, were binding in conscience. Fleetwood answered that this rule must be interpreted according to the changed value of money; and the purpose of his book was to determine what that change had been. He concluded that "£5 two hundred and sixty years ago, was equivalent to £28 or £30 now." But his treatise took a wider range; it brought together all the information he could find on the values of money and the prices of commodities during the Middle Ages in England; and it is still well worth consulting. His figures were taken almost exclusively from chronicles; but he clearly foretold such inquiries as those of Mr. Thorold Rogers. "The Gentlemen of each University," he remarked, "will have it in their Hands to make what Amendments they shall see good, out of their old *Rolls* and *Bursars' Accounts;* which I look upon as the most sure Guides in Enquiries of this Nature; because our General Histories do mostly give us the Prices of Things which are *Extraordinary*, either for *Cheapness* or for *Dearness.* Whereas the *College Accounts* deliver faithfully the *ordinary* and *common* Price of most Commodities and Provisions."

Fleetwood's sermons frequently dealt with subjects of current interest. Thus in 1694 he preached a *Sermon against Clipping* before the Lord Mayor at Guildhall Chapel, wherein he considered "First, The Use and Necessity of Money to the carrying on the Trade and Commerce of the World; Secondly, the Mischiefs of corrupting and debasing Money, the Coining of bad Metal, or the clipping and stealing from good; Thirdly, the Reasonableness and Justice of the Laws which punish such Offenders. So also he published in 1720 (during the South Sea Panic) a *Sermon*, preached some years before to a City congregation, *On the Justice of Paying Debts.*

A Complete Collection of the Sermons, Tracts, and Pieces of all kinds that were written by . . . Dr. William Fleetwood, was published by subscription in 1737. W. J. A.

FLETCHER, ANDREW (1655-1716), of Saltoun, published a remarkable discussion of pauperism in Scotland at the end of the 17th century (*vide* the *Second Discourse*, etc. in *Two Discourses concerning the affairs of Scotland*, Edinburgh, 1698; reprinted in Fletcher's *Political Works*, London, 1737, 8vo). He points out that the bad seasons of 1695-1698 were a special cause of poverty, but he attributes its origin to the church, "which encouraged setting slaves at liberty." . . . "Provisions by hospitals, almshouses, and the contributions of

churches or parishes, have by experience been found to increase the numbers of those that live by them. And the liberty every idle and lazy person has of burdening the society in which he lives, with his maintenance, has increased the numbers to the weakening and impoverishing of it: for he needs only to say that he cannot get work, and then he must be maintained by charity" [p. 129]. Then, regarding "not names, but things," Fletcher expresses the opinion that slavery is preferable to a bad system of workhouses. While he does not defend "any of those bad and cruel regulations about slaves," he "proceeds to explain under what conditions they might be both good and useful, as well as I think they are necessary in a well-regulated government." According to his scheme the master is not to have power over the slave's life, or for mutilation or torture. The slave, his wife and children, are to be provided with clothes, food, and lodging, to be educated at the master's expense, and to have Sunday holidays. Except in matters relating to their duty as servants they are to be under the protection of the law and not subject to the will of their masters. They are not to possess property, and they may be sold, *i.e.* Fletcher explains, their services may be alienated without their consent. He proposes to compel "every man of a certain estate" to take a proportionate number of vagabonds on those conditions and to set them to work. Under such a system he maintains that they would be better off than those who "having a power to possess all things, are very often in want of everything."

[A full life of Fletcher is given in the *Dictionary of National Biography*, vol. xix.] W. A. S. H.

FLEYLAND is satisfactorily explained by Vinogradoff (*Villainage in England*, p. 170) as land held by the villein tenure of agricultural work (*ad furcam et flagellum, i.e.* by pitchfork and flail), not by payment of rent. E. G. P.

FLOATING CHARGE is the name given to the general charge of the undertaking of a company frequently given in favour of debenture holders (see DEBENTURE; DEBENTURE STOCK). The expression "*floating* charge" implies that it does not attach to any specific property but to all the property held by the company at any particular moment subject to the company's right to dispose of it in the ordinary course of their business. It is only in case of default or liquidation proceedings that the charge becomes effective. A receiver may then be appointed who takes possession of all the assets, and the general creditors will be shut out. A floating charge, like all other mortgages, ought to be registered in the company's register of charges (Comp. Act, 1862-73), but as the omission to register does not entail any consequences except the payment of certain penalties by the parties responsible for the omission (Wright *v.* Horton, 12 Appeal Cases, 371), the creditors of a company can never know whether, in the case of a winding up, their claims will not be frustrated by debenture holders, the legislature having given additional facilities for the creation of secret charges by declaring that the Bill of Sale Act of 1882 (see BILL OF SALE) does not apply to the debentures of a company. Up to recent times creditors who were secured by a specific mortgage of any part of a company's property were comparatively safe, but the ingenuity of company lawyers has found a new method of defeating their claims, as well as those of unsecured creditors, by inserting an additional clause in debentures by which the company undertakes "not to create any mortgage or charge in priority" to the debentures in question. E. S.

FLOATING DEBT. The expression "Floating Debt" in state finance is used as equivalent to "unfunded" and opposed to "funded debt." The floating debt of a state is generally intended to be repaid within a comparatively short period, but it may also be raised in that form in order to be converted into funded debt at a subsequent period. A part of the floating debt of the United Kingdom consists of temporary advances required for the supply services in anticipation of revenue payable at a later period within the same financial year, but it also happens that expenditure is incurred for objects for which an addition to the funded debt does not seem justified, but which cannot conveniently be raised out of one year's revenue, and in such cases the creation of a floating debt repayable within a fixed number of years is a useful expedient. Thus for instance the Naval Defence Act 1889 provides that the sums required for the purpose of building certain vessels may be raised by the creation of floating debt repayable within seven years.

A good recent instance of the creation of floating debt, subsequently converted into funded debt, was the issue of exchequer bonds, for the purpose of paying off holders of consols who were unwilling to convert under Mr. Goschen's Act; their bonds were afterwards, through the operation of the National Debt (Conversion of Exchequer Bonds) Act 1892, exchanged against a charge in favour of the holders which now forms part of the funded debt. The effect of the operation will be seen by comparing on the table given below the respective amounts of funded and unfunded debt for 1892 and 1893.

The floating debt consists of advances made by the Bank of England, exchequer bonds repayable within a fixed number of years, interest being payable at fixed intervals in the meantime, and treasury bills repayable at much shorter periods and issued at a discount in the same way as mercantile bills. Terminable annuities are also in a certain sense part of the floating debt; they are partly used like

exchequer bonds for the purpose of spreading expenditure over a number of years, and partly also for the purpose of paying off funded debt. As the National Debt is to a great extent held by public bodies, a conversion of funded into unfunded debt for the purpose of ultimate repayment can always be easily arranged if the state of the finances allows such an operation. The proportion of floating to funded debt is shown below. The unfunded debt rose greatly after the South African War (1899-1903):—

Year.	Funded debt.	Capital value of terminable annuities.	Unfunded debt.
	£	£	£
1836	760,295,000	60,698,000	30,083,000
1843	774,859,000	48,112,000	18,684,000
1853	764,541,000	31,862,000	17,743,000
1863	787,423,000	18,074,000	16,495,000
1873	727,374,000	47,019,000	4,829,100
1883	712,699,000	27,571,000	14,185,000
1892	577,945,000	64,422,000	35,313,000
1903	640,085,726	55,560,036	75,133,000
1905	635,682,863	47,756,246	71,633,000

The annual interest charge on the unfunded debt in 1893-94 was £486,000.

The disadvantage of a floating debt, especially in the shape of short treasury bills which have frequently to be renewed, is that in a moment of financial crisis it might be difficult to find new takers, when current bills fall due; but when it is remembered that a considerable part of the amount granted by parliament for the service of the debt is used for the repayment of capital, and that, in case of necessity the commissioners, instead of purchasing consols, may use the sinking fund for the repayment of treasury bills, this risk in view of the comparative smallness of the amount does not seem a serious one.

The expression floating debt is also used in the case of large mercantile and industrial undertakings, more especially in the case of railways, to distinguish trade debts and debts borrowed from banks for temporary purposes from debts incurred by the issue of DEBENTURES (*q.v.*) or DEBENTURE STOCK (*q.v.*). The priorities as between the debenture-holders and the other creditors depend on the special circumstances of each case and the law of the country in which the debtor's undertaking is situate.

[As to the theoretical aspects of the subject of floating debt in state finance, see Roscher, *Finanzwissenschaft*, § 143.] E. S.

FLOATING POLICY (Marine Insurance). A floating policy is a policy which designates the subject matter insured in general terms, and leaves the name of the ship, the particular subject matter, and the value of it to be defined by subsequent declarations. The declarations may be made by indorsement on the policy or in other customary manner, but the general rule is that they must be made in order of shipment and with reasonable diligence. When a declaration of value is not made until after notice of loss, the policy must be treated as an open, and not as valued policy, as regards the subject matter of that declaration.

[See Arnould's *Marine Insurance*, ed. 6, p. 337.] M. D. C.

FLOREZ ESTRADA, ALVARO (1765-1853), entered early the financial administration of Spain, and was appointed in 1798 *procurador general de las Asturias*. As such he contributed powerfully to the organisation of the resistance to Napoleon, and was promoted, in 1813, *asistente* in Seville: his jurisdiction extended over the whole of Andaluzia. During the troubled reign of Ferdinand VII. he was twice obliged to take shelter in England, where he devoted himself to the study of political economy. After the establishment of the constitutional monarchy during the minority of Queen Isabella, he returned to Spain and was appointed a member of the senate, over which he presided. In 1851 he was elected a corresponding member of the French *Académie des Sciences morales et politiques*.

Florez Estrada is considered the most distinguished Spanish economist of the first half of this century. He published in 1814, in Madrid, his *Examen imparcial de las disensiones de America*, in which he advocated the emancipation of the Spanish colonies of the New World. Later on, he wrote a pamphlet entitled *Efectos producidos en Europa por la Baja en el producto de las minas de plata* (London, 1824), on the effects of the reduced production of the silver mines and his *Examen de la Crisis Comercial de la Inglatierra*, translated into French under the title: *Réflexions sur la Détresse Commerciale de la Grande Bretagne* (Paris, 1826). But his principal work is his treatise of political economy, of which different editions were issued in London (1828), Paris (1831), and Madrid (1841 and 1848), sometimes under the title of *Tratado* and sometimes of *Curso de Economía Política*. A French translation under the appropriate heading of *Cours Éclectique d'Économie Politique* appeared in Paris and London in 1833 (3 vols. 8vo). In fact, Florez Estrada was not, and expressly disclaims being, an original writer, whilst he candidly confesses his obligations to Ricardo, M'Culloch, and James Mill. But he is by no means their undiscriminating follower, and, for instance, freely criticises some of their views on the advantages of a paper currency. He insists on the necessity of what is now called a high standard of life for the working classes; "nations cannot prosper if the working classes are not active, intelligent, and industrious; this is impossible if their wages are not

high enough to secure them a comfortable and agreeable life" (p. 375, edit. 1831). The most original part is to be found in the chapters concerning taxation. They are written from the point of view of an experienced and enlightened Spanish official, who ascribes the decay of his country to its defective financial and economic government and to the undue and excessive imposition of taxes on consumption. He energetically rejects the policy of meeting current expenses by public loans, and recommends the introduction into Spain of a moderate land-tax, leaving untouched the profits derived from investments in the improvement of land.

E. Ca.

FLORIDA-BLANCA, José Moñino, Count of (1728-1808), appointed in 1766 *fiscal* and in the following year member of the council of Castile, was sent on a mission to Rome to obtain from the Pope the suppression of the order of the Jesuits. As a reward for his success Charles III. of Spain gave him, in 1773, the title of count of Florida-Blanca and appointed him, in 1776, minister of state and later on of grace and justice. After his disgrace under Charles IV. in 1792, he retired to a convent in Murcia, his native place, where he remained until the rising against Napoleon, when his popularity caused him to be put at the head of the national government as president of the supreme governing *junta*. He died shortly afterwards.

Before his elevation to the ministry he had already made known his reforming tendencies on the question of the supply of corn for Madrid, and by his protest against the privileges of the Mesta (*q.v.*) or right of passage allowed to herds of cattle (*Respuesta fiscal . . . contra los ganaderos trashumantes*, 1770).

As a minister, he distinguished himself by his unification of the Spanish import tariff, which was different in the different kingdoms of the monarchy, and by raising the revenue derived from customs from 60 to 130 millions of reales (£600,000 to £1,300,000), although he had lowered the taxes on raw materials and machinery. He also reduced the *alcavala* or tax on every sale from 14 to about 6 per cent, and remitted it on all sales of goods by the manufacturer himself (see Alcavala). He built about 600 miles of new roads, improved the sea-ports, and gave an active impulse to irrigation. At the same time he took stringent measures for the repression of beggary and vagrancy by the establishment of the *fondo pio beneficial* or poor fund for the endowment of hospitals and orphanages, to be supplied by a fixed charge on all ecclesiastical benefices.

In the *Memorial* presented in 1788 to Charles III., Florida-Blanca sets forth the result of his endeavours and his views for the future. Some of the latter are rather striking; he intends to put down the excess of entails by submitting henceforth their creation to the royal approbation, and by authorising the municipal *junta* to sell for building purposes any unoccupied land in the neighbourhood of towns. On the other hand he is willing to declare the life owner of an entailed estate full owner of the value of all the improvements he has effected in the way of irrigating, planting, or clearing unbroken fields.

The *Memorial* has been published, with most other works of Florida-Blanca, in Rivadeneyra's *Biblioteca de Autores Españoles*, vol. 59 (Madrid, 1867), and has been given in French in Muriel's translation of Coxe's work on Spain under the house of Bourbon (*L'Espagne sous les rois de la maison de Bourbon*, vol. vi. p. 257.)

E. Ca.

FLORIN.

Florin, History of the English Gold, p. 92; Florin, English (Gold and Silver), p. 92; Florin, Austrian, p. 93; Florin, Dutch, p. 93.

Florin, History of the English Gold. A gold coin of the reign of Edward III., so called from a Florentine coin, the *fiorino*, first issued in 1252, which derived its name from the fact of its having upon it a lily (*fiore*, flower). The English coin was sometimes called a florence; it was, however, equal in weight to two of the Italian coins. The issue of florins authorised by parliament of 1343 and made current by proclamation dated 27th January (o.s.) of the same year, was the second attempt since the 9th century to introduce a gold coinage into England, the first attempt, Henry III.'s gold pennies, having failed. The florins were to be current at 6s., to weigh 108 grains, to be of the same fineness as the Florentine coin, 23 carats, 3½ grains of gold to ¼ grain of alloy, and to be made and current equally in England and in Flanders, for the facilitation of trade. Half and quarter florins were issued at the same time. In 1344, however, it having been found that they had been overvalued in proportion to silver, the florins were, according to Kenyon, made "no longer current without the consent of the receiver, but they were to be considered as bullion and taken according to their value as such," and a coinage of the Noble took their place. Thus they were not called in but demonetised, and left to take their place as bullion. Only two specimens of the English florin, two of the half, and three of the quarter florin are extant.

[Kenyon, *Gold Coins of England*, 1884.]

E. G. P.

Florin (English), *Gold.* A coin struck in the reign of Edward III. and issued at the rate of 6s. sterling. There was only one coinage of these pieces, the exact date of which is uncertain, but it was either in 1343 or 1344. Weight, 115·25 grains; fineness, 994·8. Value in gold (916·6 fine at £3 : 17 : 10½ an ounce), £1 : 0 : 3.

Silver. Token coin of the nominal value of 2s., and legal tender to the amount of £2. First struck in the year 1849; weight, 174·54

grains; fineness, 925. Value in silver francs (900 fine), 2·32 francs.

[Henfrey's *English Coins*, 1885.—Ruding's *Annals of the Coinage.*] F. E. A.

FLORIN (AUSTRIAN), OR GULDEN. Silver standard coin, 900 fine, weighing 190·53 grains. Also double florins of proportionate weight and same fineness. Value of the florin in silver (925 fine at 5s. 6d. an ounce), 2s. 1½d.; in silver francs (900 fine), 2·47 francs.

Austrian florins were last coined in 1892. On the 2nd of August of that year, a law was passed establishing a gold standard and a new metallic currency, with a gold crown, of the weight of ·3387 grammes of gold nine-tenths fine, as the unit of value. The crown is divided into 100 hellers.

The coins of the new "crown system," which were first struck in 1893, are as follows:—

STANDARD COINS.

	Grammes.	Fine.	Sterling value (gold 916·6 fine, at £3:17:10½ an oz.).
Gold—Twenty crowns	6·775	900	16/8
Ten crowns .	3·387	900	8/4

SUBSIDIARY COINS.

	Grammes.	Fine.	Nominal value in sterling.
Silver—Crowns . .	5·000	835	10d.
Nickel—Twenty hellers	4·000	..	2d.
Ten hellers .	3·000	..	1d.
Bronze—Two hellers .	3·333	..	0·2
Hellers . .	1·666	..	0·1

It will be seen that the smallest standard coin is the ten-crown piece; the silver, nickel, and bronze pieces being merely tokens. The crown is equal in value to half of the florin of the former currency. F. E. A.

FLORIN (DUTCH), OR GULDEN. Silver standard coin, 945 fine, weighing 154·32 grains, and divided into 100 cents. The 50 cent piece is 945 fine and proportionate in weight. The 25, 10, and 5 cent pieces, 640 fine, are tokens only. Value of the florin in silver (925 fine at 5s. 6d. an ounce), 1s. 7·82d.; in francs (900 fine), 2·1 francs. F. E. A.

FLOTSAM AND JETSAM. These legal terms may be defined as follows—*flotsam* comprehends all floating articles which once formed part of a wreck or of her cargo; *jetsam* comprehends all things cast overboard (Fr. *jetter*) in a storm or shipwreck. Under the common law the crown became proprietor of all flotsam and jetsam. But the right to flotsam and jetsam was frequently conferred by the crown upon the owners of manors abutting on the sea. The right whether of the crown or of the lord of the manor is now limited by the right of the original owner to reclaim his property within a year. (See Stephen's *Commentaries*, vol. ii. pp. 552-555.) F. C. M.

FLOW OF CAPITAL. It may be said that of the three agents of production known to classical economics capital is the one pre-eminently distinguished by mobility. Land is immovable, labour is movable, but frequently with difficulty and under disadvantages; nor does it necessarily tend to become more easily transferred, in spite of the increasing knowledge of the labourers and the spread of means of conveyance, because these elements are to a large extent counterbalanced by the highly-specialised character which modern labour tends to assume. Capital, however, since the early hunter of the text-books took to canoe-building, has become continuously more movable, and is now extremely sensitive to the exigencies of supply and demand; so that, notwithstanding the enormous quantity of capital invested in such a way as to preclude the possibility of immediate conversion, the flow of capital is far more continuous, whether between different trades, districts, or countries, than formerly. The flow of capital may be examined under three phases: (1) international, (2) local, and (3) industrial. The first of these terms designates the migration of capital from one country to another; the second the same migration from one district to another within the same country; and the third the transference of capital from one trade or industry to another. All these movements are greatly facilitated by a well-organised system of banking.

1. *International.*—As capital, like labour, finds its most natural employment at home, it is only where there is capital relatively to spare in a country that any appreciable portion of it goes abroad. Moreover, as it is only free capital that can be sent out of the country, the flow of capital from one country to another is determined chiefly by the amount of capital of this sort. When free capital exists in any great quantity, as it does in England, it competes against itself so as to lower the rate of interest at home; and the low rate of interest encourages the owners of such capital to attempt to gain a higher rate by investing where capital is more scarce.

2. *Local.*—The movements of capital within a country differ chiefly from the international movements in this that the rate of interest plays no part in them, as it may be assumed that it is the same throughout the whole country. Probably the most important attraction to capital that we find in a country such as England is the discovery of fields of minerals hitherto unwrought. It would be difficult to trace the gradual changes in the locality which capital seems to favour; the establishment of an industry, once fairly begun, almost always has the effect of drawing other industries related to and depending upon it, into

the immediate neighbourhood. Railways are great factors in the local flow of capital. A railway established between two large centres of industry must necessarily pass through the intervening country, and it encourages men to set up factories or other industrial undertakings near it, which in time attract capital. Lancashire and the West Riding of Yorkshire, and, in a minor degree, Lanarkshire, have come to possess the enormous amount of fixed capital they can lay claim to from such causes as these. On the other hand foreign tariffs may cause a flow of capital in the home country, though this is more properly industrial than local. Protracted struggles between employers and labourers are also credited with a certain quantity of force in driving capital from the locality in which they occur.

3. *Industrial.* — This is the form of the movement of capital which causes the greatest disorganisation of labour, and the most acute hardship, though it is, according to some, most generally beneficial in the end. The introduction of machinery and the comparative depletion of the rural districts are phenomena traceable to it, as they involve the conversion of floating capital into fixed.

Foreign tariffs and inventions assist the natural forces of supply and demand to promote the flow of capital from one trade to another. Capital will flow readily into those channels where for the time being the price gives an extra profit because of great demand; but where the transference is necessitated by over-production of some commodity, there cannot fail to be a temporary loss, and a permanent loss to the individual capitalist. The withdrawal of agricultural capital in England during the last three decades must have involved those whose capital was formerly invested in land in very serious loss; and similarly the transference of capital from the sugar industry to others cannot be effected without severe loss, and is not due to the large profits to be made elsewhere, but to the diminution of profits in the refining trade, owing to foreign bounties.

[Walker's *Political Economy*, pt. ii. ch. iii.—*Wealth of Nations*, bk. ii. ch. i.—Mill's *Principles of Political Economy;* and *Unsettled Questions in Political Economy*, Essays 3 and 5.—Cairnes's *Leading Principles.*—Marshall's *Principles of Economics.*—Marx's *Capital.*] M. G. D.

F. O. B. An abbreviation for *free on board.* Goods shipped from one country to another are generally sold either *f. o. b.*,—in which case the purchaser must pay freight and insurance; *c. and f.*,—cost and freight, in which case the vendor has to pay the freight; or *c. i. f.*,—cost, insurance, freight, in which case the vendor has to pay both insurance and freight. E. S.

FŒNUS NAUTICUM. The requirements of maritime commerce induced the Romans to adopt from Greece a peculiar kind of contract of loan. This originally consisted in borrowing a sum of money to be taken by sea to a particular place for the purpose of buying merchandise there, the condition on which the contract depended being that, if the money was lost on the voyage by accidental perils of the sea, the borrower should not be bound to repay the lender. Money lent on such terms is called *trajecticia pecunia*, because of its being carried over the sea (*quia trans mare vehitur*). Subsequently the contract was extended, so that *trajecticia pecunia* included money lent to buy goods for export to a port agreed on, the repayment of the loan depending on the safe arrival of the goods there. Such goods were frequently pledged to the lender as security for the debt, but this was not necessary. Loans made for the purpose of repairing a ship, or for paying the crew their wages, were also brought under the same rule, the condition of repayment being the safe arrival of the ship at the port of destination. As in this contract the risk of accidental loss was on the lender, not on the borrower, as in ordinary cases, he was allowed to charge more than the ordinary legal rate of interest on money loans. The maximum rate of interest on account of *trajecticia pecunia* was fixed by Justinian at 12 per cent. The technical term for interest on such a loan is *fœnus nauticum* (see Bottomry). It was treated as innocent even by the Canon Law. E. A. W.

FOLKES, Martin (died 1754), wrote *Tables of English Gold and Silver Coins, with their Weights, Intrinsic Values*, etc., London, 1745.

"A new and much improved edition of these valuable tables, illustrated with numerous plates of coins, edited by Dr. Andrew Gifford, was published in London, 1763." M'Culloch's *Lit. Pol. Ec.*

FOLKLAND was the surplus land which was not distributed to the free or dependent village communities when the English tribes conquered and settled in Britain. It must be carefully distinguished from the common lands which belonged to a community, but were not distributed among individuals (see Alod). The folkland was regarded as the property of the tribe, and after the union of the tribes to the nation, it could be alienated to individuals by *boc* or charter granted by the king and his witan (see Bocland). It could also be let out to individuals on payment of a rent usually in kind, and these rents were collected by the sheriffs and formed part of the royal revenue. The above view has been held by all the chief authorities on the early constitutional history of England. But Prof. Vinogradoff, in an article in the *English Historical Review* for January 1893, has argued, with great force, that folkland does not mean the land of the folk, but land held by folkright, *i.e.* that it is the same as what the older authorities call alod or ethel (see Feormfultum).

[Stubbs's *Constitutional History*, i.—Kemble, *Saxons in England.*] R. L.

FONFRÈDE, Henri (1788-1840), the son of a well-known Girondist member of the convention, was one of the most active journalistic writers of France during the first half of this century. His articles and essays, scattered in five or six different Bordeaux and Paris newspapers, were collected after his death and published in ten volumes (*Œuvres de Henri Fonfrède*, Paris and Bordeaux, 1844-48). The volumes seven and eight, entitled *Questions d'Économie Publique*, contain his economic writings, and one of them, *Le Système Prohibitif*, a luminous and incisive plea in favour of free trade, was republished as a pamphlet in 1846 by the *Association pour la Liberté des Échanges.* Fonfrède, very independent in his views, remained throughout his life a steady opponent of the conversion of public debts ("there is no more reason for a *maximum* price of 100 francs for public stock than for the same *maximum* price for coffee"—vi. p. 227), of sinking funds ("is it not mere folly to pay off in order to borrow, and to borrow in order to pay off?" *Système Prohib.*, p. 61), of Algerian colonisation, of commercial and administrative centralisation in Paris, and of government measures proposed to facilitate the raising of money on landed securities ("Every attempt to render land more fluid is an intense political and economic mistake. Land must be made easy to divide, not easy to mobilise."—vii. p. 231). E. Ca.

FONTANELLI, Carlo (died 1886, at Florence), was professor of political economy at the Scuola di Scienze Sociali in Florence. Author of—

Manuale popolare di Economia sociale, Firenze, 1870, 2nd ed. 1881; *Gli scioperi*, Napoli, 1874-75. A. B.

FONTEYRAUD, Alcide (1822-1849), born in the island of Mauritius, died at Paris. He became at a very early age a teacher in the higher commercial school under Blanqui, whose pupil he had been. Political economy soon absorbed him, and after March 1845 he was placed on the staff of the *Journal des économistes.* In January 1846, the *Revue britannique* published an article by him entitled "La ligue anglaise" (Anti-corn law league), which brought him into the notice he so well deserved. After this Messrs. Guillaumin entrusted him with annotating and preparing for publication the works of David Ricardo (vol. xiii. *Collection des Principaux Économistes*), which appeared in 1847. Fonteyraud was enabled, through his perfect knowledge of the English language, to translate the works of that economist, which up to that time had never appeared in French, and also to revise the translation made by Constancio. Fonteyraud wrote at the commencement of this volume, which is occupied entirely with the works of Ricardo and notes made on them by J. B. Say and others, a brilliant and interesting notice of the great English economist, who up to that time had been but little understood on the continent. He also translated the *Definitions in Political Economy* by Malthus. He finally wrote for the collection *Encyclopédie des connaissances utiles, Principes d'économie politique* (8vo, 1849). L. Wolowski had no hesitation in endorsing the opinions expressed in this volume. Fonteyraud was removed by cholera at the age of twenty-seven years from the study of that science to which, had it not been for his premature death, he would doubtless have rendered signal services. His principal works were collected by Joseph Garnier and published with a notice from the pen of that writer, under the title of *Mélanges d'économie politique*, 1 vol. 8vo, 1853. A. C. f.

FOOD-RENTS existed in Anglo-Saxon and earlier manorial times side by side with rents in labour and in money. They were included under the general name of *gafol*, tribute, which comprised other payments of produce besides actual food; and they were payable by freemen as well as serfs, in contradistinction to the labour services known as week-work which were usually a mark of villein status. The food-rents paid to the lord of the manor may be connected in origin with the Feorm-fultum and the later Purveyance (*q.v.*), payable for the use of the king and his court; they may perhaps be considered as taxes or exactions rather than as economic rents. Owing to the frequent absence of the lord these rents would be commuted for money earlier than labour rents, which could be paid just as conveniently in the lord's absence as during his residence on the manor; and it is pretty certain that the free tenants who paid rents in kind did become money-paying tenants earlier than the serfs who owed week-work as well as produce. The commutation was general by the 14th century, but the dates of the stages of the process cannot be exactly given as payments in kind are found mixed, apparently without system, with original and commuted money payments in most statements of manorial services and rent drawn up before that time. The commonest articles of food paid by the tenants were poultry and eggs, but oats, barley, malt, ale, sheep, pigs, meat, loaves, honey, occur often; evidently the manorial household expected to be provisioned by the tenants, and it was not uncommon for a definite part of the estate, the lands, for instance, of a monastic house, to undertake such provisioning for a week, a fortnight, or some other fixed time. The growing need for money helped to put an end to such rents as well as to labour dues.

[Seebohm, *English Village Community*, 1883.—Vinogradoff, *Villainage in England*, 1892.] E. G. P.

FOOD, Taxes on. These were common in

the 18th century, in the form of duties on flour, bread, and meat (*Wealth of Nations*, bk. v. ch. ii. pt. ii. art. iv.). They have now disappeared as general internal taxes, the last instance being the Italian Grist Tax (see MACINATO). They still exist as CUSTOMS DUTIES (see also CORN LAWS), and also make a part of local taxation in France and Italy (see OCTROI; SALT DUTIES). In theory they may be treated as one division of taxes on necessaries. The general discussion of their effect belongs to TAXATION (*q.v.*). C. F. B.

FORBONNAIS, FRANÇOIS VÉRON DE (1722-1800), born at Mans, died at Paris. Though he never occupied any official position or received any appointment equal to his merits, Forbonnais exercised a great influence over his contemporaries. He came of a respectable business family, and began life in retail trade; he then travelled for five years, and afterwards improved his knowledge of affairs by studying the workings of business on a large scale at Nantes for the same period of time. By 1752 he considered his economic education sufficiently advanced to justify him in preparing a memorial on the position of public affairs which he then presented to the controller-general of Finance, an office filled at that time by J. B. de Machault, a financier of high ability. Through an unfortunate accident his memorial was not read, and its author became discouraged. Forbonnais then resolved to address himself directly to the public, and he printed a great number of works of which we can only mention the most important. These are *Considérations sur les finances d'Espagne*, 1753, 1 vol. 12mo; *Éléments du commerce*, 1754 and 1796, 2 vols. 12mo; *Recherches et considérations sur les finances de France depuis 1595 jusqu'en 1721*; Bâle, 2 vols. 4to, and Liège, 6 vols. 12mo, 1750; *Principes et observations économiques*, 1767, 2 vols. 12mo (reproduced in Guillaumin's collection of the principal economists); and finally *Observations succinctes sur l'émission de deux milliards d'assignats* 1790, 1 vol. in 12mo. Forbonnais was never able to free himself from the errors of the mercantile system, and shows himself favourable to the theory of the balance of trade. Besides this he was a protectionist, although he considered that the rate of duty, beyond which no branch of industry had any rights to existence at the cost of the consumer, should be limited to 15 per cent. How many ministers in our own days would be excused by the supporters of free trade if they would only restrict their demands to this scale! Forbonnais, however, showed himself in other respects so sound an economist and financier, and so distinctly opposed to all crotchets, that he has left behind him a well-deserved reputation. His works are read and quoted even at the present day. He was consulted by all the influential politicians, and by all the great administrators of his time. Silhouette placed him at the head of his office in 1759; Forbonnais had at that time filled the office of inspector-general of the mint for three years. Causes which were entirely honourable to himself led to disagreements between him and Madame de Pompadour, and he was sent to reside in exile on his estates. One of his unquestioned merits consists in having endeavoured to apportion the incidence of public taxation equally among all classes. Forbonnais did not solicit office in 1789, contenting himself with writing many detached papers, still in manuscript, on economic subjects. He controverted the doctrines of the physiocrats, but, it must be admitted, without seriously impugning their arguments. Forbonnais was admitted to the Institute in 1794 and died six years after, leaving behind him the reputation of a man conscientious and sincere, whose judgment was of the highest delicacy, who was an indefatigable worker of a frank and vigorous temperament. A. C. f.

FORCED CURRENCY usually implies two attributes: it must be received as legal tender; it need not be cashed on presentation. As Prof. Walker points out, the character of force may exist even in the absence of the first attribute,—for instance, money "may not be made legal tender, but all remedy at law may be taken away from creditors who refuse to receive it." It is argued that the silver currency of India is in this position at the present time (1894).

For other incidents, and for examples of forced currency, see INCONVERTIBLE CURRENCY. F. Y. E.

FORCED LABOUR, COMMON CHARACTERISTICS OF. In the articles on CONSCRIPTION; CORVÉE; ENFRANCHISEMENT; IMPRESSMENT; MANOR; SERF; SLAVERY, will be found details relating to the principal ways in which forced labour has come into prominence at various stages in the history of society. Here it is proposed only to deal with the common characteristics of these systems of labour. One classification may divide the subject into two branches. Forced labour may be either an industrial phenomenon or a financial one. Slavery and the kindred institution of serfdom arise in the relations between individuals; corvée and conscription, and all other methods by which the state exacts unpaid labour from the citizen, are, apart from political considerations, rather in the nature of financial expedients. Similar economic disadvantages are found in both these classes, although the second is to some extent free from the moral stigma attached to the first class. An important disadvantage is that the labour is more inefficient than paid labour, and less susceptible of control and organisation. The labourer naturally treats the doing of the

work, and not the efficiency of it, as the main thing that concerns him, and any relaxation in the method of compulsion employed may result in the labourer's abandoning his task altogether. The *Report of the Poor Law Commissioners of* 1834, ch. iv., shows how difficult it was found to compel the paupers to work on the roads by way of task work. Many authorities have insisted upon the greater cost of slave labour as compared with free, and the necessity of supervision and management entailed by its use. Even in the case of the forced labour exacted from jurymen, the quality of the work is found to be inferior, in spite of the fact that an effort is made to impress the juror with a sense not only of the responsibility but also of the dignity of his position. Where, however, a moderate degree of labour is demanded for purposes of obvious public advantage from fairly enlightened citizens the system may succeed. In the early history of the Canadian colonies the statute labour exacted for the repair and construction of roads was willingly contributed, and men were even found ready to work beyond the time demanded of them. It need scarcely be pointed out that these conditions are not likely to be often discovered in any ordinary industrial system based upon forced labour.

Forced labour has been employed in many countries for penal purposes; and in England it is frequently used in the administration of the poor law as a test of real destitution. Secondary effects have been supposed to be produced in this way on the labour market, and it has been alleged that the wages of unskilled labour have been depressed by the competition of prisons in the same trade; for the questions arising hence see PRISON LABOUR; WORKHOUSES. C. G. C.

FORCED LABOUR, instances of. Egypt affords in the Great Pyramid the earliest example of the employment of such labour. According to Herodotus (bk. ii. ch. 124), Cheops "closed the temples, and forbade the Egyptians to offer sacrifice, compelling them instead to labour, one and all, in his service . . . 100,000 men laboured constantly, and were relieved every three months by a fresh lot. It took ten years' oppression of the people to make the causeway for the conveyance of the stones. . . . The Pyramid itself was twenty years in building." But if we accept the conjecture of Mr. W. M. Flinders Petrie (*The Pyramids and Temples of Gizeh*, 1885), that the work of transport of the stones had only to be performed each year during the three months of inundation, when the land was under water and the inhabitants were necessarily almost idle, the hardship of thus requisitioning the labour of the people in a great measure disappears.

Coming to modern times, we find in the CORVÉE (*q.v.*) the general application of forced labour to the construction and maintenance of roads. In England, statute labour, as it was called, finally disappeared in 1835, but in France the *corvée*, in its modified form of PRESTATION (*q.v.*), still exists as an effective working system. The municipal council having, in exercise of the law of 21st May 1836, voted three days' *prestation*, every inhabitant of the commune between the ages of eighteen and sixty who has elected to work in lieu of making a money payment, is called on to attend at a convenient period fixed by the prefect. The work, usually breaking and carrying stone, may be performed by the day or piece, the latter method being favoured by the authorities as giving more satisfactory results. The money payment, which may be substituted for *prestation en nature*, is fixed annually by the departmental assemblies, and is always below the real value of a day's work. But the peasants for the most part prefer to give their labour rather than their money, 65 per cent of the total value (57,000,000 frs.—say £2,280,000) of the three days' *prestation* in 1888 being acquitted *en nature*. The proportion thus acquitted has, however, steadily decreased from 81 per cent, the average for the decade 1837-46. It is estimated that one-tenth of the cost of the work is saved by the system of *prestation* as compared with the employment of contractors. The system is often attacked as a survival of the hated *corvée*, but in 1888 sixty-seven of the departmental assemblies were in favour of its maintenance (Say et Chailley, *Nouveau Dictionnaire d'Économie Politique*, 1891).

If we except the system of *prestation* now existing in France, we must turn to Egypt for the last as well as the first chapter in the history of forced labour. From the earliest time it is probable that the irrigation canals were made and kept in repair by the forced unpaid labour of the Egyptian people. Theoretically speaking, there was no great objection to this, for the very life of the country has always depended on the maintenance of the means of irrigation. Until the nineteenth century only one crop a year was yielded, sown as the Nile water receded in November, and requiring little attention till reaped in April. The agricultural labourer had little to do at other seasons, and could not be better employed than in clearing out the canals leading to his fields and repairing the Nile embankments which defended him from inundation. Therefore, though it cannot be supposed that the burden of the *corvée* was fairly apportioned, or that the rich took their just share with the poor, the evil was not a very crying one. But the introduction of cotton and sugar-cane cultivation caused an important change. These crops require to be moderately watered all round the year, and for their culture a system of summer canals had to be dug, so deep as to take in

water at the lowest Nile. These canals were yearly choked with the mud deposit of the Nile flood, and for miles of their course had to be cleared, the depth of silt being as great as from 6 to 10 feet. For this purpose, the *corvée* was annually called out, and as the Khedive and other large proprietors generally evaded their liability to furnish men, the burden of the work, which was far heavier than any previously required, fell on the poor, and this at a period of the year when their time had become valuable to themselves. Thousands of persons were forced to work for five or six months in the year, without pay or any provision of food, without proper tools, often far away from their homes, and on canals from which they could themselves derive no advantage. In the years 1878, 1879, and 1880, it is estimated that 188,000 men were summoned to the works. In 1883, the *corvée* was equivalent to an army of 202,650 men working for 100 days. This was the last year of the old *régime*, for in 1884 the irrigation service was placed in the hands of English engineers. Partly owing to improved methods of regulating the Nile waters, whereby the quantity of silt was diminished, and partly to the expenditure of £73,461 in payment for work done by contract, the *corvée* in 1884 was reduced to the equivalent of 165,000 men for 100 days, and in 1885, with an outlay of £116,535, a further reduction to 125,936 men was effected. Part of this last-mentioned sum was provided under a scheme, whereby the *corvéables* in certain districts were allowed to redeem themselves by a money payment. An immense increase in the cotton cultivated in these villages followed.

The evils of the *corvée* system, and the great economic advantages that would ensue from its abolition, were so strongly recognised by the new Ministry of Public Works that in 1885 they proposed that a sum of £250,000 net, which had been decreed for the reduction of the land tax, should be applied instead in abolishing the *corvée* as far as possible, such an application being considered as really the best method of relieving the burdens on land. It was estimated that the whole work of clearing the canals would cost, by contract, about £400,000 a year, so that a moderate *corvée* would still be necessary after expending the available sum. The proposal was adopted; the numbers employed were reduced to 95,093 in 1886, 87,120 in 1887, and 58,788 in 1888. The beneficial effects of the change were so apparent that the total abolition of the *corvée* was at once generally demanded. A further sum of £150,000 was required, and in December 1889 the National Assembly, although composed almost entirely of landlords, without a dissentient voice passed a measure imposing a special tax on land to raise that amount. The new tax was, as a matter of fact, never levied, the needful fund being eventually provided ou of savings from conversion of debt.

In 1890 the *corvée* in Egypt, as a regula system of forced labour for the execution c public works, thus ceased to exist. A larg but gradually diminishing annual levy of men it is true, is still made to guard and, in th event of a breach, to repair the Nile bank during the season of flood; but every fella feels a direct interest in this duty, and th obligation to perform it is not a hardship a all comparable to the tremendous labour c clearing the canals, to say nothing of the hundre and one illegitimate objects for which th *corvée*, now suppressed, was formerly employe (Milner's *England in Egypt*.—Blue Book, Egypt No. 1, 1902).

The Suez Canal having been projected at time when the *corvée* was in full operation i Egypt, it is not surprising that forced labou should have been largely employed in its con struction. By a contract entered into witl M. de Lesseps in July 1856, the Viceroy Mohammed-Saïd Pasha, engaged that workme should be supplied by the Egyptian govern ment, on the demand of the chief engineers o the canal, at wages to be fixed according to th average rate paid in the country by privat individuals. The wages actually paid being however, far below the market value of th work, the arrangement was very economical a far as the company was concerned, and betwee 20,000 and 30,000 men (at one time 80,000 were pressed into the service. This compulsor employment of the natives gave rise to remon strances in the English House of Commons based on humanitarian grounds, and partly o this account and partly because the men wer withdrawn from cultivating his own lands the successor to Saïd Pasha, Ismaïl, was anxiou to retire from the obligation of finding force labour for the company. Consequently, b diplomatic note of 6th April 1863, the Porte "seeing in the stipulations for the providin of workmen a contravention of the laws unde which the Ottoman Empire is governed," de clared its opposition to the continuance of th works. This determination was a great blo to the company, which now had to engag European labour as well as the voluntar services of the natives. The result was t more than treble the cost of excavation. A compensation for the loss entailed by the with drawal of the forced labour, the Egyptia government, on the award of the Emperor c the French acting as arbitrator, paid the com pany 38,000,000 frs. (say £1,520,000). I may be added that the note of the Porte did no prevent the Viceroy from continuing the long established custom of employing forced labou without pay in the cultivation of the vic regal lands, and that the gross abuses arisin under this system only came to an end whe

under the British occupation, the lands themselves passed from the control of the Viceroy (Percy Fitzgerald, *The Great Canal at Suez*, 1876).

The history of forced labour in Egypt illustrates in a striking manner the theoretical justification of the system, its economical advantages when legitimately used, and the economic loss arising from its abuse. It is capable of defence on the same grounds as compulsory military service, when used for purposes with which the vital interests of the nation are bound up. Where money is scarce, it may be less burdensome than taxation to effect the same objects, and certainly is so where the labourers subject to it would otherwise be idle. But the system becomes oppressive and economically wasteful when the burden falls on a busy population, and the service entails the removal of the labourer, especially for a lengthened period, from his own proper work. Generally speaking, a man's labour in his own fields and at his own direction is economically more valuable than the same labour applied to objects in which his interest is less direct and in which he is under official control. There is no doubt that where forced labour, even for indispensable public works, involves a considerable interruption of the natural course of industry, it is in the long run more costly than taxation to ensure the same purposes [see CORVÉE; PRESTATION]. F. A.

FORD, SIR EDWARD (1605-1670), proposed the issue of exchequer bills in *Experimented Proposals how the King may have Money to pay and maintain his Fleets with ease to his People*, etc., London, 1666, 8vo, reprinted in the *Harleian Misc.*, 1744 (vol. iv.) and 1808 (vol. vii. 8vo, and vol. iv. 4to). He also published *A Demonstration that Farthings are as necessary as bread for most of the People; And that Farthings of an intrinsic value are useless and deceitful.* n.d. and *A design for bringing a navigable river from Rickmanswort in Hartfordshire to St. Gyles in the fields*, etc., London, 1641, 4to. Sir W. Roberts published in the same year an *Answer to Mr. Ford's book entitled a Designe*, etc. and both pamphlets were reprinted in 1720.

[Full details of Ford's life are given in the *Dictionary of National Biography.*] W. A. S. H.

FORECLOSURE. The extinguishment by the decree of a court of an equity of redemption (see EQUITY OF REDEMPTION). J. E. C. M.

FOREIGN DIVIDENDS is a term correlative to FOREIGN INVESTMENTS (*q.v.*). By a dividend something more than mere interest is implied: it may be held to cover some special risk as well as what are constructively earnings of management (cp. Professor Marshall's *Economics of Industry*, VI. vi. § 4 *seq.* on net and gross interest). Under "foreign," in this connection, we include every dividend earned by members of a community in places external to the community. We include the interest on private investments abroad as well as that on shares of public companies and government loans. In the case of England we should include dividends accruing from the colonies as well as those accruing from foreign countries. There is no country in which such dividends are so important as the United Kingdom. This fact goes a long way towards explaining our excess of imports (cp. article on COMMERCE). In 1891, when the excess of imports was £126,327,546, the amounts due to us from abroad were from £75,000,000 to £85,000,000.

A little consideration will show that all such dividends must eventually be paid by means of the importation of commodities. They are distributed by the agency of banks and financial houses, which are placed in funds by bills of exchange. The fact that importers have these bills to sell implies that they have to pay for commodities coming from abroad; or, to put it perhaps more accurately, parties abroad who have to pay interest on borrowed capital can only pay it by shipping bullion or commodities, and they use the ordinary methods of adjusting mercantile accounts. There is no real difference between the bill of exchange used for these payments and that used for settling ordinary debts between merchants. In the latter case the bills practically pass from importers to exporters or *vice versa*. In the case of dividend payments they pass from the importers to the bankers, as representative of the sources of invested capital. The actual payments are by commodities, of which bullion is only a small fraction. On an average of three years, ending with 1904, the annual importation of bullion and specie was £38,641,665, its exportation £37,220,425. It is generally asserted that the dividends receivable on the foreign investments of England may be placed at least at £75,000,000. This is sufficient to prove our point.

In a book called *The Redemption of Labour* (C. B. Phipson), vol. ii., there is an attempt to distinguish between true and spurious dividends. The reasoning is undermined with fallacies, and the conclusions cannot be accepted. However, one point of some value is suggested, viz.: that the majority of payments received from abroad are raised by taxation and not earned as dividends proper,—a distinction which hardly concerns the receiving country; although there is no doubt that the objects of British colonial loans are more and more scrutinised as each issue is made, since there is a very definite sense amongst investors that productive expenditure of the loan is a guarantee of their dividends. C. A. H.

FOREIGN EXCHANGES, see EXCHANGES, FOREIGN.

FOREIGN INVESTMENTS. In this connection we use "foreign" in its original sense as meaning outside the territorial area which, for the time being, is under discussion. Probably few countries are without some investment of capital outside their own limits. We do not include capital taken out of the country by the

settler, which is his own property; that becomes part of the capital of the community to which it is transferred. The term indicates capital belonging to persons resident in any given territory but employed by other persons outside that territory; and it includes, of course, the acknowledgments for capital which has been so employed, and forms a debt from those who enjoyed its use to the lenders. Thus the debts of foreign states, as well as the capital of companies operating abroad, and capital lent by individuals to persons at work abroad, form the sum total of foreign investments.

No country in the world has such a mass of outside investments as the United Kingdom—whether in its own dependencies, or in foreign countries usually so called. The following table gives some idea of their amount:—

Colonial Government Securities .	£225,000,000
Foreign Stocks and Bonds . .	525,000,000
Railways in British Possessions .	75,000,000
„ India . . .	65,000,000
„ America . . .	120,500,000
„ Foreign Countries .	127,500,000
Banks Operating Abroad . .	50,000,000
Foreign Breweries . . .	3,500,000
Colonial and Foreign Corporation Stocks	20,000,000
Gas Companies Operating Abroad	6,500,000
Iron Companies Operating Abroad	500,000
Land and Mortgage Companies .	100,000,000
Tea Companies	2,500,000
Telegraph Companies . .	10,000,000
Waterworks Companies Operating Abroad	3,000,000
Tramway Companies Operating Abroad	4,000,000
Mines—Colonial and Foreign .	30,000,000
Miscellaneous Companies—Colonial and Foreign	30,000,000
Bank Deposits, say . . .	50,000,000
Private Investments . . .	250,000,000
Total .	£1,698,000,000

The amounts above given, except the last item, are arrived at from the stock exchange daily list (for January 1893, and ten years have not greatly altered the facts), by estimating what proportion of each class of security is held in this country. For this purpose the best expert information was sought. The proportion varies in several cases. About seven-eighths of the colonial stocks are held in Great Britain; of some foreign stocks hardly any, but on the whole range of those quoted in London it has been thought safe to estimate three-fourths as held here; of American railways, beyond the gold bonds, in spite of occasional bouts of speculation, but a small proportion is held in England, although more than we were at first inclined to think. As a general rule, it may be stated that from two-thirds to three-fourths of the other classes of securities quoted on the London stock exchange are held in this country. Only a small proportion of bank deposits in the colonies and elsewhere is taken as belonging to this country; the greater part probably belongs to *bona fide* colonists or is not actually invested.

To private investments we have less guide. We know generally that large sums are invested in the management of estates and the conduct of businesses, and by way of mortgage and otherwise, throughout all the colonies as well as in foreign countries. We have Sir N. Lubbock's estimate of West Indian property alone, almost all of which is held in England, as over £30,000,000. Sir R. Giffen placed the foreign investments which escaped income tax in 1885 at £500,000,000. It is clear that this figure includes many public companies, but he speaks of "immense investment in private channels." It is highly probable that the amount is not less than the aggregate of banking deposits, land companies, and miscellaneous companies, and that half of Sir R. Giffen's figure, above quoted, is a very modest computation.

In his *Growth of Capital*, which we quote, Sir R. Giffen speaks of the foreign investments of Great Britain in 1885 as being £1,300,000,000, but his detailed estimate of the income of the nation derived from public sources abroad, above £85,000,000, implies a higher figure, for at fifteen years' purchase this would give nearly £1,300,000,000 for public investment alone, and twenty years' purchase is the rate he elsewhere adopts for capitalising this income. However, capitalising the £85,000,000 at fifteen years' purchase, and adding £200,000,000 for private investments, we should make the amount of foreign investments in 1885 to be over £1,475,000,000. Consequently our figure of £1,700,000,000 for 1892 may be considered moderate, showing an increase of only £225,000,000 in seven years. This figure gives the same annual rate of increase as that adopted by Sir R. Giffen in another part of his book, and we should have expected a higher proportionate rate.

Interesting statistics as to the growth of foreign indebtedness to England will be found in *Fenn on the Funds*. The editor states that between 1862 and 1872 the external borrowings of foreign states quadrupled, and that the mass of these loans was raised in London or Paris; and some index to the growth of the obligation is found in the capital amounts of foreign securities quoted in successive decades in the stock exchange, viz.:—

January 1862 . .	£143,930,000
„ 1872 . .	600,000,000
„ 1882 . .	830,000,000

Similarly, Sir R. Giffen computes that from 1865 to 1875 miscellaneous foreign investments increased fourfold, and he makes the increase in those which pay income-tax between 1875 and 1885 at least £320,000,000, explain-

ing that, in the latter decade, the actual new issues of colonial and foreign government loans, municipal loans, and railways, amounted to £361,800,000. It is hardly wise to give more than such indications of growth. To approximate to an accurate proportion of the annual increase in the past it would be necessary to have figures for many years back made up exactly on the same principle. These hardly exist, except, perhaps, in Sir R. Giffen's hands, but we may accept, as a minimum, that some £30,000,000 a year are invested abroad.

In our estimate above, of course, no notice has been taken of lost capital, which has a very large place in the history of foreign investment. We have regarded only that which has at least the potentiality of a dividend. We reckon that it is fair to compute the interest at 4½ per cent on the average. This would give an annual produce of £76,500,000, a figure which comes curiously near to the £75,000,000 assumed in the article on COMMERCE (*q.v.*) as the proportion of the excess of imports represented by the interest on capital invested abroad. (See also INVESTMENTS.)

[See Giffen's *Growth of Capital*, 1889, pp. 26, 27, 40, 41 app.—Burdett's *Official Intelligencer*, iv. p. 13.—*Investor's Monthly Manual*, etc. Cp. a note at p. 99 of *Parly. Paper* 1761 of 1903.] C. A. H.

FOREIGN LABOUR. International migration of labour on a large scale is a marked characteristic of the present day. This movement was never contemplated by the older writers on political economy. Capital and labour alike were believed to be extremely tenacious of their native soil and averse to transplantation into foreign lands. But in our time capital and labour display a wonderful mobility, and the economic situation has in some instances been gravely affected by the transfer of vast bodies of producing agents from one country to another. The figures in the Report of the Royal Commission on Alien Immigration (1903) show how large an amount of labour is now migratory in character. By reason of the proportions it has attained, various states have of late taken steps to regulate the immigrant labour-market, and in some instances have imposed on it harsh and inhospitable restraints. The evidence contained in the Report above referred to and the mass of material collected by the Committee of the House of Lords on the Sweating System (cp. Blue-Book on Sweating System, 1888-89) supply much useful information regarding the amount of immigrant labour and its effect on domestic industry. For further details see *Labour and Life of the People*, London (East), edited by Mr. Charles Booth, 1889.

It is not proposed here to investigate the number of aliens that arrive in this country, as that subject will be more fitly considered under the head of IMMIGRATION (*q.v.*).

The better class of immigrant only crosses this country on the way to other lands. Large bodies of aliens arrive every year, for example, *en route* for America. But the poorest and worst type of foreigner remains here, either permanently or for a considerable period.

The trades which these foreign workmen chiefly undertake are baking, boot and shoe making, cabinetmaking, tailoring, and also such minor industries as cigar-making, fur-cap making, and ostrich-feather cleaning. Moreover, fifty thousand aliens—including lascars and Asiatics in the Indian trade—are said to be working in vessels that fly the British flag, and to be in demand as being more sober and amenable to discipline than Englishmen (see Mr. Glover's paper before Statistical Society, March 1892, "Tonnage Statistics of the Decade 1880-1890"). And a considerable number of Germans are engaged as domestic servants. To appreciate the economic situation, it will be necessary to see in what branches of the principal industries foreign and domestic labour come into contact.

Baking.—No trustworthy statistics exist at present regarding the number either of natives or aliens employed in the provinces, but in London the master bakers are estimated at three thousand, and the operatives at ten thousand or more, one half of the masters and fully that proportion of the men being Germans. The evidence given before the Royal Commission of Labour, Group C, 12th August 1892, showed that in many cases the foreign immigrant was boarded and lodged by a fellow-countryman and taught the trade, until, by thrift and perseverance, he himself became a small master. The better class of immigrant works in bakeries where "Vienna" bread is made, earns good wages, and holds aloof from trade societies. A lower type of alien supplies foreigners and Jews in East London, and often belongs to the Amalgamated Union of Bakers and Confectioners. Few foreigners, if any, compete in the wholesale business, nor does foreign competition seem to have seriously affected wages throughout the trade.

Boot and Shoe making.—In the boot and shoe trade of East London 25 per cent of those engaged are stated to be foreigners, and in number over ten thousand persons. No statistics are available as to the proportion of aliens now at work in other parts of the kingdom.

In the machine-sewn trade, the greater portion of what is known as "finishing" is in the metropolis monopolised by foreign workmen. For details see Mr. Booth's book above cited, pp. 274 *seq.* Mr. David F. Schloss, an authority on the subject, maintains that the unskilled labour of the "sweated" Jews in the "finishing" department leads to a considerable increase of employment on the part of a large body of well-paid and skilled English workers.

The boot clickers and closers, for example, the tanners and others employed in the leather trade, are all Englishmen in receipt of fairly good wages and subject to reasonable hours of work.

In the class of goods known as "sew-rounds," *i.e.* fancy shoes and slippers, the better class of work is almost entirely in English hands, but the inferior work is made chiefly by Jewish work-people. Speaking generally it is alleged that, within the last ten or fifteen years, foreign Jews have gradually secured the commoner class of work in which native workmen generally learnt their trade. Further allegations are made in statements quoted in official publications and elsewhere, to the effect that we are being injured in our foreign markets by the stuff produced by this cheap labour, a great portion of it being made of cardboard and composition. The statistics of the exports of boots and shoes from this country do not, however, bear out this contention.

Cabinetmaking.—It is said that of 23,000 persons employed in this trade in London 4000 are foreigners. Here there can be little doubt that the pressure of foreign immigration has not yet become acute. Although the average wages earned by the alien are somewhat lower than those of domestic labour, yet he has not imported into this industry a standard of life or of work economically degrading (for details, cp. Booth, p. 360 *seq.*)

Tailoring.—The ready-made clothing trade is very largely adopted by the immigrants, and Mr. Burnett, the labour correspondent of the Board of Trade, contemplates the time when this department will be entirely in their hands (cp. his Report on Sweating System, 1887). Eighteen or twenty thousand of them are stated by this authority to be employed in the manufacture of cheap clothing or "slops" in East London. Nor is the increase of foreign employment in the tailoring trade confined to London only; it is proceeding likewise in Birmingham, Leeds, Manchester, Newcastle-on-Tyne, and Glasgow. The majority of these aliens are Russian, German, or Polish Jews, working, for the most part, under a Jewish contractor. Conflicting views prevail as to the extent to which this trade has been invaded by foreigners, and, in the absence of any recent census returns, all statements on this head must be received with caution. There is also a conflict of opinion whether the immigrants engaged in the cheap clothing business compete with English labour or not, some competent observers alleging that they chiefly compete with one another, and that if they compete at all with native workers it is in a trade which they themselves have created. The best opinion seems to be that, as regards the supply of ready-made clothing to wholesale houses, the actual competition lies between the staff of the Jewish contractor and domestic female labour employed in provincial factories. These factories, however, make little headway against the particular industry of "coat-making," a department of wholesale business which the Jewish operative practically monopolises. In this branch we find no contractors on a large scale, but a multitude of small masters who avail themselves of the necessities of the immigrant "greener"—as the alien is termed on his first arrival—to secure from him a day's work of indefinite duration at merely nominal wages. The social surroundings of these operatives are often deplorable, and the prices at which work is taken are constantly reduced by the fact that the alien hands have little desire or capacity for labour or trade combination, with a standard of life that admits of an enormous amount of toil under the worst possible conditions (cp. Booth's work, *supra*, p. 224 *seq.*).

We have now cleared the ground for the consideration of the attitude of economists towards foreign labour. The subject naturally falls into two branches.

a. First, the competition between native workers and foreigners, who work for a fair wage, with abilities equal and a social status not inferior to those whom they displace.

b. Next we are confronted with cheap labour supplied by aliens, who arrive in a more or less impoverished condition, and whose standard of existence is very low.

As to the class of competitors under head *a*, there can be no objection consistently raised, from an economic point of view, by those who are in favour of commercial freedom. Mr. Fawcett, in his treatise on *Free Trade and Protection*, 3rd ed., deprecates any attempt to restrict this class of worker. Where no moral disadvantage can result from the settlement amongst us of such workmen, an employer would undoubtedly be justified in making use of their services. To interfere with the importation of such labour would be opposed to all the best instincts of free trade. Can any distinction be drawn economically between the competition of labour and the competition of the products of labour? Why should freedom to buy and sell be denied to those who have labour to dispose of? Moreover, the denial of such a right would injuriously affect not only the parties immediately concerned, but also the public who purchase the industrial product.

Again the foreigner is often engaged on account of his superior qualifications, and not only because he is willing to sell his services at a cheaper rate. Thus German scientific men are secured by some of our large manufacturers, and so are German clerks, owing to their linguistic attainments; while German bakers, whose knowledge of the processes of fermentation often exceeds that of Englishmen, readily find employment in English houses. Skilled

mechanics from France and Italy have invaded some of our textile industries. So far from any valid objection lying against the importation of such workers, it is probable that they give a distinct spur and impetus to the advance of education in this country.

As an exception, however, to the general rule of non-interference, take the instance of labourers imported under contract to perform certain services in a foreign country. Here it has been argued that the native workman is injuriously affected, because the immigrant may be ignorant of the conditions prevailing in the labour market he is about to enter. Advantage may be taken of his ignorance to extort terms unfair both to him and to domestic labour. The government of the United States has passed a law to prevent contracts of this nature being enforced. Such action must not be viewed as an attempt to restrict immigration, but as an endeavour to protect the alien against the consequences of his own heedlessness, and to provide that the native worker shall not thereby suffer loss.

Passing on to head *b*, what attitude should the economist assume towards any attempt to fetter the introduction of cheap labour? The advocates of *laissez-faire* base their attitude of non-intervention on the ground that "natural liberty" conduces best to the production of wealth. The business of the employer, they say, is to buy his labour in the cheapest market. If, by engaging Russian or Polish Jews, he lowers the cost of production, he ought to have full liberty to do so. Government should interfere as little as possible with the distribution of wealth resulting from free competition, because any such interference must tend to impair aggregate production more than it could increase the utility of the produce by a better distribution (cp. Sidgwick, *Principles of Political Economy*, 2nd ed. bk. iii. ch. ii., where this view of the question is stated). Enlightened self-interest on the part of the consumer will lead him to demand the commodities that are most useful to society, while self-interest will induce the producer to turn out these commodities at the least cost.

Setting aside for the moment the question of free competition and the alleged right of the consumer to secure at all hazards the cheapest article, a less sordid argument may be advanced in favour of non-interference with existing industrial conditions. The argument, it is true, only applies to one branch of trade, but it may be regarded as a representative one. A large section of the tailoring industry has, within the last thirty years, been transformed from a retail to a wholesale business. This transformation has rendered it impossible for the English journeyman tailor, apart altogether from the question of price, to compete with the contractor for orders from wholesale houses. The organisers of Jewish labour in the metropolis are able to meet the demand of these houses—coming into competition, it is true, with provincial factories in certain directions, but, so far as the wholesale coat manufacture is concerned, supplying a want that under existing circumstances could not be otherwise satisfied, as pointed out in Mr. Booth's book, p. 235 *seq.* In connection with this aspect of the case attention should be paid to the enormous volume of export trade in ready-made clothing that has gradually been developed under the present system. The total export of the country under the head of "apparel and slops" has doubled itself within the last twenty years, and as regards the port of London, is 2½ times what it was. In 1868 the exports of these articles from the United Kingdom were £2,313,000, and from London only, £1,233,000. In 1888 the figures are: from the United Kingdom £4,658,000, from London only, £3,091,000. Now it may be taken for granted that, in default of her supply of cheap foreign labour, England, under prevailing industrial conditions, would be unable to keep up this export trade, and legislation by way of restriction upon immigration would simply have the result, to use the words of Mr. David F. Schloss, "of making a gift of our exports of 'slop' clothes to Germany, which already carries on a considerable foreign trade in these articles, and which, while her protective system excludes English material from the German market, would be only too ready to supplant us in all markets of the world by the substitution for English goods of garments made in Germany, by German cheap labour, and of German cloth." Is it better, in fine, to buy cheap clothes from the Continent or to make them here cheap, and export the surplus that you do not need? Unless you forbid both the entry of cheap goods and cheap labour you will be in a worse plight than now, for, if you only forbid cheap labour, you may throw the cheap goods trade into other hands.

Let us now examine the position from another standpoint, whether the free competition of cheap immigrant labour with native workers may not diminish the volume of that aggregate industrial production to which all economists rightly attach so much importance. Mr. Gunton discusses in *Wealth and Progress*, 1887, ch. viii., at some detail, the action of wages on productive power. His conclusions, which should perhaps for the present be accepted with reserve until the question is more thoroughly considered, are that high wages in the long-run mean cheap products and low wages dear products. That high wages conduce to large consumption and large consumption introduces a more extensive use of capital with improved methods of production, and as a consequence always reduces prices. In a com-

parative table that deals with Great Britain and the principal continental countries, Mr. Gunton shows that wages are 84 per cent higher, the use of steam 117 per cent greater, and the cost of productive power 37 per cent less in England than on the average in continental countries. Moreover, this writer contends that a considerable amount of the social advance noticeable in Great Britain is due to her short-time industrial policy, and he enforces this proposition by a further table showing that in England—despite of shorter hours of toil—the increase in the average wages has been greater than in any nation of the Continent. Should these conclusions be sound, they will go far to sustain objections that have been made against the influx of cheap labour on the ground of its tending to impair the productive power of the community. May not the economist condemn the foreign colony in our midst as forming a barrier against the advance of a more productive industrial system? (cp. Mr. David A. Wells, *Practical Economics*, New York, 1885). As an example of the way in which high-class machinery brings in its train high wages for operatives, reference is made by that writer to the action of certain English shoe-manufacturers, who have introduced American machinery, and who find that it pays them better to work these machines at wages which are at least double those paid to the shoemaker under the old hand-system. So also it appears that in Nottingham the introduction of more complex and costly machines for lace-making has, while economising labour, augmented wages to the extent of over 100 per cent.

From this aspect the influx of cheap foreign labour may be deemed to have had an evil effect in retarding the advent of more favourable conditions of production.

In justice to the impoverished immigrant, it is but fair to state that there is nothing definite to show that he tends directly to become a burden on the community. Even in Whitechapel—the portion of the metropolis where they chiefly reside—the number of aliens in receipt of parochial aid is infinitesimal. There is, however, evidence from certain localities, such as Hackney and Shoreditch, of an increase of pauperism due to the crowding out of English labour by foreign immigration. Moreover, the industrial position of the small Jew workshops tends to that irregularity of work which is by far the most serious trial under which the people of London suffer; for the smaller the capital involved, and the less the permanent fixed charge for working a business, the better suited is it for irregular employment. The man who engages only two or three others in a workshop or in his own house, as is frequently the case with the petty Jew master, can, if work fails, send them all adrift to pick up a precarious living, but a large factory cannot stop at all without serious loss.

In attempting to estimate the effect of th influx of needy aliens on the social and mora condition of domestic workers, the followin points present themselves.

The evidence contained in the blue-book above referred to shows that a large proportio of the Russian and Polish immigrants ar exceedingly poor when they reach this country Their mode of life here is wretched in th extreme, their houses being in a most insanitar state and their food of a scanty nature. The are generally an inoffensive race, moral i their habits, and capable of hard work in spit of an inferior physique. They are ver industrious, toiling for long hours at low wages and maintaining existence on much less tha an English workman. Such are their char acteristics, and we find it stated by the com mittee of the House of Commons that, in thos trades which they follow, there has been, i consequence of their competition, a marked fal in wages and a tendency to reduce still lowe than at present the social and material condi tion of our own poor.

It is alleged, moreover, that the lowest clas of alien labourer exhibits an incapacity for, o an aversion to, anything in the shape of trad organisation. His early training, his socia surroundings and subservient position, rende the German, Russian, or Polish Jew generall unfitted for free combination, and he forms a serious obstacle to the onward march of labou in the industries affected by his immigration Now increased combination amongst the worker stands first among the needs of the time Trades unions have undoubtedly put the Eng lish workman on a better footing as regard his employers. In many cases they have raise the standard of comfort and increased th efficiency of the labourer. And it is claime for them that their moral effects have been a surprising as their economical. To all thi these aliens are for the most part indifferent and they constitute an inert mass that bars th progress of reform in the inferior grades of th trades concerned.

It should be stated, however, that recen efforts to organise the Jewish aliens at work i the boot trade have met with some success, an two Jewish branches of the National Union o Boot and Shoe Operatives, viz. the "Londo City" and "London East," are now establishe in the metropolis.

To sum up the situation regarding foreig labour in this country, we arrive at the follow ing conclusions. That against the better clas of workmen, who take fair wages and compet on an equal footing with domestic labour, n valid objection exists. That, as regards th wholesale coat-industry, it cannot be justl demurred to on the ground of its competin with native produce, but lies open to th reproach of barring the path of industria

reform. That in the retail tailoring department the immigrants do injuriously affect the earnings of both English men and women. That in the lower class of boot and shoe making, the immigrants have appropriated work formerly executed by native operatives, but that it is open to doubt whether the aggregate domestic industry has suffered. That in cabinetmaking and the other minor trades in which they are found, the foreigners have not exercised any appreciable effect. Still there are grave objections from both an economic and social point of view to any large influx of impecunious aliens, with a low standard of living. This has found expression in the Aliens Immigration Act of 1905, designed to hinder the influx of undesirable foreigners.

[The bibliography of foreign labour is exceedingly scanty.

The evidence given before the Royal Commission on Labour (1891-92) and that contained in the blue-book on *Emigration and Immigration of Foreigners* (1888-89), and on *The Sweating System* (1888-89) will repay careful perusal.—In Mr. Charles Booth's *Labour and Life of the People*, London, East (1889), the bearing of foreign labour upon certain selected trades is examined. Interesting details again are given in the *Report on the Sweating System*, 1887, compiled by Mr. Burnett. —Fawcett, in *Free Trade and Protection*, briefly alludes to imported labour, and so does Mr. Sidgwick in his *Principles of Political Economy*, pt. iii.—Mr. Gunton's *Wealth and Progress*, 1887, and Mr. David A. Wells's *Practical Economics*, New York, 1885, present many economic questions connected with the subject in a new light.

Industrial Statistics, and First Biennial Report of the Bureau of Labour Statistics of California, 1883-84.

Alien Immigration. Reports to the Board of Trade on Alien Immigration, Burnett and Schloss [c. 7113], 1893.] S. N. F.

FOREIGN LAW IN ENGLISH COURTS. There are many occasions on which English courts have to consider foreign law. This may occur with reference (1) to questions of personal status; (2) to contracts; (3) to questions as to the devolution of property after death; (4) to questions relating to real property situate outside of England.

(1) Questions as to personal status (legitimacy, majority, guardianship, marriage and divorce) depend upon the DOMICILE (*q.v.*) of the person concerned, but this is subject to the condition that the "status" described in a certain way in a foreign country is really the same as the "status" described in the same way in England. Thus "a marriage which is not that of one man and one woman, to the exclusion of all others, though it may pass by the name of a marriage, is not the status which the English law contemplates when dealing with the subject of marriage" (Sir Charles Butt in Brinkley *v.* Attorney-General, 15 Probate Division, on p. 79).

(2) The question what law governs a contract is frequently one of great difficulty. The general rule is that the law of the place where the contract is made ought to prevail in the absence of circumstances indicating a different intention (in *re* Missouri Steamship Co., 42 Ch. D. 321-326). As regards contracts of affreightment the well-known case of Lloyd *v.* Guibert (L. R. L. and B. 115) has established the rule that any questions relating to sea damage and its incidents are, subject to any contrary agreement between the parties, governed by the law of the country to which the ship belongs (see *The August* [91] Probate, 328).

(3) The devolution of personal property on death is regulated by the law of the testator's or intestate's DOMICILE (*q.v.*) at the time of his death; on the other hand the devolution of real property is regulated by the law of the country in which it is situate. Thus an English court, in dealing with the personal property left by a domiciled Scotchman, will have to consider the claims of his wife and children before having regard to the dispositions made by his will, as, according to Scotch law, these rights to a share of the residuary estate cannot be defeated by any testamentary dispositions.

(4) The law of the country where real property is situate must be considered in any questions as to priorities of mortgages, transmutation of possession, and rights of execution creditors. English courts have of course no direct jurisdiction as to foreign land, but by their control over the person of a defendant residing within the jurisdiction, they may indirectly obtain the same results as would have been obtained directly by a judgment affecting the land (Penn *v.* Lord Baltimore, i. Vesey, sr. 444). When an English court has to decide any point according to foreign law, "the opinions of experts who in their profession are acquainted with such law are the only admissible evidence thereof" (Stephen, *Digest of the Law of Evidence*, art. 49). It should be borne in mind that the provisions of the foreign law are considered with the sole object of ascertaining the mutual rights of the parties, but that as regards the remedies for the enforcement of such rights English law must always prevail, *e.g.* a contract for personal services could according to some systems of foreign law be specifically enforced, but nothing beyond damages could be obtained in an English court in respect of such a contract. It must also be pointed out that an English court "will

not enforce a contract against the public policy of this country, wherever it may be made" (Rousillon *v.* Rousillon, 14 Ch. D. 351, 369). For this reason a contract in restraint of trade, though it may be governed by French law and be valid according to French law, will, if void according to English law, not be enforced by an English court (see RESTRAINT OF TRADE).

FOREIGN TRADE, REGULATIONS OF. See TRADE, FOREIGN REGULATIONS of.

FOREIGN TRADERS AND THEIR RIGHTS.—In England, as in all countries in the middle ages, the position of the foreign trader landing on her shores was precarious. As a stranger he had no rights in the view of the ordinary law of the country unless specially protected by royal license. Such licenses were granted in some cases to individuals, in others to the subjects of certain sovereigns or the inhabitants of certain cities or countries. Of the former nature was the general treaty entered into by Offa and Charles the Great (797) providing that the subjects of each should be held worthy of justice. Still later we find licenses granted with the apparent desire of encouraging foreign merchants, and even of foreign settlers. Thus John granted foreign merchants protection in coming and going both for themselves and for their wares, while among the provisions of the Magna Carta there are two (cc. 41, 42), which deal with their safe conduct and their necessary freedom from *mala tolta*. Under Henry I. colonies of Flemish weavers appear to have been settled in different parts of the land. Toward the end of the 11th and beginning of the 12th centuries two definite policies with reference to the treatment of foreign merchants had gradually developed themselves. The king and the nobles on the one hand saw that it was to the advantage of the kingdom to be brought into connection with the industries and activities of foreign nations. It is possible that they were assisted to the perception of this by the benefits obviously accruing to themselves. On the other hand the English traders resented the intrusion of their foreign rivals within the country. As a matter of fact at one time much of the internal trade of the country seemed likely to slip out of native and into foreign hands. As the towns grew in size and power it was only natural that these views should find more forcible expression. During the struggle between Henry III. and Simon de Montfort, the cause of the towns was warmly espoused by the latter, who, seeing farther into the future, urged that the nation should strive to make itself self-supporting by wearing cloth wrought within the country, and staying its exports of wool to Flanders. After the victory of the royalists the towns suffered a period of reverse.

During this period, extending with intermissions from 1272 to 1376, the foreign trader was treated with all possible consideration and even encouragement. The period may be divided into two parts, during the earlier of which (viz. in the reign of Edward I.) foreign traders were encouraged without any particular attempt being made to encourage the trade and industry of the country itself. No doubt Edward was partly actuated by hostility to the towns, and especially to London, on account of the opposition encountered from them both by his father and himself. Their complaints and requests were alike set aside. Their main demands were these (1) That the foreign traders should dwell in the house of a citizen. (2) That retail trade should be prohibited to them. (3) That their term of residence should be limited to forty days. These points, except the last, were refused by Edward I., who definitely supported the foreigners and assured them security. The Carta Mercatoria (1303) is practically a judgment in favour of the foreign traders on all counts. During the weak rule of Edward II. the towns were able to reassert themselves and to obtain the acknowledgment of their claims. But when Edward III. began his effective reign the position changed. During this, the second, part of the period referred to, security and free rights etc. are guaranteed to the foreigners, but at the same time the policy of the king in encouraging home industry by prohibition on the export of wool and the import of foreign cloth, and by the settlement of foreign weavers in England who might instruct the English by their skill and example, averted the evil consequences which had seemed likely to ensue from the position which the foreign merchants had held and endeavoured to retain. England was ceasing to be merely a buyer of foreign goods and a source of supply for the wool required in foreign industries.

With the next period (1376-1461) a reaction in favour of the exclusive policy of the towns set in. In 1376 Edward III. made his peace with them by virtually affirming their demands in the points mentioned above, a course in which he is followed by his successors. The Lancastrians could ill afford to alienate popular support. In addition to legislation (as for instance 18 H. VI. c. 4) in the directions indicated, they added one provision of great interest in view of the later trade policy. Under Henry IV. (5 H. IV. c. 7), it was ordained that merchant strangers must spend what they obtain from the sale of the goods they bring on English goods of export. They are to export wares and not gold. Under Henry VI. (18 H. VI. c. 4) the foreign merchant was compelled to reside with an official host, who

was responsible for his employing his receipts in purchasing English commodities. (Jones, *Pol. Econ.*, ed. Whewell, p. 310.)

Gradually much of the legislation with regard to merchant strangers became obsolete in practice. It was frequently re-enacted but difficult to maintain. The real danger against which it was aimed had passed by. Not only had English industry become strong but the enterprises of the staplers and the merchant adventurers (see ADVENTURERS, MERCHANTS; STAPLE) had enabled the English to carry the war, as it were, into the country of the foreigners. They were pressing on to take their rightful share in the commerce of the world. From these and other causes the struggle of the later period under Richard III. and the early Tudors is not so much a struggle against the foreign trade in the more strict sense of the word, but against the intrusion of the stranger into the domain of industry.

FORESHORE. That part of the shore which lies between ordinary and low water mark, that is to say, between high and low water mark at the time of neap tide. Till the reign of Queen Elizabeth no distinction seems to have been made between foreshore and seashore above high-water mark. About 1568 a certain Thomas Digges wrote a treatise entitled *Proof of the Queen's Interest in lands left by the Sea and the salt shores thereof*, in which he maintained the crown's right, in virtue of the royal prerogative, to all the foreshore; a right which could not be alienated except by express grant. On this theory the crown lawyers acted till the beginning of the 18th century, when the claims of the crown were gradually allowed to die. They were revived in 1830, when Hall published his *Essay on the rights of the Crown and the Privileges of the Subject in the Seashores of the Realm.* The law at present seems to be that foreshore may be parcel of an estate or manor, that title to it may be shown by prescription, and that possession or enjoyment for sixty years displaces whatever rights the crown may have.

[S. A. Moore, *History and Law of the Foreshore and Seashore*, London, 1888.] A. E. S.

FORESTALL. In the stock-exchange sense this verb, which is practically obsolete and is seldom used, is almost synonymous with the verb to bull, meaning the act of speculation for the rise. A speculator, or band of speculators, may foresee a rise in the price of certain securities or commodities. The operation begins by the quiet buying up of such securities or commodities in order to forestall the rise which is expected to take place, in consequence of the buying of the operators, backed up or not, as the case may be, by favouring events. A forestaller in this sense is simply a BULL (*q.v.*), but opinion is divided as to the fairness of his operations. A. E.

FORESTALLERS AND REGRATORS. Together with regrating and engrossing, this signified the undue intervention of a middleman between the producer and consumer. Forestallers, regrators, and engrossers were viewed with disfavour, and their practices prohibited, because they were regarded as raising the price of commodities without adding to their value. In the act of 1551-52 (5 & 6 Edw. VI.), they are defined in the following terms: forestallers as "persons buying goods or victuals on their way to a market or port, or contracting to buy the same before actually brought for sale, or endeavouring by these or other means to enhance the price or prevent the supply"; regrators as "persons buying corn or other victuals, and reselling the same in the same market-place or in any other fair or market within four miles"; engrossers as "any buying corn growing, or any other corn, grain, butter, cheese, fish, or other dead victual, with intent to resell the same again." With regard to the foregoing definitions, the last names while describing the practice of the time, incorrectly restricts, so far as earlier times were concerned, the action of the engrosser to dealing with certain commodities. Regrating must be taken as the complete action embracing both forestalling and engrossing, which were particular stages in the action; but it is doubtful if any very definite discrimination was shown so far as the 13th and 14th centuries, in the use of the three terms. The practice they signify was condemned both because it might lead to monopoly, which was combated in its many forms, and because it resulted in unrighteous gains and enhancement of price. E. C. K. G.

Numerous English, Scotch, and Irish statutes have imposed heavy punishments on these offences, partly generally, partly in so far as they affect particular commodities (victuals, wines, cattle, butter and cheese, etc.), one of the earliest being the Statute of the Pillory of Henry III. (51 Hen. III. § 6—A.D. 1266), but they did not prove effectual, and some of the later English acts were, in 1772, repealed by 12 Geo. III. c. 71. As the older acts remained in force, and the judges, moreover, held that forestalling was an offence at common law as well as by statute, prosecutions continued down to 1800, in which year a person who, in the corn-market, bought wheat at 41s. and resold it to another dealer at 43s., was tried before Lord Kenyon and a jury (R. *v.* Rusby—Peake, Additional Nisi Prius Cases, 189). The judge refers to Adam Smith's observations on the subject, and holds that if that author "had lived to hear the evidence of to-day" he "would have seen whether such an offence exists and whether it is to be dreaded." It appears, however, that already in that case the judges were divided in opinion, and that no subsequent prosecutions took place. In 1844

"the offences of forestalling, regrating, and engrossing" were abolished by 7 & 8 Vict. c. 24, and cannot now form the subject of a prosecution in any part of the United Kingdom.

S.

FORESTS.

Forests have influenced the economic condition of countries and of their inhabitants in such widely different manners that it is desirable to indicate some of the leading branches of this subject.

As the hunting-grounds of monarchs and great nobles they were, during early and mediæval times, the occasion of severe and oppressive laws which lingered long in Europe, and vestiges of which may even now be traced at the present time. The article on FOREST, MEDIÆVAL, describes this part of the subject.

On the other hand the influence of forests on the climate of a country is very great. The article on FORESTS, ECONOMIC INFLUENCE OF, deals with this part of the question.

Forests, whether on hills or plains, are believed to promote the deposition of moisture from the atmosphere; and they are certainly most beneficial in preventing the rapid evaporation of what is deposited. Vast areas of the globe, in both tropical and temperate zones, have been rendered more or less sterile through the destruction of these forests, being hence exposed to destructive floods in the rainy season and to excessive droughts in the dry.

As an illustration of this, reference may be made to the remarks of Gibbon (*Decline and Fall*, vol. i.) on the extent of woodland in Germany, temp. Cæsar and Tacitus, and its striking effect on the climate, which supported reindeer and elks. He draws an ingenious analogy with Canada on the same parallels as London but icebound and forest-covered, and argues that clearing the soil will enable the sun to penetrate it and fertilise it.

FORESTS, MEDIÆVAL (English forests as typical of mediæval forests generally).

The DIALOGUS DE SCACCARIO (i. 12) defines the king's forest as "a safe mansion for wild beasts; not of any sort, but bred in the woods; not in any places, but particular and proper ones for this purpose; whence it is called forest, by changing the letter E into O, as *ferest*: that is, a station for wild beasts." The king has not a forest in every county, but "only in the wooded ones, where there are the best coverts and most fertile feedings for the beasts: neither does it matter to whom the woods belong, whether to the king or the nobles of the kingdom; for the beasts are at their liberty to range uncontrolled over every part of them" (ed. Madox, p. 29).

According to Manwood, there are four chi properties of a forest—vert, venison, particula laws, and proper officers, but he quotes Cok as giving eight—soil, covert, laws, court judges, officers, game, bounds (4 *Inst.* 289).

Forest Courts. Under the Norman kings thes seem to have been held by the foresters or keeper In later times there were three forest courts, th court of Attachments, the Swanimote, and th Justice Seat.

I. *The Court of Attachments* is so called becaus it was held *ad videndum attachiamenta.* Th Charter of the Forest (1217) provided that should be held every forty days, and therefore is sometimes called the Forty Days' Court. Befor the charter, it was held very often at the will c the chief forest officers, and was called the Wood mote, in Shropshire, the Woodplea Court. At th court, which only dealt with injuries to vert c venison, the foresters brought attachments to th verderers who enrolled them. Cases were als referred from this court to the Swanimote.

Attachments in the Forest were of three kinds 1. By goods and chattels. 2. By the body wit pledges and mainprise. 3. By the body withou pledges.

II. *The Swanimote.* The pleas in this court wer called pleas of the forest, and the verderers wer the proper judges. Before the Charter of th Forest the chief wardens and foresters held it a any time, and oppressed the people greatly b compelling them to attend it. By the Charter c the Forest (c. 8) it was to be held only thre times in the year. 1. Fifteen days befor Michaelmas, when the agistors of the king's wood met to take agistments. 2. About St. Martin' Day in winter, when they received pannage. I these two courts only the foresters, verderers, an agistors had jurisdiction. 3. Fifteen days befor St. John Baptist's Day, when the agistors met t fawn the deer. The foresters and verderers onl had jurisdiction in this court. But by the Ordin ance of the Forest, 1 (34 Edw. I.), presentment of offences in vert and venison were to be made a the next Swanimote before the foresters, verderers regarders, agistors, and other forest officers. I early times it appears that all freeholders living i the forest, and the four men and reeve of ever village, had to be present to hold inquisitions an serve on juries on pain of amercement by the chie warden. Among the offences inquired into a this court, besides offences in vert and venison were those of narrowing church-ways in th forest, digging for mines without licence, extor tions by forest officers. The regarders presente what mastiffs were kept in the forest unexpeditated Offenders indicted in the Swanimote in the words "Quod sunt communes malefactores de venation Domini Regis in foresta," might be outlawed.

III. *The Justice Seat* was held every third yea (4 *Inst.* 291), after forty days' notice by the sheriff proclamation. A jury of twenty-four, twenty, c eighteen was chosen from the freeholders an others in court, and the rolls of offences, seale with the verderer's seal at the Court of Attach ments and Swanimote, were presented.

Forest Officers.—Besides the *Custos totiu Forestæ* (mentioned Stat. 1 Edw. III. cap. 3) an

the *Supervisor Forestariorum*, there were six classes of forest officers,—stewards, verderers, foresters, regarders, agistors, woodwards. No one could hold more than one office at a time. By the Ordinance of the Forest, 34 Edw. I. c. 3 (1306), forest officers were exempt from attending assizes, juries, and inquests, without the forest.

Verderers were judicial officers of the king's forest chosen *in pleno comitatu* by his writ to the sheriff *de viridario eligendo*, and sworn. They were judges in the Swanimote, and directors of the other forest officers. They reviewed and enrolled attachments and presentments of trespass in vert and venison, and held inquisitions "by the four townships nearest to the forest" (Assize of the Forest, art. 7). The verderers, of whom there were usually four, were esquires or men of good estate.

Foresters were officers sworn to preserve vert and venison. They attached offenders and presented them at the forest courts. Foresters were appointed by the king's letters patent and held office sometimes for life, sometimes during pleasure. In some cases they paid fee-farm rents to the king, and a man might be a forester in fee *in jure uxoris*. That a woman might be a forester, but had to appoint a deputy, is shown by the sheriff's return to a writ of summons to the Justice Seat in Pickering Forest 8 Edw. III. (4 *Inst.* 310). Foresters might pursue offenders with fresh pursuit within their view out of the forest, but might not wound, beat, or kill them there as in some cases it was lawful (Stat. 21 Edw. I. of trespassers in parks, etc.) for them to do within the forest. They had the right of topping trees in another man's ground for browse (Assize of Pickering, 8 Edw. III., fo. 19). Those holding land in the forest paid yearly to the foresters at their scotale 5s. or one sheep or lamb, and when the forest and officers had been in existence time out of mind, the foresters were entitled by prescription to 1½d. a day, or to all windfall wood, shoulders and skin of deer, etc. They could neither hawk nor hunt nor license others to do so. Every forester had to appear at the Justice Seat and present his horn on his knees to the chief justice in eyre, who delivered it to the marshall. It was returned to the forester on payment of a fine of 6s. 8d.

Regarders were instituted by the Assize of the Forest, (c. 4) 1184. They were twelve knights who viewed and inquired into offences in vert and venison, concealments and defaults of other forest officers. They were appointed (1) by the king's letters patent or by the justice in eyre, for life, or in fee (4 *Inst.* 291). (2) On the king's writ to the sheriff to summon a *regard* of the forest. Vacancies by death were filled by the sheriff's election in the county court. In this case the office was held during the king's pleasure. (3) The chief justice in eyre appointed a substitute for a regarder to attend the Swanimote, *pro hac vice tantum*. It was necessary thus to keep up the number because the twelve had to agree concerning offences.

Regards, formerly called *visitatio memorum*, were held once in three years without a new writ, by regarders, foresters, and woodwards (Assize of the Forest, c. 10). The regarders appointed as many foresters for this as they thought fit. They surveyed wastes, assarts, and purprestures, and entered them on a roll. This they brought to the Court of Attachments on the Swanimote, when it was sealed and signed and was presented at the next Justice Seat. Woods within the forest metes but not part of the forest were out of regard.

Agistors were four officers appointed by letters patent. They took the beasts to pasture in the forest, presented trespasses done by cattle, looked after the demesne woods and lands enclosed, and received the cattle and payments of those living in the forest who had common in the unenclosed ground there. The king's demesne woods and lands were agisted by his foresters, verderers, and agistors, who met at the Swanimotes for this purpose, and to receive the money (Charter of the Forest, c. 8). The verderers' rolls of the Swanimote, on which the foresters' and verderers' agistments were enrolled, was the king's record to charge the agistors with the receipt, and they alone were answerable for it. (Assize of Pickering, 8 Edw. III., fo. 7, 8, 9.) They brought to the Justice Seat an account of the money received for pannage. The agistors, foresters, and verderers certified the chief justice in eyre when it was time to agist the king's demesne woods and lands, and he directed a commission to them to be returned at the next Justice Seat.

Agistment is the pasture or herbage of any ground, or the money taken for it. It is of two kinds. (1) Herbage—of woods, lands, and pastures. (2) Pannage—of woods alone, *i.e.* the mast of trees. The time of agistment in the king's demesne woods and lands for herbage, for commonable beasts, was from the Swanimote fifteen days before St. John the Baptist's Day until Holy Rood Day (14th September). (Charter of the Forest, c. 8). This was the fence month. The agistment for pannage, which might be for beasts not commonable (swine and hogs), lasted for forty days from the Swanimote fifteen days before Michaelmas until about St. Martin's Day.

Woodwards were officers who had the care of the woods and vert and presented offences at the Court of Attachments. If a subject had wood in the forest and his woodward did not appear at the justice seat to present his hatchet to the chief justice, his wood was seized to the king until he replevied it and paid a fine. If not replevied in a year, it remained in the king's hands for ever. An owner who appointed a woodward where there was not one before was fineable (Assize of Pickering, 8 Edw. III. fo. 8).

Assart, Purpresture, and Waste:

Assart. To assart "is to destroy any covert by the rooting it up and to make it plain ground" (Manwood). The word comes from the French *assartir* (*essarter*, Coke) or from the Latin *exuro* or possibly from *ad sero*, it being sometimes spelt *assertare*. The *Dialogus de Scaccario* (I. 13) says, "What you find called *occasiones* by Isidorus are generally said to be *estrepement;* that is, when the woods and brambles of the forest are occasionally cut down for food and coverts; after the cutting down of which, and the roots pulled up, the land is turned up and cultivated. But if the woods were cut down in such a manner

that scarcely the stock of an oak, or any other tree, remained standing in those parts where they had been cutting, and five could be found cut down together in one place, they looked upon it as waste" (Madox, p. 29). Forest land might not be assarted without the king's warrant, and land thus wrongfully assarted was seized into the king's hands and was redeemable by a fine. If this was not paid by the owner or his heir, the king continued to hold the land for ever. The fine for assarting was not fixed by the forest laws, but was levied at the discretion of the king or chief justice in eyre, usually according to the number and value of the acres assarted. A man found making assart or purpresture, if in the king's woods, was committed for the first offence without bail until he paid the fine to the king, if in the woods of a subject, he was bailable for the two first offences (see *State of Realm*, i. 243).

Restold, sheriff of Oxfordshire, in the reign of Henry I. owed seven pounds ten shillings "for the king's woods, which are so destroyed that no village can pay the farm for them." Robert, Earl of Leicester, "once on the eve of a visitation of the woods, generally called a survey, made every three years, procured the king's writ to be free from those sums of money that were demanded out of his land for waste, putting in the number arising out of them, which, being carried and read in public at the exchequer, all were amazed and astonished, saying does not this earl weaken our liberty" (*Dialogus*, i. 2; Madox, p. 28). Whole counties are found in the Pipe Rolls, *in misericordia pro foresta*. Wood rents paid for forest land, converted by the king's license into pasture, were not included in the farm of the crown lands on account of the fluctuation in their value.

Purpresture is thus described by the *Dialogus* (ii. 10): "It sometimes happens through the sheriff's negligence, or his officers', or by a long continuance of war, whereby those who lived near the estates appropriated to the crown, usurped part of them, and annexed them to their own possessions. But when the itinerant justices, by the oath of lawful men, discovered them, they rated them separately from the ferme of the county, and delivered them to the sheriff to be answered for separately; and these are called purprestures or seizures; which, when they are discovered, are taken as was said, from the possessors of them, and hence fall to the treasury. But if he from whom the seizure is taken committed the fact, he shall at the same time be punished by a very heavy fine, unless the king thinks proper to forgive it him; if he did not commit the fact, but is his heir, the recalling of the estate is held sufficient punishment" (Madox, p. 45). No man might enclose any ground in the forest to the hurt of the deer, and if he had a license to enclose he might not do it with a high hedge and ditch or a high paling, for this was against the Assize of the Forest (c. 10). A man might not build a house on his own free land in the forest without license, and a house so built was to be pulled down before a certain day, or a yearly rent paid to the king for it (Assize of Lancaster, 12 Edw. III., fo. 6). By the Assize of Clarendon c. 7 (1166) gaols might be built out of the king's woods.

Waste. "To fell or cut down any woods which grow scattering, or any thick covert in the forest, though on a man's own inheritance, yet if done without license of the chief justice in eyre, or view of the foresters, 'tis *waste*" (Manwood). The wood or place wasted was seized into th king's hand until the owner or his heir paid a fin assessed by the chief justice in eyre according t the number and value of the acres wasted (Assiz of Pickering, 8 Edw. III., fol. 22).

Purview was certain territory, adjoining th forest, bounded with unmovable boundaries an known by matter of record only. It was onc forest-land and disafforested by the perambulation made in 1218.

Forest Beasts. A forest was not a privilege place for all wild beasts and fowls, but only fo those of the forest, chase, and warren. The beast of the forest were, the hart, hind, and hare, an later, the boar and the wolf. But wolves wer almost destroyed by Edgar, and no care wa afterwards taken to preserve them. As late a Edward I.'s time there were many wolves i England, for, in 1281, Peter Corbet was commis sioned to destroy them in Gloucestershire, Wor cestershire, Herefordshire, Shropshire, and Staf fordshire: "Lupos cum hominibus, canibus, e ingeniis suis capiat et destruat modis omnibu quibus viderit expedire" (Rymer, i. 591).

Beasts of the chase were the buck, doe, and fox and formerly the marten and roe. Those of th warren were the hare, cony, pheasant, and part ridge. The difference between beasts of the fores and of the chase is that forest beasts frequen woods and coverts, and those of the chase ar field beasts. Each had its season, and there ar many interesting terms in this connection.

The so-called laws of Canute established th king's right to have forest "wherever I shall wis to have it." From this time until the granting of the Forest Charter in 1217, the king issued a commission under the great seal declaring hi will to make a forest in any place, and commanding that a perambulation be made. When this i returned and certified the king is entitled to th forest by matter of record. A writ was then issue to the sheriff commanding him to proclaim throug the county that the king had appointed such groun to be a forest, and that no one might hunt there after a certain day. But this made it only a chas until the king appointed the officers.

Strictly speaking, only the king could hold a forest, because he alone had power to appoint a justice in eyre of the forest. Forests were granted to subjects by letters patent, and all th officers remained except the justice in eyre.

A *Park* equally with a chase is a place of privileg for wild beasts of venery, and also for other wil beasts that are beasts of the forest and of th chase. It must be enclosed, and if open might b seized into the king's hands as a free chase Parks were held by subjects by license to impark The monastery of St. Albans appears to have ha a park in the vill adjoining. (Dom. i. 135 b. Domesday mentions sixteen subjects who hel parks. From the time of Edward I. most grea men had parks and chases, and the Patent Roll contain many licenses to impark.

A *Chase* is a harbour for wild beasts, usuall smaller than a forest and not having so man liberties, and larger and with a greater diversit of beasts than a park. The officers were keeper and woodwards. A chase differs from a forest i

that it may be in the hands of a subject, and from a park in that it is not enclosed.

A *Warren* is a franchise or place privileged either by prescription or by a grant from the king to keep beasts and fowls of warren. A free warren cannot be seized, though unenclosed.

Offenders in parks, chases, and warrens were punishable at common law, and by stat. 21 Edw. III. *De Malefactoribus in parcis et chaceis*, etc.

Haia is a hedge, sometimes a park or enclosure. Beasts were caught by driving them into a hedged or paled part of a wood or forest called a *haia*. The haias mentioned in Domesday were chiefly in Worcestershire, Herefordshire, Shropshire, and Cheshire. They occur in the Pipe Rolls as royal preserves. Edward III. had a chapel in his haia of Kingesle.

Names and Extent.—The woods mentioned in Saxon charters are mostly very small and are only in a few counties, but in early Saxon times the whole country between Tyne and Tees was a vast forest, the home of wild beasts. Only four forests are mentioned as such in Domesday besides the New Forest. These are Windsor Forest in Berkshire, Gravelinges Forest in Wiltshire, Winburne Forest in Dorsetshire, and Hucheuuode or Whichwood Forest in Oxfordshire. Neither Middlesex nor Essex forests are mentioned, though they must have existed, but *Forestarius de silva regis* occurs under Writtle in Essex (ii. 5 b). There are evident notices of forest land in Worcestershire, a forest is alluded to under Langebridge Hundred, Gloucestershire, and another in Herefordshire, but not by name (i. 179 b. 181, 184, 186). The forest of Dean is evidently alluded to under Dene (i. 167 b.), and under the lands of William de Ow in Wigheiete, Gloucestershire occurs this entry: "Alestan tenuit T. R. E. nunc est jussu Regis in foresta sua." In making the New Forest, William I. afforested portions of manors which were already woods. At least 17,000 acres were afforested in Hampshire between the reign of Edward the Confessor and the Domesday survey. Most of this land appears to have been on the borders of an older forest called by several writers Ytene. Names of parts of the forest ending in "ham," "ton," and "tune" show that they were sites of manors or villages. The royal demesnes in the reign of William I. are usually said to have consisted of 1422 manors, 30 chases, 781 parks, and 67 forests, but this is probably inaccurate (Stubbs, i. 403). From a passage in Abingdon cartulary, William seems to have extended the limits of Windsor Forest by four hides from Winckefeld towards Wildeshoram. Forests were probably at their greatest extent in John's reign, and until this time the whole of Cornwall, one of the least wooded counties, was under forest laws. The whole of Essex seems to have been afforested by John (Rot. de Oblatis, p. 102). The largest forest in England began to be destroyed when ironworks were established on a large scale in Sussex in the thirteenth century. Coke says that the newest forest in England is Hampton Court forest, made by act of parliament 31 Henry VIII. c. 5 (4 *Inst.* 301).

The forests of England are contemporary with the royal demesne, and both are supposed to have had their origin in the folc-land, but this view is rather shaken by the recent researches of Professor Vinogradoff (*Eng. Hist. Rev.* viij. 1). Gradually, as the king became looked on as more fully representative of the nation, the folc-land disappeared before the *terra regis* which we find in Domesday. The forests, a source of pleasure as well as of wealth, were considered as especially a royal possession. Among the Anglo-Saxons there were two chases, the higher reserved for the king, and the lower enjoyed by the holder of the land.

A great industry of the Anglo-Saxons was keeping pigs, and woodland was very valuable not only for deer, for fuel, and for wood for building, but chiefly for the support of pigs. A "wood of so many pigs," is a frequent entry in Domesday. In Ine's laws (A.D. 690) the worth of a tree is estimated by the number of swine that can stand under it. These laws forbade the felling and burning of trees, and imposed a fine of 60s. for burning a log in a wood, lest in this way woods should be destroyed. By Cnut's laws, cutting brushwood in the king's forest is forbidden, and the fine for destroying a tree which the beasts eat is 20s. Even in Henry I.'s time, Herbert Losinga, Bishop of Norwich, refused to give fuel from a wood at Thorpe to the sick, and preferred to give money, saying, "Tu vero custodi sylvam sanctæ Trinitatis sicut vis custodiri a sancta Trinitate" (Epis. viij.). Forests were sometimes waste land, *terra non lucrabilis*, often mentioned in the Pipe Rolls, and the preservation of game included, besides deer, boars, wolves, otters, and water-fowl, the fishing of rivers and coursing in great plains. An ancient privilege of the citizens of London confirmed by charter of Henry I. was coursing in Middlesex, Wiltshire and Surrey. In the so-called laws of Edward the Confessor, now known to be dated about 1217 (Liebermann, *Leges Anglorum*), public as well as royal rights were protected; any one claiming a private fishery or preserve for wild fowl without royal charter was fined by the jurors of the hundred, and a mill or weir made on a river was removed and the trespasser fined. The fence of the great rivers was removed by Magna Carta, cc. 47. By the forest laws attributed to Cnut, which are now known to be forgeries (Stubbs, *Select Charters*, 156; Liebermann, *Instituta Cnuti*, ed. R. Hist. Soc., p. 90), four thanes were appointed in every province to administer justice, and received a yearly salary of two hundred silver shillings. Under them were four inferior thanes (lesthegenes) who had the care of vert and venison, at a salary of sixty silver shillings, and under each of these were two men who watched at night and did the more servile work, receiving fifteen silver shillings yearly. They were all provided with horses and arms. Those of the two lower classes were tried for offences by the superior thanes, who were answerable only to the king. Harts, bisons, hares, and rabbits were enclosed, and the service of enclosing and stalling was imposed on the villeins and burghers. All men were allowed to shoot wolves and foxes outside the enclosure, and every two villeins had to keep a dog. Domesday mentions a class of royal huntsmen who seem to have all been English, and to have passed into

the service of William, and an elaborate establishment of the Royal Hunt is given in the *Constitutio Domus Regis* in the red book of the exchequer, which is now known to be as old as Henry I.'s time. After the Conquest all the remaining unenclosed folc-land was reserved to the crown, and the crown-land was further increased by the property of those who had fought in defence of England at Hastings.

William I. introduced the idea that hunting was the pastime of kings, to be followed simply for their pleasure and rigorously kept from their subjects.

In making the New Forest, villages and churches were destroyed with the one purpose of promoting the king's pleasure. Entries in Domesday show how the properties of individuals dwindled under the king whose fatherly affection was greater for the "tall deer" than for his people. The nature of the Conqueror's forest laws is known from later notices and from the complaints of chroniclers. "His great men bewailed it, and the poor men murmured thereat; but he was so obdurate that he recked not of the hatred of them all; but they must wholly follow the king's will, if they would live or have property, land, or even his peace." (*A. S. Chron.*, Rolls Series, p. 190). Under William II. these laws were probably enforced with increased severity, the greatest sufferers naturally being Englishmen who still kept some of their old property. Fifty such men were charged with breaking the Conqueror's forest laws, and proved their innocence by ordeal. William I. first attached the punishment of mutilation to offences against the forest laws: William II. punished such offences with death, even when the offenders were Normans of high rank and his own relations. But it must be remembered that William I. substituted mutilation for capital punishment in every case; in the forest laws it took the place of the fine imposed by Cnut and led the way to the still heavier penalty.

In the charter granted by Henry I. early in his reign, he says that by common consent of his barons he has kept the forests in his own hand as his father had them. He probably issued forest laws of great severity and extended their jurisdiction within all franchises, so keeping to himself the right of hunting throughout the kingdom. So greatly did he care for the deer for the sake of the delights of hunting, that he scarcely made a distinction between the slaying of deer and the slaying of men (William of Newburgh, i. 3.).

Stephen came to the throne anxious to conciliate the barons and full of concessions. He promised that he would not keep other men's woods in his hands "as King Henry had done, who every year impleaded them if they took venison in their own woods, or if they destroyed or lessened them for their own needs." In the charter granted at his first great council he promised to restore to the churches and the nation the forests added by Henry I., retaining those held by William I. and William II. He did not keep his promise (Stubbs, i. 403). But that it should have been made at such a time, and accepted by the barons, shows that in this direction the crown was becoming stronger; for the forests made by William II. which Henry I. had given up are now added to those of William I. In the unsettled times of Henry I. and Stephen encroachments and trespasses were made in the king's forests.

From the accession of Henry II. the administration of the forests occupies a very important and clearly-defined position, side by side with the common law. Early in his reign he appointed justices who visited the forests when the justices itinerant were on circuit. The general visitation of 1166, after the council of Clarendon, when two justices visited the whole country, was followed the next year by a survey of the forests, and this again by a circuit of the shires. Again in 1175 Henry himself held a great visitation of the forests at Nottingham, and in spite of the expostulations of the justiciary, he exacted large fines for the destruction of vert and venison which he had himself authorised in the war. Just before this, he had hanged four knights at Lichfield for the murder of a forester. The assize of Woodstock (A.D. 1184) is the first forest code now extant. The punishments were probably not quite so severe as those enforced by Henry I. The archbishops, bishops, earls, barons, knights, free tenants, and all other men were to attend the court of the forest justice at the summons of the chief forester (art. 11). This was enforced by Richard I., and repealed by the great charter (art. 44), and the charter of the forest (art. 2). By the connivance of the legate, Hugo Pierleoni, even the clergy, whom the common law could not touch, were to be subject to the law of the forests; the foresters were strictly enjoined not to hesitate to lay hands on them if they found them trespassing (art. 9). No one was to cut his own wood in the king's forest except for fuel, and even this, subject to the view of the forester (art. 3). Every one twelve years of age living within the forest bounds was to swear to the king's peace (art. 13).

In 1198, when Geoffrey Fitz-Peter succeeded Hubert Walter as justiciar, one of his first measures was to hold a visitation of the forests. He enlarged the assize of Woodstock, and attendance at the session of the forest justice, required by article 11, was enforced as rigorously as attendance at the shire and hundred courts. Fitz-Peter, however, was equally severe in other branches of the administration.

Forest Charter. The first forest charter is that of Henry III., issued by the earl marshall on 6th November 1217. Formerly a charter of John dated 1216 was cited on the authority of Matthew Paris, but this is really the charter of 1217 (Stubbs, i. 403). In a recently discovered charter of liberties, supposed to be a French forgery of 1216, references to the forests occur which seem to anticipate the charter of 1217 (*Eng. Hist. Rev.*, April 1894). All the forests made by Richard I. and John were to be at once disafforested (c. 3), but those of Henry II. only if they were to the damage of the owners of the woods afforested (c. 1). No one was to lose life or limb for offences in venison, but to be heavily fined. If he could not pay this fine he was to be imprisoned for a year and a day, and then in default of sureties was to be banished (art. 10). An archbishop, bishop, earl, or baron, going through

the forest, was to be free to take two beasts by view of the forester. If he was not present they were to cause a horn to be blown that they might not seem to be stealing the king's deer (c. 11). Only foresters in fee were to take tolls. Thus some of the abuses pressing most heavily on the people were removed, and this charter was to the forest administration very much what the great charter was to the constitution at large. In both cases tyranny led to a definition and assurance of liberties, thus making them more secure for the future than they would otherwise have been. In 1218, the year following the issue of the charter, a perambulation of the forests was held to determine their extent for all time. By an ordinance of the same year, Henry III. was restricted from making grants in perpetuity until he should be of age, and in 1227, when he attained his majority, this ordinance was said to invalidate all former grants unless they were now renewed on payment. At the parliament of Oxford the barons had again to seek redress against the encroachments of the king, who had re-afforested woods and lands disafforested by perambulation (art. 7), and had given warrens in forests disafforested by charter (c. 9).

In 1299, when Edward I. was in urgent need of money for the French war, he confirmed the great charter and the charter of the forest in return for a grant of one-eighth from the barons and knights. In the case of the forests, the phrase "salvo jure coronæ nostræ" was inserted, but a second confirmation was demanded and granted two months later, without this clause. In consequence of delay in carrying out disafforestations under the charter of the forest, twenty articles called "Articuli super Cartas" were passed the next year by the first complete parliament since 1296. Infringements of the charters were to be inquired into, and severe measures taken with regard to forest administration. A perambulation was held in 1301, and Edward confirmed the charters again at the parliament of Lincoln. In 1305, Clement V. granted him absolution from his oath, and this he only used to evade the forest articles which he had been compelled to grant in 1299 and 1301. The people still complained of the oppressions of forest officers. Their grievances were (1) Accusations and indictments were not made by lawful inquests, but by command of one or two foresters or verderers in order to extort money. (2) The great number of forest officers who were obliged to live near the forest, and to sell the wood and deer for their means of livelihood. These complaints were met in 1306 by the ordinance of the forest. One of its six articles provided that no forest officer was to take part in any assize, jury, or inquest without the forest (c. 3).

From the reign of Edward III. the hold of the crown on the forests became gradually weaker. Elizabeth and James I. alienated much of the forest territory, letting it on lease or in fee-farm, and great dissatisfaction was caused in 1641 by the attempts of Charles I. to reclaim this land. The king's title was found by inquisition, but by a jury acting under prejudiced direction. The Earl of Holland held a court as chief justice in eyre of the forests almost every year, though the old custom had been once in three years. The royal forests in Essex were so enlarged that they were said to include the whole county as in John's time. The Earl of Salisbury was nearly ruined by the loss of his estate near the New Forest. The boundaries of Rockingham Forest were extended from six to sixty miles, and enormous fines imposed on the trespassers. Thus the Earl of Salisbury was fined £2000, the Earl of Westmoreland, £19,000, and Sir Charles Hatton, £12,000. It is probable, however, that these fines were not exacted in full. The king obtained Richmond Park by depriving many of his subjects both of their freehold lands and their rights of common, but they probably received compensation. In 1641 the Act for the Limitation of the Forests determined for ever the extent of the royal forests according to their boundaries in 20 James I.

FORESTS, ECONOMIC ASPECTS OF. History shows that, except in arctic regions, there was once a natural covering of woodlands over the greater part of the globe. In the writings of Tacitus and Cæsar distinct evidence is given of the general distribution and character of these woodlands throughout France, Germany, and Britain; and in those parts of the world, such as the backwoods of America and the jungles of Burma, where increase in the population is only now gradually necessitating the clearance of the primeval forests in order to permit of the extension of arable and pasture land, the same processes may at the present day be seen as took place centuries ago in the more civilised and settled portions of the globe.

In many of the countries of Europe the processes by which the present ratio of woodland to total area has been attained are clearly traceable. To detail them or to examine into their causes is beyond the scope of this article. According to the Government Statistical Returns for 1905, the utilisation of the soil is as follows throughout most of the European countries:—

Country.	Latest data available for.	Total Area (acres), Lakes, Rivers, etc.	Total Acreage (approximate) under			
			Corn Crops.	Grass and Clover.	All other Crops.	Woodlands.
United Kingdom	1903	77,642,099	8,393,000	34,636,665	4,688,388	3,029,360
Germany	1900	133,585,000	38,177,789	27,759,244	14,741,693	34,569,794
France	1903	130,374,482	33,496,803	31,371,872	10,298,049	22,224,134
Russia in Europe (excl. Poland)	1902	1,244,867,351	174,592,143	72,646,845	21,379,220	425,564,842
Austria	1903	74,102,001	16,651,757	16,949,479	4,904,884	24,157,672
Hungary	1903	80,979,000	24,721,609	9,781,455	7,722,527	22,274,033
Sweden	1900	101,565,000	4,218,217	6,547,303	1,629,074	51,146,579
Italy	1895	70,787,286	20,518,000	17,922,000	13,442,000	10,266,310
Denmark	1901	9,500,000	2,366,899	2,827,284	1,045,767	682,823
Holland	1902	8,038,000	1,837,589	3,091,679	1,059,756	625,352
Belgium	1903	7,277,000	1,899,516	990,275	1,776,209	1,250,000

If we compare the most civilised countries of Europe, the following ratios will exhibit themselves :—

Country.	Percentage of Total Area under		
	Forest.	Tillage.	Pasturage.
United Kingdom	3¼	24½	36¾
France	17	48	17
Germany	25¼	48¼	16
Austria and Hungary	30	42	17

The proportion in which woodlands should be retained for climatic, national-economic considerations can never be stated in anything like an authoritative manner. Thanks to our insular position, and more particularly to the beneficial influence exerted on the climate of Britain by the Gulf Stream, the woodland area has with impunity been restricted to so low a ratio as would undoubtedly have entailed agricultural disaster in the interior of the continent of Europe. It is not merely the proportion of woodland to the total area that must be taken into account, but also the manner in which it is distributed over the surface of the country. Thus India, with a total area of 737,703,322 acres, has, according to the *Statistical Abstract for British India* for 1905, state forests aggregating 67,136,162 acres, or 9·5 per cent of the whole, without reckoning the unclassed jungles covering many thousands of square miles throughout the thinly-populated provinces of Burma and Assam ; but as these are not equally distributed over the length and breadth of the land, certain portions of Bengal, Madras, and Upper Burma are in particular now and again liable to famine when the south-west monsoon fails to deposit the normal quantities of moisture in any year.

In Britain the clearance of the forests was throughout the middle ages not only unchecked but directly encouraged, so that as early as the reign of Henry VII. the woodlands covered only about one-third of the total area ; in Ireland, too, so late as the 17th century the policy of clearance of forests was urged on by James I., Charles I., and Cromwell. On the continent, on the other hand, legal action was taken as early as the beginning of the 14th century to restrict clearance of woodlands. Thus in Germany in 1304 the first edict was issued forbidding fresh clearances in a part of Alsace, and ordering land to be replanted which had been cleared without permission. Similar edicts were issued in France by Charles IX. and Henry IV. in the 16th century, and a more stringent law on the subject was the celebrated *ordonnance des forêts* of 1669. At the time of the revolution this was practically set aside by a decree of 1790, but the impetus thus given to excessive clearance was so soon productive of evil results that a prohibition had to be issued from the consulate prohibiting further clearances. At the present day all circumstances relative to the clearance of woodland are provided for in the *code forestier*, framed for the better administration of the national, communal, and private forests.

The Climatic Influence of Forests is discussed by Humboldt, who in the *Aspects of Nature* laments that the wants and restless activity of man "gradually despoil the face of the earth of the refreshing shades which still rejoice the eye in Northern and Middle Europe, and which, even more than any historic documents, prove the recent date and youth of our civilisation." The subject was never studied seriously until 1867, when observations were begun by Prof. E. Ebermayer of Munich, of which the first results were published in 1873 in his celebrated work *Die physicalischen Einwirkungen des Waldes auf Luft und Boden*. Since then, however, more extended observations conducted throughout Germany, France, and Switzerland have in many ways caused his deductions to be modified. The best *résumé* of the work accomplished in this direction is to be found in Prof. R. Weber's *Die Aufgaben der Forstwirthschaft*, forming the opening portion of Prof. J. Lorey's *Handbuch der Forstwissenschaft*, 1886, from which the following results are taken.

1. *As regards Atmospheric Temperature.* The average results of observations made during ten years (1875-85) in different kinds of forest at heights varying from 10 to 3000 feet above the sea-level, and at latitudes between 47½° to 55¼° N., showed that in general the mean atmospheric temperature in woodlands is cooler than in the open, as shown in the following table :—

Temperature of Woodland Air, compared with that of Air in the Open.		
In ° Fahr.	At 5 feet above the ground.	In the Tree-crown.
Spring . . .	1·24° cooler	0·57° cooler
Summer . . .	2·55° ,,	1·47° ,,
Autumn . . .	1·13° ,,	0·41° ,,
Winter . . .	0·61° ,,	0·03° warmer
Annual Average of all recorded Observations.	1·044° cooler	0·414° cooler

The annual average temperature in woods growing in closed canopy is found to be lower than in the open, although the crowns of the trees are on the whole a little warmer in winter. The difference is greatest in summer, least in winter, and about midway between these extremes in spring and autumn; but the mean annual difference seldom amounts to over 1° Fahr. near the ground, and to scarcely ½° in the crown. The prevention of insolation of the soil during the long hot days of summer, and the rapid transpiration of the foliage, exert greater influence on the atmospheric temperature than can be ascribed to shelter from wind and decrease of nocturnal radiation.

Observations made in southern Germany established the fact that in the forests it is cooler during the day, and warmer during the night than in the open. During the day the shade afforded by the crowns of the trees keeps the air cool, whilst the leafy canopy interferes with the radiation of warmth during the night. These equalising influences are naturally strongest during spring, summer, and autumn, when foliage is most abundant, whilst in winter the coniferous woods with evergreen canopy are milder than deciduous forests. Owing to these differences in temperature, beneficial currents of air set in between the woodlands and the open country, in the same manner as land and sea breezes are formed. During the day the cooler and moister air of the forest flows out to the open, to take the place of the heated air ascending; at night a current sets in from the open, cooled by radiation, towards the forest. The immediate action of forests is, therefore, to modify the daily maxima and minima of atmospheric temperature, hence it may be deduced that a comparison of the absolute extremes of temperature during the year must exhibit the sum total of the influence exerted by woodlands on atmospheric temperature. As extremes of temperature are bad alike for man and beast, and for agricultural operations, this modifying effect can sometimes be of immense importance from a national-economic point of view, for many places that were once fertile are now little better than barren wastes in consequence of the reckless denudation of forest. The German observations yielded the following results on this point:—

Average difference of temperature in the forest and in the open at 5 feet above the ground.	
Exhibited by maxima of July	Exhibited by minima of January
6·82° Fahr. cooler in forest	2·05° Fahr. warmer in forest

In making these observations it was found that geographical position, exposure to winds, and the nature of the forest exerted modifying influences to a certain, and often not inconsiderable extent.

2. *As regards soil temperature*, observations in southern Germany gave the following results:—

Average soil temperature in the forest compared with that in the open.
−=cooler by. +=warmer by.

In ° Fahr.	At surface	At 1 ft. depth	At 2 ft depth	At 3 ft. depth	At 4 ft. depth
Spring	−4·08°	−3·08°	−3·24°	−2·79°	−2·32°
Summer	−6·10°	−6·71°	−7·07°	−6·86°	−6·53°
Autumn	−1·85°	−2·16°	−3·04°	−3·26°	−3·58°
Winter.....	−0·23°	+0·43°	−0·45°	−0·22°	−0·34°
Annual average	−3·15°	−2·88°	−3·45°	−3·28°	−3·19°

Thus the mean annual temperature of the soil in woods is at all these depths of observation cooler than in the open. The differences are greatest in summer, least in winter, and about the mean in spring and autumn. In countries with warm summers this reduction of soil temperature over large areas by means of woods has a decidedly beneficial tendency.

3. *As regards the Degree of Atmospheric Humidity.*—Observations throughout Germany and Switzerland have shown that as regards the *absolute humidity of the air*, forests have no appreciable climatic effect, although they of course exert very great influence on its *relative humidity*. Taking all the observations together, the results arrived at show that the mean annual relative humidity of woodland air is from 3½ to 10 per cent greater than that of air in the open, but that the difference varies greatly according to the season of the year, being greatest in summer and autumn and least in winter and spring.

4. *As regards the Precipitation of Aqueous Vapour.*—As has above been stated, woodland air is cooler than that in the open, whilst the trees themselves are also cooler, especially in summer, hence when a current of air is wafted from the open into the forest its temperature falls and it approaches nearer to the point of saturation, *i.e.* its relative humidity increases. If it were already near the point of saturation, the formation of dew must take place. Woodlands, therefore, act as condensers of atmospheric moisture, and decrease the absolute humidity of the air whilst increasing its relative humidity; at the same time they also add to the humidity of the air by transpiration. Very

careful observations made for the purpose have as yet failed to establish the actual effect of forests in the precipitation of dew and rainfall. Corrections of such various sorts have to be made for the correlation of readings at different points in the forest and in the open, as to make the deductions open to serious objections. Thus readings at 192 points of observation in Germany, corrected as carefully as possible with reference to causes of difference, lead to no other trustworthy inference than that at high altitudes large extents of woodland must considerably increase the local rainfall. But as nearly one-fourth of the rainfall is actually intercepted by the crowns and stems of the trees, forest growth offers great mechanical advantages in preventing the scouring and washing away of soil in mountainous tracts. Although it is a generally accepted dictum that rainfall is greater near large forests than in the open under similar physical conditions, this has not yet been proved by scientific observers. But owing to their lower temperature, their greater relative humidity, and the mechanical obstruction they offer to currents of air, forests certainly act as condensers of aqueous vapour, though their influence in this respect is much greater in mountainous tracts than on plains.

5. *As regards Evaporation of Soil-moisture.*—Observations made in Germany and Austria during ten years (1875-85) proved that, even in the vicinity of the forest, evaporation in the open was considerably greater than within the woods. The results are as follows:—

	Water evaporated.
In the Open	20·9 inches
In the Forest	9·5 „
Lower in forest than the open by	11·4 inches
Evaporation in forest expressed in the percentage of that in the open . .	46 %

The practical importance of this will be at once seen when it is recollected that the mineral food-supplies can only be taken up from the soil by the rootlets of plants when presented in the form of *soluble* salts.

6. *As regards the Feeding of Streams and the Protection of the Soil.* The action of forests is to retain in the soil a large proportion of the rainfall, which, by percolation to the lower layers and the subsoil, tends to feed the streams perennially, and to maintain a constant supply of moisture. That the mechanical action of rain in regard to washing away soil on steep slopes is interfered with by the crowns and stems of trees, has already been noted. But by the decomposition of dead foliage, etc., to form *humus* or mould, a strongly hygroscopic admixture is conveyed to the upper layer of the soil, thereby enabling it to imbibe and retain moisture with sponge-like capacity, and giving the latter time to percolate instead of running off rapidly on sloping ground. The evaporating action of sun and wind is counteracted by the leaf-canopy, which also prevents radiation of warmth at night. When large tracts of country are denuded of forest, increase of temperature during the days of summer, rapid radiation of warmth by night, diminished dew-formation in spring and summer, and unchecked evaporation of moisture (through insolation and the free play of winds), must be the inevitable results. Such consequences, involving serious agricultural disasters, might easily be pointed out in many parts of continental Europe, Western Asia, and India; references may, however, be made on these matters to the articles in the *National Review*, "Forest Science," July 1889, p. 691, and the *Edinburgh Review*, "The Penury of Russia," January 1893. The latter instance is a terrible object-lesson regarding the indiscriminate clearing of woodlands; in the nine years ending in 1887 a decrease of no less than 101,861,668 acres took place in the area returned as woodlands, a great deal of which has simply become waste land. Forests tend to break the violence of the rainfall, retain temporarily a large proportion on the stem and branches, from which it trickles to the ground, bind the soil by means of their roots and the humus layer formed by the dead foliage, and imbibe and retain the moisture till it can gradually percolate to the lower strata for the maintenance of the beneficial perennial streams. In the alpine districts of southern Europe "ban-forests" are subject to special laws, being retained as protection against landslips, avalanches, etc.

7. *As regards General Hygienic Effect on the Atmosphere.*—Whilst fresh clearance of forest tracts, especially in tropical and sub-tropical countries, induces fever and ague, the re-planting of feverish localities, like the Campagna di Roma and the Tuscan marshes, has improved their climate. But these effects are more likely due to the degree of direct insolation, freely accorded in the one case, and counteracted in the other, than to any hygienic property inherent in tree-growth. In the latter case the evaporation of stagnating soil-moisture owing to the transpiration through the foliage would of itself go far to remove causes of insalubrity.

Ebermayer's experiments showed that woodland air had most ozone in winter, which proves that the amount of ozone it retains can not be due to any chemical action of the foliage, for even the evergreen conifers only transpire during the winter period of rest. But as in the decomposition of the carbonic acid of the air by tree-foliage from spring to autumn, the carbon is absorbed and oxygen set free, and as during the period of active vegetation the hours of sunlight far outnumber those of

darkness—when oxygen is imbibed by the foliage, and carbon set free—it follows that, apart from their invaluable æsthetic influence, the planting of trees in towns and cities decidedly tends towards the purification of the air from its excess of carbonic acid; trees and forests act like filters in fact.

The Monetary Value of Forests and of Forest Produce.—In actuarial calculations affecting woodlands a somewhat lower rate of interest must be adopted than is obtainable on ordinary investments, owing mainly to the social prestige which usually accompanies large wooded estates with good shooting, and also to the fact that timber and forest produce have hitherto steadily appreciated in value whilst other commodities have relatively depreciated; this matter is well stated in Prof. G. Heyer's *Einleitung zur Waldwerthrechnung*, 1883, pp. 3-16. What rates of interest should be fixed on for a comparison of the *rentability* of the agricultural or the sylvicultural utilisation of any soil depends on varying local conditions. Considering the much longer period elapsing between the formation and the realisation of timber crops, and the greater dangers to which they are meanwhile exposed from wind, fire, insects, etc., a higher rate of interest might naturally be looked for; but in most civilised countries, as a matter of fact, woodlands are practically confined to tracts which, either from poverty of soil or other physical causes, are unsuited for agricultural occupation, or pay better under timber. According to Heyer, whilst the ordinary rate of interest was from 4 to 4½ per cent throughout Germany, the rate of interest for calculations relating to agricultural soils was 2 to 3 per cent, and that prescribed for sylvicultural calculations in the state forests was from 2½ to 3 per cent. The economic importance of the *steady appreciation in the market value of forest produce* is a feature that deserves attention, for this is bound to be accentuated in the future, seeing that whilst population and demands for timber, etc., are constantly increasing, the woodland area, and therefore the possibility of satisfying these demands easily, are constantly decreasing throughout the whole world.

Prof. K. Gayer, in his rectorial address before the university of Munich in 1889, *Der Wald im Wechsel der Zeiten*, page 15, states that the 34½ millions of acres of woodland in Germany annually produce about 60,000,000 cubic meters of timber and fuel, and yield annually about £20,000,000 to £22,500,000, which at 2 per cent would make their capital value about £1,000,000,000. And, according to Weber, *op. cit.* page 85, it was found in 1875 that no less than 583,000 persons were engaged in industries directly dependent on the timber trade, in addition to £4,150,000 being annually disbursed for various manipulations before the produce reached the buyer, and without reckoning costs of transport thereafter.

The most valuable forests in the British empire are undoubtedly those of India, which yielded a revenue of £1,481,116 during the year 1903-1904. Even accepting 2 per cent as the rate of interest obtained, this would make their capital value about £74,000,000; but it is probably more.

Even the 3,029,360 acres of woodland in the United Kingdom represent a very considerable capital. Taking the average period of rotation of the timber crops at 90 years, the rental of the land at 5s. per acre per annum, the cost of planting, etc., at £2 an acre, and the rate of interest at which the landowner is content to work as 2½ per cent, their actual cost at the present moment (treating them as ranging normally up to 90 years) would amount to $(3,029,360 \times £2 : 5s.)\, 1{\cdot}025^{45} = £20,652,661$. But the timber and minor forest produce of home growth is entirely inadequate to supply the demands existing in Britain, as may be seen from the following statement showing the quantities of the chief imports during 1903, and the countries whence they were obtained:—

Imports. All kinds of Wood, Timber.	Value. 1903.
From Russia .	£6,639,469
,, Sweden .	5,053,309
,, Norway . . .	3,224,344
,, Germany . . .	1,365,283
,, United States . .	5,214,730
,, British East India .	687,430
,, ,, North America	4,888,000
,, other counties . .	2,395,699
Total value of Imports	£29,468,218
Deduct value of Exports .	569,477
Excess value of Imports over Exports . .	£28,898,741

Value of the different kinds of Forest produce imported into the United Kingdom, 1903:—

Wood and Timber—	
Hewn—	
Pit wood or Pit props .	£2,535,365
Fir, other than Pit wood or Pit props .	1,542,168
Oak . .	1,184,442
Teak	887,431

FORETHOUGHT. Forethought may be defined as that species of imagination which enables a man to realise at any given time his probable wants in the future. What is not immediately present to the senses cannot excite intense fear or desire unless it be vividly realised by the imagination. Without forethought, therefore, it would be impossible for a man to deny himself now in order that he might enjoy hereafter. He might desire riches as the means of instant enjoyment; but he would not accumulate riches as the means either of enjoyment or of production in the future. Thus forethought is the necessary condition of all saving, and therefore of the formation of capital.

The degree of forethought possessed by any race or individual is determined by causes too numerous and too obscure for complete enumeration. Among the more obvious of these causes is climate. In some countries the climate is so benign as to provide the means of life and of pleasure almost without any assistance from man, in others the climate is so rigorous that, with the most pinching parsimony, only a bare existence can be gained. In neither case can we expect much forethought from the inhabitants. In the one case they are comfortable without forethought, in the other case no forethought could make them comfortable. Moreover a luxurious climate relaxes, and a frozen climate benumbs the intellectual powers. It is in the intermediate climates that man can do most to better his condition and has most mental energy to conceive and to desire improvement.

Another influence which affects forethought is religion. Some religions have stimulated, others have repressed the natural instinct to enjoy the present which so often operates against forethought. It is true that the ascetic temper which condemns pleasure condemns also the pursuit of riches. Yet no communities have developed a higher degree of forethought than Scotland and New England, where an austere religion has been all but universally accepted. In such communities the enjoyment of the passing hour is doubly difficult, and the mind even of the ordinary man is forced to direct itself upon the future. A third influence is government. Men will not deny themselves in order to attain a remote object unless they have fair grounds for hoping that their self-denial will bear fruit. Such grounds they can have only under a tolerably good government. A government which takes an undue proportion of the national means to fill its treasury, or which permits its servants to practise extortion, or which fails to defend public order against foreign assailants or domestic criminals, or which maintains the thoughtless in comfort at the charge of the provident—still more a government which commits many of these faults—will effectually weaken forethought, and may in time reduce the richest country to penury. On the other hand a good and orderly government will stimulate forethought to such an extent as to cause a steady accumulation of capital. Another influence is education. In so far as education weakens the force of momentary appetite, and strengthens the reflective and imaginative powers, it tends to increase forethought.

Yet another influence affecting forethought is the opportunity for safe and profitable investment of savings. The motives to save are stronger where savings can be not merely hoarded but so employed as to produce an immediate return. In this way the modern development of joint-stock companies has done much to diffuse forethought. But where forethought is general the accumulation of capital will gradually lower the rate of interest and profit obtainable. Whether this process will ultimately weaken forethought by lessening its returns is a question which we are hardly in a

position to solve. We have not sufficient materials for judging the effect of a very low rate of interest continued for a very long time. As yet the rate even in the richest countries appears sufficient to stimulate forethought. A certain amount of saving has always been prompted by the need of a reserve fund against old age, sickness, or other calamity, and has therefore been independent of the attraction of interest, indeed where the rate of interest is low more must be saved for these purposes and for the benefit of children, to produce the same income. But such saving as is prompted by the desire to better one's condition, to increase one's income, must be discouraged as the future return to a given exertion of immediate self-denial becomes less and less. Saving of this kind was narrowly restricted in those states of society in which there were few modes of safe and lucrative investment. Much that would now be saved was then spent upon stately houses, large retinues, massive plate, and gay clothing. It is at all events possible that, as investments become less profitable, the taste for unproductive expenditure may become stronger. Taking mankind as a whole, it may safely be said that they are deficient in forethought. Yet there are many individuals whose forethought is excessive. Forethought is not, like truth or justice, a virtue of which one cannot have too much. It is a faculty which needs to be balanced by other faculties. Men defective in a healthy power of enjoyment or constitutionally timid or stunted in feeling by early privation do frequently over-estimate the future in comparison with the present, and persevere in this error until they are ready to descend into the grave. In such men the habit of looking to the future has become a disease fatal to happiness and pernicious to their higher nature. Nay, it sometimes goes so far as to defeat its own object, the accumulation of riches. For the miser will deny himself the recreation and even the food needful to his full efficiency as a producer. The firm and tranquil temper which can duly balance the future with the present may not always tend to the greatest individual accumulation, but it is most conducive to the general well-being.

[Adam Smith, *Wealth of Nations*, bk. ii. ch. iii., Of the Accumulation of Capital.—Mill, *Principles of Political Economy*, bk. i. ch. xi. ; On the Law of the Increase of Capital.—Marshall, *Principles of Economics*, bk. iv. ch. vii., On the Growth of Wealth.—Bagehot, *Economic Studies*.]

F. C. M.

FORFEITURE is the loss of property or of rights in consequence of some act or omission on the part of the owner of the property or of the person in whom the right was vested. Forfeiture of leasehold property in consequence of a breach of covenant on the part of the lessor is now comparatively rare, as recent legislation enables the lessee in most cases to remedy the breach before the lessor can enforce his right (see ENTRY, RIGHT OF). Forfeiture may occur through the non-observance of a condition imposed by the will or settlement under which property is held (*e.g.* when property is given over to a third person in the event of the tenant for life, remarrying, or changing his religion or his name, or becoming a bankrupt, etc.). E. S.

Formerly, when a man was convicted of treason or felony, he forfeited all his property both real and personal. By a barbarous legal fiction his blood was said to be corrupted so that descent could not be traced through him, and upon his execution his children had no claim to his land. It therefore escheated to the lord in cases of felony and to the crown in cases of treason. It was thus that the demesne of the crown was so often enlarged when great landowners suffered for treason. The personal property, whether of the traitor or of the felon, passed to the crown immediately upon his conviction. This aggravation of punishment was objectionable on many grounds. If the felon or traitor actually suffered death, any further punishment was unnecessary. Forfeiture of property in such a case bore most hardly on the innocent widow and children. If the punishment of death were remitted there was the further inconvenience of taking away a man's livelihood and adding to his temptations as soon as he was set at large. Lastly the penalty of forfeiture acted as a temptation to rulers to seek the conviction of a wealthy accused person. For these reasons it had often been condemned by theoretical writers before it was abolished by the act 33 & 34 Vict. c. 23. Under this act, however, a person convicted of felony and sentenced to twelve months' imprisonment or upwards is still liable to forfeit any office under the crown, any ecclesiastical benefice, any place in a corporation, or any pension which he may hold.

Another case of forfeiture occurs when the lessee of land breaks a covenant in his lease to which a proviso for re-entry is attached. In such a case the lessor could formerly sue on the covenant without more ado. But by the Conveyancing and Law of Property Act of 1881 (44 & 45 Vict. c. 41) he must now serve on the lessee a notice specifying the particular breach complained of, and require him to remedy the breach or make compensation. Only if the lessee fails to comply within a reasonable time can he enforce his right of re-entry, and even then the court has full discretion to grant the lessee relief on reasonable terms. These provisions do not apply to the breach of a covenant against underletting, or to the case of non-payment of rent. Indeed they are only intended to protect the lessee against forfeiture in cases where it is an excessive penalty, and thus to increase his reasonable security.

Under the feudal land law a freehold tenant might forfeit his land by certain breaches of the conditions on which he held it.

Smugglers are still liable to forfeiture of the goods smuggled, in addition to other penalties.

The Post Office Savings Bank regulations decree the forfeiture of deposits in other savings banks which are concealed at the time the Post Office account is opened, in spite of the depositor's declaration to the contrary. Partial forfeiture to the National Debt Commissioners under this rule are of constant occurrence.

[Sir James Stephen's *History of the Criminal Law of England*, vol. i. pp. 487-489.—Goodeve, *Modern Law of Real Property.*—Williams, *Law of Real Property.*—Woodfall, *Law of Landlord and Tenant.*—*The Conveyancing and Law of Property Act*, 1881, ed. Clark and Brett or ed. Wolstenholme.] F. C. M.

FORGED TRANSFER. The risk to which buyers of shares, stock, or debentures transferable by deed of transfer were formerly exposed, owing to the possibility of the vendor's signature on the transfer being forged, has been considerably reduced by the Forged Transfer Acts of 1891 and 1892. These acts enable companies and local authorities to make compensation to persons to whom certificates have been issued in pursuance of such forged transfers, and have already been very widely adopted. It must, however, be borne in mind that the adoption of the acts is purely voluntary, and that in the case of companies who refuse to recognise the rights of defrauded purchasers, the old state of things continues. E. S.

FORGERY. "There is," says Mr. Justice Stephen (*History of the Criminal Law*, vol. iii. p. 186), "no statutory definition of forgery. The common law definition is making a false document with intent to defraud." Making includes, not merely the composition of an entire document, but also altering a document or signing it in the name of another person. Intent to defraud is presumed to exist if at the time of making there was in existence a specific person capable of being defrauded thereby. There are as many kinds of forgery as there are instruments which can be forged. Forgery was a misdemeanour at common law.

The first severe statute directed against forgery is the 5 Eliz. c. 14. In the 18th century the use of paper money and the increase of trade gave an impetus to forgery which it was sought to counteract by statutes making many forms of forgery capital. The law was mitigated by the Act 11 Geo. IV. and 1 Will. IV. c. 66, and again by the Act 7 Will. IV. and 1 Vict. c. 84, but forgery of the great seal remained treason and capital until 1861, in which year the statute law relating to forgery was consolidated by the Forgery Act 1861 (24 & 25 Vict. c. 98). Forgery of the great seal, of securities in the public funds, of bank-notes, bills of exchange, wills, and certain other documents, is punishable by penal servitude for life. Other kinds of forgery are punishable with maximum terms of fourteen and seventeen years' penal servitude respectively. Forgery of a trade mark makes the offender liable to two years' imprisonment with hard labour. The making or possessing of instruments or paper for forging bank-notes is also severely punished. In general the uttering of a forged document, *i.e.* the offering or disposing of a forged document knowing it to be forged, is punishable as severely as the act of forging. The scope of forgery increases with the multiplication of documents consequent on the advance of civilisation, and the progress of science perhaps affords as many new expedients to the forger as safeguards to the public. These considerations may perhaps justify the great severity of even the modern law of forgery.

[For the present state of the law of forgery see Stephen, *Digest of the Criminal Law*, Arts. 355-366, and for its development see Stephen, *History of the Criminal Law*, vol. iii. pp. 180-188.] F. C. M.

FORMALEONI, Vincenzo (18th cent.), a man of much learning, born and lived at Venice.

Saggio sulla Nautica dei Veneziani, con una illustrazione di alcune carte idrografiche della Biblioteca di S. Marco in Venezia, dimostranti l'Isole Antille prima della scoperta di Cristoforo Colombo, Venezia, 1785 (translated into French by Chev. Dr. Hénier, Venise, 1788).—*Storia filosofica e politica della Navigazione, del commercio e delle colonie degli antichi, nel Mar Nero*, Venezia, 1788 (id. id., Venise, 1791). A. B.

FORMARIAGE, Droit de. This was a feudal right of the French lords to exact a payment from a female serf when she married either a freeman or the serf of another lord. R. L.

FORONDA, Valentin de. In his *Miscelánea* (Madrid, 1787), in his *Cartas sobre los asuntos mas exquisitos de la economia política.* (Letters on the most interesting questions of Political Economy) (Madrid, 1794), and in his *Cartas sobre la policía* (Letters on Policy). (Madrid, 1801). Foronda was one of the first to popularise the new economic ideas in Spain. He advocates commercial and industrial *laissez-faire*, and opposed all measures contrary to free trade, "the pole star which ought always to be kept in sight."

Della prosperità nazionale, dell' equilibrio del commercio e dell' istituzione delle dogane, Firenze, Tofani, 1789. (*v.* T. I° of the *Scritti di Pubblica Economia di Giovanni Fabbroni*, pp.83-110). A. B.

FORSTER, Nathaniel, D.D. (1726 or 1727-1790), rector of All Saints, Colchester.

Besides some sermons and a pamphlet on Wilkes, he wrote *An Enquiry into the causes of the Present High Price of Provisions*, 1767, and an *Answer to Sir John Dalrymple's pamphlet upon the Exportation of Wool*, 1783. Perhaps the best parts of the *Enquiry* are the arguments against breeding horses instead of oxen for farm work, and an explanation of the effect of enclosures upon the price of pigs, poultry, and eggs. The economic arguments are weakened by his neglect of the rate of wages, and by his treatment of wealth and money as synonymous. In his pamphlet on wool he strongly objects to the exportation of raw wool, on account of home manufactures, which, he argues, would in consequence rise in price and be undersold by foreign goods.

[*European Magazine*, vol. xvii., 320.—*Dictionary of National Biography*.—M'Culloch, *Literature of Political Economy*.] E. G. P.

FORTI, E., was, from 1875 to 1878, editor of the *Giornale degli Economisti*, at Padua, and a strong supporter of the "socialists of the chair."

L' Azione economica del Parlamento, dal 23 Nov. 1874 al 20 Giugno 1875, e dal 15 Nov. 1875 al 26 Luglio 1876.—*Giorn. degli Economisti*, Padova, 1875 e 1876. A. B.

FORTREY, SAMUEL (1622-1681), author of *England's Interest and Improvement consisting in the increase of the Store and Trade of this Kingdom*, Cambridge, 1663, was gentleman of the chamber to Charles II., clerk of the deliveries of the ordnance in the Tower, and a bailiff in the Corporation of the Great Level. He belonged to a family of Flemish refugees, who had settled as merchants in London. In his tract he writes in favour of immigration, inclosure, and a reform of the coinage, and urges that the king should set the fashion of preferring English-made goods to foreign manufactures, which should further be discouraged by high import duties. Subsequent mercantilist writers very frequently quoted an account which Fortrey says he obtained from a "particular not long since delivered in to the king of France." This gives a detailed list of the English imports into France, and the French exports to England, making the total value of the imports from England £1,000,000, and that of the exports to England £2,600,000. Fortrey and his followers concluded that this showed that England lost £1,600,000 a year by her trade with France. The tract was reprinted in 1673, 1713, 1744, in Whitworth's *Tracts on Trade and Commerce*, 1778, and in Lord Overstone's *Select Tracts* (vol. on "Commerce") 1856.

[*Dictionary of National Biography*.] E. C.

FORTUNATO, NICOLO (living at Naples in end of 18th century), was one of those writers who, after studying carefully the evils then afflicting the kingdom of Naples, and the true sources of its wealth, pointed out the proper remedies and the way in which to put theory into practice. According to him economics are a part of philosophy, and may be divided between public economy (proper to a prince), and private (proper to families), which is limited to individuals. Fortunato dwelt on the true sources of public wealth, pointing out England as the example in this, the principles of economic science being well known there, and practised by the encouragement of agriculture, by permitting free exports of produce, by keeping the carrying trade to the national shipping, etc. He criticised the system of taxation then maintained in the kingdom of Naples, and proposed an equitable basis of custom-house duties, the abolition of internal tolls, and a uniform assessment for the taxes. He showed the necessity of a census of the population, and supported—like Gianni and Neri in Tuscany, though less fortunate than they, as they saw their ideas put into practice—the free export of corn.

FOSTER, JOHN LESLIE (*d.* 1842), grandson of Anthony Foster, lord chief baron of Ireland, was an Irish judge, and member of parliament on the Tory side for Dublin University 1807-1812, for Yarmouth, Isle of Wight, 1816, for Armagh 1818-1820, for Louth 1824, 1826. He spoke frequently (see Hansard under above years) chiefly on Irish subjects, such as Catholic Relief, Irish Grand Juries, and the Irish Insurrection Bill. He wrote an *Essay on the Principle of Commercial Exchanges, more particularly on the Relations between England and Ireland*, 1804. Through an argument against the old theory that the wealth of a nation is proportionate to the excess of its exports over its imports, in which he shows that the balance of debt is distinct from the balance of trade, he

proceeds to a discussion of the financial relations then subsisting between England and Ireland; he describes, in an original way, the loss suffered by Ireland through remittances to absentees and the interest of her debt payable in England, which caused an increase of imports and a decrease of exports; and he concludes with an argument to show that the rate of exchange does not depend on the balance of debt but on the cost of transmitting specie, and with a description of the monetary evils caused by bank restriction. The first chapter treats of the general principles governing the balance of trade, showing that foreign expenditure and other international financial relations help to produce the balance of *debt* of which the balance of *trade* forms only a part, if the larger part; that the balance of trade, whether favourable or unfavourable, can never be permanent, as the varying value of the circulating medium, which is here treated on the same footing as any other commodity, will always restore the equilibrium. The old theory that the wealth of a nation is proportionate to the excess of exports over imports is replaced by an argument to show that such excess is a loss to the nation, being the payment without return for foreign expenditure. The following proposition sums up the argument: "If the exports to all the world could be added to the amount of specie exported, they would be found equal to the amount of imports and of foreign expenditure." The rest of the essay is devoted to the financial relations of Ireland with England, and deals less with general principles than with existing facts. Ireland's foreign expenditure is shown to be a loss to her: remittances to absentees cause industry, but, the produce of this industry being exported without return, Ireland, though not being ruined, cannot accumulate capital but spends her savings on the absentees; while the raising of Irish loans in England interferes, by introducing an unnatural supply of specie into Ireland, with the natural relation between exports and imports and specie. Irish imports are increased and exports diminished in proportion to the balance of debt. The effects of bank restriction are then adversely discussed, and the rates of exchange explained as depending on the cost of transmitting specie, not, as hitherto generally believed, on the balance of debt. In the case of Ireland the rate of exchange is unfavourable, owing to English trade regulations which increase the cost of transmission, though the balance of debt is favourable. The essay closes with a detailed view of the causes of and the remedies for the excessive issue of paper money in Ireland, shows that only inconvertible paper can be issued in excess, and recommends the regulation of the issue by law. The whole essay is distinguished by clearness of style, by lucid reasoning, and by enlightened views.

[*Times*, July 13, 1842.—See M'Culloch's *Literature of Political Economy* for notice of remarks on Irish absentees.] E. G. P.

FOSTERLAND. Land set apart to provide a sustenance for a particular person or persons. [Cowel's *Interpreter*.] A. E. S.

FOTHER. See Measures and Weights.

FOUAGE, or Feuage, the French equivalent of our hearth-tax. The most famous, though not the earliest, imposition of this tax was under Charles V., when it provoked numerous revolts, and Charles was induced to abolish it on his deathbed. But the *fouage* remained a provincial impost in Brittany, and the extraordinary injustice of its assessment was the great subject of discussion at the meeting of estates of Brittany in 1788, where, according to some writers, the Revolution really began.

[For the *fouage* in Brittany, see Bertrand de Moleville, *Mémoires Particuliers*, i. p. 36.] R. L.

FOUCQUET, Nicolas (1615-1680), began public life under the auspices of Richelieu, and, after the death of the Cardinal, continued to enjoy the protection of his successor Mazarin, and was created Marquis of Belle Isle. He was successively made minister of state, superintendent of finance, and general attorney in the parliament of Paris; finally he was arrested in 1661 on a charge of embezzlement. The question of his culpability is doubtful: he had incurred the persistent aversion of Louis XIV., acting under the hostile influence of Colbert, and was sentenced to the confiscation of all his property and to perpetual banishment, which the king "commuted" into perpetual confinement. Foucquet died in 1680, after fifteen years' captivity, during which he composed several works of piety and the *Défenses de M. Foucquet* (15 vols. 1665-1667). Some of his old friends, among others La Fontaine and Madame de Sévigné, remained faithful to him until the end.

The study of his trial is interesting on account of the light it sheds on the management, and also the mismanagement, of French finance under Louis XIV.

[Chéruel, *Mémoires sur la vie publique et privée de Foucquet* 2 vols.—Pierre Clément, *Histoire de Colbert.—Nicolas Foucquet* (2 vols. 1890) by M. Lair, who has printed several unpublished documents on this subject. A very complete account, based on M. Lair's book, will be found in the *Revue des Deux Mondes* (1st and 15th December 1890).] E. Ca.

FOUNDLING HOSPITALS. These institutions illustrate the dangers of attempting to gratify charitable impulses without due regard to consequences. Foundling hospitals relieve after more or less of inquiry, and with more or less of restriction, children whose parents cannot or will not support them. Sometimes they are voluntary institutions, sometimes maintained and directed by the state, sometimes they receive only illegitimate children, as is

the case with the Foundling Hospital in London, sometimes children born in wedlock as well. Their object is threefold, viz. (1) that child-murder and exposure may be prevented, as being without excuse; (2) that a better training and education may be given to the children than would be given by the parents; (3) that a retreat may be found for the victims of seduction. What are their effects?

Malthus has pointed out the excessive mortality which the system occasions. He found that in the Maison des Enfants Trouvés at St. Petersburg, in spite of every precaution, the number of deaths was almost incredibly high. At the London Foundling Hospital, in the middle of the last century, the system was adopted of taking all comers; as a result, in a little less than four years 14,934 were received, of whom but 4400 lived to be apprenticed; and, as a further result, large numbers died whilst being carried to the hospital from every part of England by unscrupulous contractors. The same writer has shown that they infallibly give encouragement to vice. Not only do they remove one of the most powerful motives to conduct, viz. a dread of public opinion, but they also guarantee an escape from the responsibilities of paternity; thus marriage is discouraged and illicit unions are encouraged. Lastly, they help to lower wages, "by artificially increasing the number of apprentices," for "the demand for labour among the legitimate part of the society must be proportionally diminished, the difficulty of supporting a family increased, and the best encouragement to marriage removed." In answer to the argument that they diminish exposure and infanticide, Malthus remarks, "An occasional child-murder from false shame is saved at a very high price, if it can only be done by the sacrifice of some of the best and most useful feelings of the human heart, in a great part of the nation."

These criticisms on a system of foundling hospitals are borne out by a consideration of the history of these institutions in England and France. The London Foundling Hospital was established in 1741 by Captain Coram for the "maintenance and education of exposed and deserted young children." At first admission was restricted owing to want of funds, but by a resolution of parliament, 5th April 1756, the maintenance of the hospital was undertaken by the nation, and the gates were thrown open to receive all children who should be offered. On the first day 117 were admitted, in the next three years and ten months no fewer than 14,934, at the end of which time parliament withdrew its subsidy. The present practice of the hospital is to admit only illegitimate children, under one year old, who are not paupers, are the first-born of their mothers, and whose fathers are unknown or not, from whatever cause, liable for their maintenance. A total of 504 children is received, of whom the younger are put out to nurse in the country, and 330 are educated in the hospital itself.

France differs from England, fundamentally, in the fact that desertion is not an offence in that country, unless it be accompanied by injury or risk to the child. By the decree of 18th January 1811, every *arrondissement* was to contain a *hospice* for foundlings, and to every *hospice* was to be attached one of the famous *tours* for their reception. In these *tours* any child might be placed without risk of identification, and become henceforward the ward of the state. As a result, in 1833 no fewer than 136,943 children were maintained at the public expense, which led to successive acts of the legislature reducing the number of *tours*, and the facilities for desertion, till in 1858 the figure stood at 76,520. The *tours* are now abolished, but all children are received *à bureau ouvert* without restriction.

[The criticisms of Malthus may be seen in his *Principles of Population*.—The *History of the London Foundling Hospital* has been written by Brownlow (1858).—The various provisions, etc., for *Enfants Trouvés* in France are set forth in *Régime et Législation de l'Assistance Publique et Privée en France*, by Léon Béquet, *Die Armengesetzgebung Frankreichs*, by the Freiherr v. Reitzenstein (Schmoller's *Staats- und socialwissenschaftliche Forschungen*, vi. 4), and *Législation Charitable*, by A. de Watteville.] L. R. P.

FOURIER, CHARLES (1772-1837) born at Besançon, died at Paris. He was one of the best-known French socialists, the founder of the school which takes its name from him (*École fouriériste sociétaire ou phalanstérienne*). Personally he was mild and sympathetic, possessing a singularly rich vein of imagination. His father was a linen-draper, and he himself was ruined when the city of Lyons was besieged by Chalier in October 1793. He had joined, like Jacquard, the army of the Count de Precy, who defended that city against the Convention. Fourier was fortunate enough to escape the scaffold, but he had to enlist, and passed two years under the colours. Having retired from active service, he started in life afresh in 1799, at Marseilles, as a commercial traveller attached to a house of business, and after that time was never out of employment, though this might be in a very humble capacity, living in the most quiet manner, his only amusements being the dreams on which the doctrines of his school were based. Fourier's disposition was gentle and conciliatory, and though his system might call up a smile, it never provoked hostility either before or after his death. Fourier commenced thinking out his system as early as 1799, but it was not till 1808 that his first work, a single volume in 8vo, appeared, entitled *Théorie des quatre mouvements et des destinées générales* (2nd ed. 1841). This

contains what he proudly called his discovery. He sets forth in this that our planet is destined to exist for 80,000 years, of which 40,000 are occupied with ascending, and 40,000 equally with descending vibrations. The first 5000 years are occupied with the movement upwards out of chaos. They contain seven successive periods of retrogression: (*a*) the series of confusion (shadowing—happiness); (*b*) the savage state; (*c*) the patriarchal; (*d*) barbarism—of progress; (*e*) civilisation (that in which we live); (*f*) *garantisme* (a state in which we are under protection); finally (*g*) series merely sketched out (the twilight of happiness). The 35,000 years which follow are designated "the ascending harmonies." They contain nine periods: first, the series of simple combinations (the *dawn* of happiness); then seven composite ascending series; finally, one entitled "First septigenesic creation, advancing to perfection." The world will then enter (in 35,000 or 38,000 years) into the *apogee* of happiness. This is to last about 8000 years. After this the descending period (40,000 years) is to commence, which is to be passed through in an order symmetrically corresponding with the ascending period. Then the author, with a boldness of conception which disdains to indicate the course of the investigations which led him to this marvellous discovery, foresees, in an epoch comparatively nearer to our own, that is to say about 10,000 years distant, the advent of a "Northern Crown" (resembling the ring of Saturn) which, "through the influence of this crown, will usher in the disinfecting the oceans, and the perfuming them by means of the boreal fluid and an aromatic dew." This blessed result will last about 40,000 years, for the author, whose exactness is most conscientious, lets us know that all these figures respecting periods are based on the division of the whole into eighths. It is true that when the 40,000 years of the ascending period are added to the 40,000 years of the descending period, the 8000 years which form "a central or amphiharmonic period," and occupy the very centre of the existence of the earth, are omitted. It is indeed sad that this should be the case, for this period, 8000 years of perfect felicity, is the apogee of happiness.

But all will desire to know what the four Movements are which Fourier indicates. These are "the social, the animal, the organic, and the material." Ten years later Fourier perceived that he had omitted one, which he describes as "the Aromatic," that is to say, "the system of the distribution of the aromas which sway men and animals, and form the germs of winds and epidemics, governing the sexual relations of the stars, and furnishing the specific characters of the different species." It should not be forgotten that Fourier regards the stars as having a life of their own. They are born and die. The moon is a dead planet, a corpse. Our own planet, as has been seen, will live for 80,000 years (more or less, within an eighth) and then will die. Fourier explains the way the stars come into existence in a note. A star may be generated: (1) Self-generated from a simple star through its north and south poles; (2) from another star through the contrasting poles; (3) from intermediaries, as the tuberose comes into existence from three aromas (*Terre-sud*, *Herschell-nord*, and *Soleil-sud*). To return to our poor planet which has to wait 38,000 years for complete happiness. The most eminent disciples of Fourier (V. Considérant, H. Renaud, and Hennequin, for example) have not followed him in his description of the future of the universe. They have contented themselves with accepting the organisation of society heralded by their leader. What is this organisation of society? Fourier starts from the position that neither passions nor inclinations are evil in themselves. What renders them so is the medium through which they develop. In a complete condition of harmony—it is thus that Fourier designates the final end to be attained—every passion will contribute its share to the general good, a prosperity so perfect that those who are the most difficult to please will be satisfied a hundredfold. In his system there is no appeal to self-devotion, but to the most unrestrained desires, to the most unbridled passions. Men and women are to be classified in accordance with their inclinations. Fourier expects to raise work from mere drudgery, as it is under our miserable state of civilisation, to being pleasant and attractive. To attain this he would have for the motive-power, not a sense of duty, nor even self-interest, but the passions. If every one only works as his fancy and his inclinations lead him all will be well. In order to reach this result he divides the workers into series and groups, and utilises their defects. Even their vices become, when arranged in harmony, useful stimulants. It would be somewhat tedious to follow Fourier through all the details of an organisation of society which, while most original, yet unfortunately panders to the physical appetites in a manner which renders his writings sometimes of dubious propriety. He extends the idea of the family in a singular manner. Thus a woman was to be allowed several husbands—a spouse, a father to her children, and a favourite, besides mere possessors—under different titles and with different rights, but all variable, according to taste or caprice. The man also is not in these matters bound to a very strict life. According to Fourier this liberty of love is to make an end to the vice and the hypocrisy of our civilisation. But would not this condition of things be itself a state of vice? According to our socialist this would not be the case, for in the state of harmony that which is vice to us

becomes virtue, and *vice versa*. As will be seen, Fourier has treated morality in the same easy-going style that he has treated natural science.

From the point of view of an economist and an administrator, Fourier organises the *Phalange*, which was to take the place of the *Commune*. The *Phalange* has for its centre (dwelling, workshop, school, town hall, and everything else) the *Phalanstery*, in which a life in common is carried on under certain rules which recall those of our early monasteries. The workers of each phalange, divided into series, groups, or sub-groups, according to their inclinations, are to go out to work as soldiers go out to drill. The individual disappears, and is replaced by the groups. Thanks to this marvellous organisation which through its perfection foresees everything, and provides for every want, prosperity replaces poverty, cheerfulness replaces all cares and troubles, good order and morality, as interpreted by Fourier, vice and crime. The chief of each phalange is entitled the *Unarque;* three or four phalanges when united are placed under the charge of a *Duarque*, twelve phalanges under that of *Triarque*, and thus onwards to *Tetrarques*, *Pentarques*, *Exarques*, up to the *Omniarque* who governs the entire system of the phalanges (Fourier makes their number 2,985,984, neither more nor less). The omniarch is the sole ruler of our globe, and decides to live at Constantinople, which is to become the capital city of this world. He has to look after all these dignitaries, both small and great, the elected commissioners, etc. etc. The group or sub-group ought to be composed of at least nine persons; the series includes from twenty-four to thirty-two groups or sub-groups. The number of the series of each phalange is not fixed. In this happy community there are neither to be courts of justice nor judges. How could these be needed since every error or crime, as we might term it, is a useful motive power. There is to be a division of profits in each phalange, as profits are to reach the consumer by means of exchanges, and not through any authoritative distribution. Capital is to be preserved in this stage, and the profits in the phalanges to go by shares. The division was to be between capital four-twelfths, labour five-twelfths, and ability three-twelfths. But how can consumption regulate production in this medium in which there is nothing to direct any one to useful labour except his instincts, his feelings, or his passions? Fourier has omitted to inform us. One has to feel that in working through all this detail our author has never troubled himself about any crisis, whether caused by Man or Nature. All that we have stated and a vast deal more is to be found with but few exceptions in the work he wrote when launching his scheme, which bears the title of the *Théorie des quatre mouvements.*

[Fourier, however, went into more circumstantial details in other works, as *Le traité de l'association domestique agricole ou attraction industrielle*, 2 vols. 8vo, 1822; reprinted in 1841-43 in 4 volumes under the title of *Théorie de l'unité universelle*, *Le nouveau monde industriel et sociétaire* etc., 1 vol. 8vo, 1829. Two other editions have followed, the last (the 3rd) in 1848.—*Pièges et charlatanisme des sectes de Saint Simon et d'Owen*, 8vo, 1831, and finally *La fausse industrie morcelée, répugnante, mensongère, et l'antidote l'industrie naturelle, combinée, attrayante, véridique*, etc., 1835-36, 1 vol. of 840 pages. Periodical journals were also established to spread a knowledge of the societary doctrine. (1) *Le Phalanstère*, 1832-34, which became (2) *La Phalange*, 1835-1843, transformed after the death of Fourier into (3) *La démocratie pacifique.* This was the best known of all. It was suppressed by the *coup d'état* of 2nd December 1851. Fourier has been followed by many disciples both in France and in other countries, and a larger number still have adopted his ideas of social organisation. The best known of these is M. Victor Considérant, still vigorous at the age of eighty-five (written in 1893), hardy mountaineer as he is. All of Fourier's disciples have followed peaceful methods of propagating their ideas, and like their master, have lived generally respected. Attempts to establish phalansteries have been made at various times, but without success. At Condé-sur-Vesgres, and in 1832-33 at the expense of MM. Baudet-Dudlary and Devay brothers, who were disciples of the school, at Citeaux, in the buildings of the old abbey (a good choice so far). This last effort, under the guidance and at the expense of the brothers Young, was made in Algeria, l'Union du Sig, which afterwards was transformed into an ordinary business enterprise. In Texas, the colony was under the management of M. Victor Considérant. The FAMILISTÈRE (*q.v.*) at Guise borrows part of its regulations from Fourier. But these appear to be based on those laws which Fourier in his turn had borrowed from that natural organisation which political economy describes, see Ch. Gide's "Charles Fourier" in Guillaumin's *Petite Bibliothèque Écon.;* also J. S. Mill's *Principles of Pol. Econ.*, vol. i. bk. ii. chap. i. §§ 3, 4.] A. C. f.

"Communism," Professor H. Sidgwick remarks (*Principles of Pol. Econ.*, bk. iii. ch. vii.), "is generally regarded as an extreme form of socialism, in which the most thoroughgoing antagonism to the institution of private property is manifested. . . . The proposal to organise society on a communistic plan, so as to distribute the annual produce of the labour and capital of the community either in equal shares, or in shares varying not according to the deserts, but according to the needs of the recipient, is one of which the serious interest has now passed away; though a generation ago it had not a few adherents, and was supported with earnestness and ability by more than one competent writer."

FOURPENCE OR GROAT. The first English silver coin of greater value than the penny; called a groat or grosse because of its size.

Reign.	Year.	Weight grains.	Fineness.	Value.	
				In silver 925 fine at 5/6 an ounce.	In silver francs 900 fine.
				d.	franc
Edward III.	*1351*	72	925	10	·96
Henry IV.	*1412*	60	,,	8½	·80
Edward IV.	*1464*	48	,,	6¾	·64
Henry VIII.	*1527*	42·5	,,	5¾	·57
Do.	*1543*	40	,,	5¼	·53
Mary	*1553*	32	,,	4½	·43
Elizabeth	*1601*	31	,,	4¼	·41
Charles II.	*1663*	Discontinued			
Victoria	*1836*	Recommenced			
Do.	*1836*	29·09	925	4	·39
Do.	*1856*	Again discontinued			
Do.	*1888*	Struck for use in the Colony of British Guiana only			
Do.	*1891*	Special coinage bearing the inscription "British Guiana and West Indies."			
Edward VII.	*1903*				

Groats struck at the present time bear the word "Fourpence" on the reverse. The coinage of Maundy fourpences was not discontinued in 1663, but these coins have been struck each year from that date till the present time (1906). F. E. A.

FRACHETTA, Girolamo (16th century), a statesman who, writing on financial matters, in reference to the duties of a ruler, considers it incumbent on him "to maintain abundance." He argued that for this purpose the nobility should bear their share of the public burdens, contributing, proportionately to their wealth, to the taxes paid by the common people.

Il Principe, di Girolamo Frachetta, 1597, Venetia. 2ª ediz. riveduta et in molti luochi ampliata dall' autore medesimo, Venetia, 1599. 3ª ediz. 1647. A. B.

FRACTIONAL CURRENCY. In countries using metallic currency, a considerable supply of small change is required in order to carry on the daily transactions of retail trade. This want is generally met by the use of token coins, authorised by law to be received as equal to a certain fraction of the standard of value, although not actually worth so much. Such coins are usually legal tender for comparatively small sums only (*e.g.* British silver coins are not legal tender for a greater sum than 40s.), and are occasionally limited in number to so many per head of the population. Fractional coins need not necessarily be mere tokens, and, indeed, are not always such; but in view of the fact that they are only required for convenience in conducting small transactions within the country of their issue, and are not used internationally, there does not appear to be sufficient reason for losing the profit which accrues on the issue of tokens (see Billon).

F. E. A.

FRANC, History of. The origin of this name, as applied to a coin, is derived from the striking of a gold coin in 1360, on which was represented the king, John II., *the Good*, on horseback, with the legend Johannes Dei gracia Francorum Rex. These *francs à cheval*, as they were called, disappear after the middle of the 15th century. The *franc d'argent* from the first was equivalent to the *livre tournois*, and was worth twenty sous. French writers use the terms *francs* and *livres* almost without distinction, except that usage prescribed the use of *francs* only for even sums. It was possible to say either quatre francs or quatre livres, but not to say quatre francs cinq sols (now sous), the correct phrase being quatre livres cinq sols. The modern franc is the unit of the decimal coinage of France and the Latin Union.

R. L.

FRANC, Coin. The unit of value, as well as the money of account, in the countries forming the Latin monetary union is, in France, Belgium, and Switzerland, called the franc. In Italy it bears the name lire, and in Greece drachma. The franc is divided into 100 centimes, the lire into 100 centesimi, and the drachma into 100 lepta.

The franc may consist of either 4·98 grains of gold 900 fine, or 77·16 grains of silver of the same fineness; the ratio between gold and silver being thus taken at 15½ : 1.

The value of the gold franc in sterling (gold (916·6 fine at £3 : 17 : 10½ an oz.), 9·52d. That of the silver franc is in English standard silver (925 fine at 5s. 6d. an oz.) 10·32d.; but with silver at the price of 30¼d. per ounce (January 1906) the melting value of a standard silver franc is slightly less than 4·8d.

There is no *standard* French coin of the value of one franc, the silver coin bearing that name being a token composed of silver 835 fine, and of the value only of ·93 of a standard silver franc.

The smallest standard coin in gold, and the only one in silver, is of the value of five francs.

FRANCE, Bank of. See Banks.

FRANCFIEF, Droit de. This was a payment made by a Roturier (*q.v.*) on acquiring lands previously held by a noble. The payment was originally made to the immediate lord, but in the 14th century it was claimed by the crown, and henceforth forms part of the domain revenue. The *droit de francfief* was of great importance in emphasising and maintaining the rigid division of classes in France.

[De Tocqueville, *L'Ancien Régime.*] R. L.

FRANCHI, Carlo (end of 18th century), a Neapolitan lawyer. There had been much discussion in the kingdom of Naples about redeeming the *arrendamenti*—that is, the public income, which had formerly been given to the creditors of the state. This transaction—which would now be termed a conversion of the public debt—had been proposed already by Pompeo Neri in Tuscany, and steps had been taken towards it in the kingdom of Naples by the institution of a council (*Giunta per la*

ricompera degli arrendamenti, 1751), which proposed to reduce the interest to 4 per cent, or to pay off the money lent, principal and interest, with 7 per cent. The latter proposal was accepted, but many difficulties arose about the redemption of taxes; for, as the creditors had received these as their absolute property, they denied the right to take them back. Legal proceedings followed; and it was only in 1753 that the tribunal pronounced a judgment in favour of the government. During this BROGGIA proposed redemption at the current price, which was below the original one. On the other hand, Franchi strenuously defended the creditors in a memoir which Cossa thinks superior for its style to that of Broggia (*Introduzione allo studio dell' Economia Politica*, 1892, p. 251).

[*Memoria da umiliarsi a S. Maestà, in nome dei consegnatari dell' arrendamento dei Sali di Puglia*, 1750.] A. B.

FRANCHISE. (*a*) Any privilege granted by the crown to exercise a right not otherwise exercisable by a subject, *e.g.* the right to have a forest or the right of manorial jurisdiction. The most conspicuous franchise in modern times is the right to hold a market (see MARKET). Franchises are termed "incorporeal hereditaments." (*b*) The right to vote at parliamentary elections. The parliamentary franchise in the United Kingdom has been simplified by the Representation of the People Act of 1884, but is still very complicated. The great bulk of the population vote as householders or lodgers in boroughs or counties. In England a person not otherwise disqualified is entitled to be put on the register as voter in respect of the household franchise:

(1) If he has for twelve calendar months before 31st July in the year in which he claims to be placed on the list, been a resident occupier, as owner or tenant, or by virtue of any office or employment of any dwelling-house within the borough or county for which he claims a vote;
(2) If the premises so occupied have been rated to the poor rate during the time of such occupation;
(3) If the rates payable up to the preceding 5th January have been paid before 20th July of the same year.

Any person not otherwise disqualified is in England entitled to be placed on the register as a lodger if he has for twelve calendar months before the 31st July resided in lodgings in the same house within the borough or county for which he claims a vote, such lodgings being, if occupied by the claimant alone, of the yearly value of £10 (if let unfurnished), and if occupied by the claimant jointly with others, of a yearly value equal to £10 for each lodger (if let unfurnished).

The household and lodger qualifications in Scotland and Ireland are of a similar nature.

Besides this franchise which depends on residence, there is one which depends on occupation of any land or house or part of a house of a clear yearly value of not less than £10—within the borough or county. The conditions as to time of occupation and payment of rates are similar to those to which the household franchise is subject. In English and Scotch boroughs residence within seven miles of the borough is a further condition, but in counties throughout the United Kingdom and in Irish boroughs no condition as to residence is attached to the occupation franchise.

Another kind of franchise is the property franchise, which depends on the ownership of land irrespectively of occupation or residence. The land in respect of which the right is available may be freehold, copyhold, or leasehold; but as regards the last mentioned kind of property the original length of the lease must have been at least fourteen years in Ireland, nineteen years in Scotland, and twenty years in England. The conditions as to yearly value vary between £2 and £5 in the case of freeholds; between £5 and £10 in the case of long leases, and between £20 and £50 in the case of short leases. The ownership of a rent-charge does not, since 1884, entitle to a vote, and in the case of joint tenants only one is now entitled to be placed on the register. In this way two easy methods of creating faggot votes have ceased to be available.

In addition to these general franchises some special franchises exist, viz. the franchise of the freemen or burgesses in certain ancient boroughs, and the university franchise.

In all cases the franchise is confined to adult men who are British subjects. Peers and certain public officers are disqualified, as well as convicts and persons in receipt of parochial relief other than surgical or medical assistance. Persons guilty of certain offences under the Corrupt Practices Act may be disenfranchised for a period which varies according to the nature of the offence.

There are substantial reasons for the agitation for a removal of the numerous anomalies connected with the parliamentary franchise, and much can be said for the principle embodied in the maxim "one man one vote." The usual argument that the present system gives a certain preponderance to property and education which it would be undesirable to remove, is open to many objections. As regards property it will be seen that only landed property is favoured, and only such landed property as happens to be situated in districts in which the owner does not reside. As regards education it is very doubtful whether it has any advantage under the present system. Considering how long education has been compulsory, it is now time for the "illiterate voter" to be removed from the register. As a general rule men belonging

to the educated classes become householders much later in life than uneducated persons, and if they carry on any profession or business, it depends on merely accidental circumstances whether they have one vote or several votes or none at all. A barrister, not otherwise qualified, who has chambers in Lincoln's Inn and resides in Kensington, has two votes; one who resides in Richmond has only one vote; and one who during the summer months has lodgings in Richmond and during the winter months lodges in Kensington can take no part in parliamentary elections. A small tradesman may have a vote in respect of his place of business, and if he has shops in several districts, may have a number of votes, but the manager of a large joint-stock company has no similar privilege. A country banker not otherwise qualified, whose residence is within the borough in which his bank is situated, has one vote; if he lives outside the borough but less than seven miles away from it he has two, if more than seven miles one. Similar instances showing that electoral power does not depend on education may be easily multiplied, and prove that the demand for further reform is not unreasonable. But the maxim "one vote one value" is closely connected with "one man one vote" and the consideration of this would take us beyond the limits to which this notice must be confined.

The qualifications for the franchise in continental countries vary considerably. In several countries the upper house is elective as well as the lower house, and the voters for the first-named chamber are taken from a more limited sphere than those for the other house: this was the plan adopted by Mr. Gladstone in his Home Rule Bill of 1893. By the new Belgian Constitution universal franchise is recognised, but certain classes of voters are to have a larger voting power. The German Reichstag is elected by universal suffrage—every male person having attained the age of twenty-five has a vote—but in the individual German states the franchise varies. In Prussia the voters are divided into three classes according to the taxes which they pay; each class elects an equal number of electors, and a majority of the chosen electors elect the members. As the first class is naturally much less numerous than the second, and the second less numerous than the third, a considerable advantage is given to the wealthier classes.

[Anson, *Law and Custom of the Constitution*, vol. i. pp. 89-112.] E. S.

FRANCIS, JOHN (1810-1886), entered the service of the bank of England 1833, became chief accountant 1870, retired 1875. Francis was author of the works named below, which form rather anecdotic than historical contributions to the analysis of the economic "anatomy" of the middle of the 19th century. In (*a*) the writer introduces his main inquiry by a sketch of the history of interest and banking; in (*b*) he gives an outline of financial history and speculation, and describes the establishment and growth of the royal and stock exchanges; (*c*) is both historical and statistical; (*d*) includes a history of the practice of life assurance from Roman times, with some account of the origins of statistical science and of the modern application of the theory of probabilities to vital statistics.

(*a*) *History of the Bank of England; its Times and Traditions*, London, 1848.—(*b*) *Chronicles and Characters of the Stock Exchange*, London, 1849.—(*c*) *A History of the English Railway; its social Relations and Revelations*, 1820-1845, London, 1851.—(*d*) *Annals, Anecdotes, and Legends: a Chronicle of Life Assurance*, London, 1853. C. A. F.

FRANCIS, PHILIP (1740-1818). Francis, son of the translator of Horace, was born at Dublin, educated in England first by his father, and then (1753-56) at St. Paul's school; went from school to a clerkship in a government office; was private secretary to General Bligh in the expedition to Cherbourg, 1758, and secretary of the embassy to Portugal, 1760. In 1762, Townshend procured him a clerkship in the war office, and he then began his career as a political writer. *The Letters of Junius*, which appeared 1769 to 1772, are now generally acknowledged to be his. In 1773 he went to India as member of the council of Bengal, and distinguished himself by persistent opposition to Warren Hastings. Returning in 1780, he represented Yarmouth (Isle of Wight), and sided with the opposition. He took a keen interest, if not an active part, in politics, even to the latest years of his life.

If we except the few remarks in the first Letter of Junius (*To the Printer of the Public Advertiser*, 21st January 1769), on the Public Debt, and Public Lotteries, there is little or nothing of economics in the famous *Letters*. Francis appears as an economist first (*a*) in a *Letter to Sir James Steuart on the Indian Currency*, dated Calcutta, 20th November 1776, and published in vol. v. of *Steuart's Collected Works*, ed. 1805, pp. 121-133. "On the 30th August 1771, Warren Hastings ordered that rupees of the eleventh, twelfth, and fifteenth years of Shah-Alam should pass on an equality with those of the nineteenth, and that thereafter all future issues should bear this date" (Mr. F. C. Harrison in *Econ. Journal*, 1893, p. 53). Steuart had communicated his opinion on this measure to the council; and Francis defends the decision of the council. In 1810 (*b*) Francis published his *Reflections on the Abundance of Paper in Circulation, and the Scarcity of Specie*, with the motto, "*Ad tempora quibus nec vitia nostra nec remedia pati possumus perventum est.*" He writes before the report of the bullion committee (June 1810).

He describes the disease; there is hardly any gold coin in the country; it has all gone to pay our foreign creditors. Indeed there is hardly any silver coin. "There is none other than that of Birmingham for common change, and lately a few dollars. . . . They are all alike birds of passage. A lame dollar [slow to fly] will be as much a curiosity as a woodcock in August, for the dollars go just like the guineas" (p. 23). In spite of bank notes, we are falling into bankruptcy and beggary.

Where is the remedy? There is none but a change of regimen. We must stop our foreign expenses, and give up useless wars like that in defence of Portugal (26, 27), and dismiss our present ministers, under whom "peace is not to be had with honour and security" (28).

He fortifies his position by quotations from Locke, from Sir John Moore's dispatches, and from a speech of his own on "the exorbitant paper circulation," delivered in the House of Commons, 31st March 1806. "Though it has been long in print, I see no reason to suspect that anybody has hitherto perused it but myself" (p. 41). It is worth noting, that in the said speech he had quoted from his old correspondent Steuart, on French Finance (p. 42). J. B.

The work of PINTO (*q.v.*) on *Circulation and Credit* was translated in 1774 by "Rev. S. Baggs," a pseudonym for Philip Francis, who feared by using his own name to offend Lord North and the ministry, and therefore borrowed his cousin's (M'Culloch, *Catalogue of the Library of a Political Economist*, 1862, p. 280. M'Culloch's authority is Joseph Parker).

FRANKALMOIGN, or *libera eleemosyna*, was applied, not to clerical tenure in general, but to a particular kind of it. A tenant held land in frankalmoign, when he was bound to say masses for the donor and his family, but was freed from the ordinary incidents of lay tenure. Frankalmoign corresponds somewhat to lay tenure by serjeanty, and both were maintained by the statute of 1660, which abolished feudal incidents (Kenelm Digby, *Hist. of Law of Real Property*, 1884). (See FREEHOLD.) R. L.

FRANKLIN, BENJAMIN (1706-1790), was a son of Josiah Franklin, a tallow chandler of Boston, Massachusetts. He was apprenticed to the printing business at the age of thirteen, but, restless and ambitious, he sought, in 1723, against his father's will, his fortunes in Philadelphia. In 1729 he established a newspaper, and soon became a leading spirit in colonial affairs. From 1736 to 1749 he was clerk to the General Assembly; in 1737 he was appointed postmaster of Philadelphia, and in 1753 postmaster-general of the colonies. In 1754 he drew up a plan of union of the colonies, which, however, was not ratified. He was repeatedly engaged in diplomatic service, especially in France, both before and during the revolution of 1789.

Throughout his life Franklin contributed to newspapers essays on moral, philosophical, and political topics. Indolent, though fond of public affairs, he never devoted himself earnestly or persistently to any one department of knowledge, or he would undoubtedly have made a marked name in literature. On the subjects of commerce and money he displayed considerable originality. In 1729 he wrote *A Modest Inquiry into the Nature and Necessity of a Paper Currency*, in which he favoured an issue of paper money based upon land—a contribution to the land-bank controversy of the period. The security of these bills would constantly improve as the increase of population would cause the land to rise in value. This first essay was followed by many others.

Although he confused capital and money he understood quite clearly the essential uses of the latter: "Money as a currency has an additional value by so much time and labour as it saves in the exchange of commodities." When he emphasised the advantages of a paper currency he had in mind paper money which was "well founded." In the latter part of his life he opposed the bill favoured by Congress authorising the first issue of bills of credit, and afterwards urged the substitution of loans. He favoured freedom of trade, deplored the evils of the mercantile system, and declared that industry is stimulated afresh when a country has to an inconvenient degree parted with its gold and silver. In the judgment of Dugald Stewart, "the expressions *laissez-faire* and *pas trop gouverner* are indebted chiefly for their extensive circulation to the short and luminous comments of Franklin, which had so extraordinary an influence on public opinion both in the old and new world." The circulation of his views on trade and industry was largely aided by the publication of *Richard's Almanac*, beginning in 1732. He reflected with more than usual acuteness upon the laws of population, and perceived that population was limited by definite checks; see *Observations concerning the Increase of Mankind, Peopling of Countries*, etc., 1751. He was the first to estimate that the population of the American colonies doubled every twenty years. He condemned the English poor laws, and denounced any imitation of them by the colonies. In *Reflections on the Augmentation of Wages* he discriminated between cheap and low-priced labour, showing that high wages may be cheap labour.

Franklin was influenced by the writings of the French economists, which had considerable circulation in America, and in 1769 he followed the physiocratic doctrine of the unproductiveness of manufactures in *Positions to be Examined Concerning National Wealth*. His economic writings are conveniently collected in *Works of Benjamin Franklin* (Spark's ed.), Boston, 1836,

vol. ii. pp. 253-521, annotated by Willard Phillips; or may be found in the several volumes of the last and best edition (edited by J. Bigelow, New York, 1887, 10 vols.), by consulting the index. A bibliography of his numerous writings is found in *Life of Benjamin Franklin*, by John Bigelow, Philadelphia, 1874, vol. iii. pp. 491-512.

D. R. D.

FRANKPLEDGE. There being no police system among the Anglo-Saxons, its place was supplied by the *frithborh*, or mutual responsibility. Every freeman had to have a *borh*, who was responsible for producing him if he was charged of crime, and whose property could be seized if the accused failed to appear. Under the Normans this practice grew into the more highly-organised frankpledge. The whole community was divided into bodies of ten men, who were responsible for bringing to justice any of their members. The visits of the sheriff to the hundred courts to see that this system was kept up were called the view of frankpledge.

R. L.

FRAUD. English judges have always been loth to bind themselves down to any hard and fast definition of fraud, lest the restless ingenuity of the dishonest should evade the wholesome restraint of the law. Fraud may be described roughly as any deceit practised by one person on another to the prejudice or intended prejudice of the latter. If the guilty party relies on a fraudulent transaction (for instance, a fictitious sale to defraud an execution-creditor), the transaction may be set aside though no one has been actually prejudiced, but if one person sets up fraud as a ground of relief against another, he must show that he was in fact deceived and prejudiced by the fraud. It consists essentially in a false representation, or its equivalent by active concealment as opposed to a mere non-disclosure of material facts. The false representation may be made by means of conduct as well as by words, written or spoken; and it is not necessary that any particular person should be contemplated as the victim of the fraud. For instance, if two persons agree to draw and accept fictitious bills of exchange, in order to defraud the acceptors' creditors in bankruptcy, whoever they may be, the transaction is a fraud.

It was formerly thought that there was a distinction between "legal" and "moral" fraud, and that a man might be guilty of legal fraud if he made a false representation, to the detriment of some other person, without reasonable grounds for believing his representation to be true. But it is now finally settled that there is no *tertium quid* between good faith on the one hand, and bad faith or fraud on the other. It is not essential that the person making the false representation should know it to be false. A reckless false statement, made without regard to its truth or falsehood, may amount to a fraud, for if a man asserts that he knows a thing to be true without knowing whether it is true or false, he is simply telling a lie. It is of course necessary that the false statement should be believed and acted upon by the person to whose detriment it operates. A lie, known to be such, does not come within the legal scope of fraud. It is at most an attempt to defraud. It follows from what has been already said that there may be various untrue representations which do not constitute frauds. The contract of sale may be taken as affording a good illustration. First, a representation made by the seller may form part of the contract, and amount to a warranty. In that case he is held to the truth of it whether he believed it to be true or not. Secondly, the representation may be a mere expression of opinion or commendation by the seller of his wares. In that case it is inoperative, for the rule is, *simplex commendatio non obligat*. Thirdly, the representation may constitute part of the description of the thing sold. In that case the seller's knowledge is immaterial, for if the representation be not true, the parties were never at one as to the subject matter of the contract. Fourthly, the representation may be false and fraudulent. In that case, even if the representation only goes to part of the consideration, the whole transaction may be vitiated thereby.

A contract induced by fraud is voidable, not void. It is in the option of the party defrauded, when he finds out the fraud, either to affirm the transaction, holding the guilty party to the truth of his statements, and claiming compensation if necessary, or to set up the fraud. If the contract has not been performed, the party guilty of the fraud cannot enforce it. If the contract has been performed, wholly or in part, the party defrauded may still repudiate the contract, unless it has become impossible to restore the parties to the position in which they would have been if the contract had not been made, or unless the rights of innocent third parties have intervened. If restitution be impossible, the party defrauded is driven to his remedy by action for damages, in respect of the injury he has suffered. Formerly this action was known as the "action of deceit," but it is now commonly described as an action for false and fraudulent representations.

Various specific frauds are punished by the criminal law, and it is to be noted that any combination of two or more persons to defraud the public, or a third person, constitutes an indictable conspiracy.

FRAUDS, The Statute of. This statute, 29 Charles II. c. 3, is entitled in the statutes at large "an act for prevention of frauds and perjuries." It was passed in the year 1678, as

explained in the preamble, "for the prevention of many fraudulent practices, which are commonly endeavoured to be upheld by perjury and subornation of perjury." It guards against these evils by providing for certain important transactions an obligatory form consisting of a writing and signature. But a brief analysis is necessary for the proper understanding of the statute.

The statute consists of twenty-five short sections roughly drafted and arranged in a very loose order. It deals with the following subjects:—(1) contracts; (2) leases; (3) creations and assignments of trusts; (4) wills; (5) judgments.

1. *Contracts.*—The sections relating to contracts are: § 4 requires a memorandum in writing signed by the party who is to be made liable, or by the agent of such party, for any contract of the five following kinds:—

(*a*) Promise by an executor or administrator to make good out of his own estate damages recoverable out of the estate of the deceased.

(*b*) Promise amounting to guarantee or undertaking to go surety.

(*c*) Promise made upon consideration of marriage (explained not to mean a promise of marriage).

(*d*) Agreement for sale of real property or of any interest therein.

(*e*) Agreement not to be performed within the space of a year from the making thereof.

§ 17 requires for a contract for the sale of goods for the price of £10 or upwards, either

(*a*) part acceptance of goods sold, or

(*b*) payment of earnest or part payment of price, or

(*c*) a memorandum in writing made and signed by *both* parties to the contract or by their agents.

Lord Justice Brett in the case of Britain *v.* Rossiter, and Lord Blackburn in the case of Maddison *v.* Alderson, have laid down that the effect of failure to comply with the provisions of either of these sections, in a case to which they are applicable, is not to prevent the formation of a contract, but to render proof of the contract inadmissible. But these sections cannot be correctly understood without reference to text-books on contract, and to the reported cases, amounting to many hundreds, which elucidate them. Their utility has been the subject of the most contradictory opinions by experts. Their intent was to ensure proper evidence of important contracts. The objections to these sections are briefly as follows:—

(*a*) "Restrictions on contracts so wide and general as are prescribed by this act are peculiar to the English law and the American, which has derived them from the English" (Leake, *Papers of Juridical Society*, vol. i. No. 14).

(*b*) As the existence of these restrictions is not generally known to men of business, the statute has introduced insecurity into business transactions. Thus a verbal contract for the sale of goods over the value of £10, where there has not been part payment of the price or part acceptance of the goods, cannot be enforced because of the statute, although of frequent occurrence in business. Although it has hindered the perpetration of fraud through a feigned contract established by perjury, it has enabled dishonest men to elude agreements which they were morally bound to keep.

(*c*) The evils against which these sections were originally directed have been much lessened since parties were allowed to be witnesses in their own causes. (See 14 & 15 Vict. c. 99, § 2, etc.)

(*d*) These sections being roughly drafted have "introduced great confusion and uncertainty into the law of contract," so that "it is universally admitted that no enactment of any legislature ever became the subject of so much litigation" (Leake).

The 17th section appears to have fallen practically into disuse. Mr. Justice Stephen says that he has hardly ever been called upon to decide a case under it, and is informed that in some large towns mercantile men repudiate it in practice.

2. *Leases.*—The sections relating to leases are §§ 1, 2, and 3. They require (*a*) that every lease shall be in writing signed by the parties or their agents, except leases not exceeding the term of three years, and in which the rent reserved to the landlord amounts to at least two-thirds of the full improved value of the property demised. A lease which fails to comply with this requirement creates only a tenancy at will.

(*b*) That every assignment, grant, or surrender of a leasehold interest shall be in writing signed by the parties or their agents.

In cases where the statute of frauds requires a writing for the creation or assignment of a leasehold interest, the Act 8 & 9 Vict. c. 106 requires a deed. But a lease invalid for non-compliance with these statutes may yet be valid as an agreement to grant a lease. Such agreements come under the provision of § 4 respecting agreements for the sale of interests in land.

(3) *Creations and Assignments of Trusts.*—The sections relating to trusts are—

§ 7 requires that every creation of a trust in real estate shall be proved by some writing signed by the party creating the trust or by his last will in writing.

§ 8 excepts from the operation of the statute trusts arising not from the act of any party, but from an implication of law in case of certain transactions.

§ 9 requires that every assignment of a trust, not in real estate only, shall be in writing

signed by the party assigning, or by his last will in writing.

§§ 10 and 11 enact that real estate held upon trust for any person shall be regarded as forming part of that person's assets both in his own hands and in those of his heir.

These sections continue in force, but have not occasioned much criticism.

4. *Wills.*—The sections relating to wills are no longer in force. They provided as follows:—

§ 5 required every will of real estate to be in writing signed by the testator or by some other person in his presence, and by his express direction, and attested and subscribed by three or four credible witnesses.

§ 6 provided that no will of real estate should be revoked otherwise than by (*a*) a subsequent will or codicil or some other writing executed as above, or by (*b*) burning, tearing, or obliterating by the testator, or in his presence by his direction.

§§ 19, 20, 21 imposed restrictions on the validity of nuncupative wills (wills made by word of mouth).

§ 22 rendered null and void the alteration, by word of mouth only, of a written will of personal property.

§ 23 made an exception for the nuncupative will of a soldier on service or sailor at sea.

§§ 24 and 25 do not call for notice here.

The above were the first enactments which imposed an obligatory form upon wills. The objections to such a requirement made in the case of contracts certainly do not apply in the case of wills. But this part of the statute of frauds has been wholly superseded by the Wills Act, 1 Vict. c. 26, which requires every will other than that of a soldier on service or a sailor at sea to be in writing signed by the testator and attested by two witnesses, and requires for the revocation of a will either a writing executed with these forms or the destroying of the will by the testator or in his presence and by his direction.

5. *Judgments.*—The sections relating to judgments—

§§ 13, 14, 15 provide that a judgment as against purchasers, *bona fide*, of real estate, liable under the judgment, shall take effect only from the time when the judgment is signed. Formerly judgments had taken effect as against such purchasers from the first day of the term wherein they were entered, or some other time prior to the one thus fixed. Now no judgment affects any land until such land shall have been actually delivered in execution in pursuance of the judgment, 27 & 28 Vict. c. 112.

§ 16 provides that a writ of execution against goods shall take effect only from the time when the writ is delivered to the sheriff for execution. Formerly such writs took effect against such purchasers from the first day of the term in which they were issued. Now they do not take effect until the goods have been actually seized, 19 & 20 Vict. c. 97.

[For further information respecting the statute of frauds, consult text of statute and the following authorities:—Pollock, *Principles of Contract.*—Leake, *Digest of the Law of Contract.*—Williams on *Personal Property;* Williams on *Real Property*, and the cases referred to in these works. For general criticism of the statute consult No. 14 in the first volume of *Papers of the Juridical Society* (by Mr. Leake), and an article on "Section Seventeen of the Statute of Frauds," contributed by Mr. Justice Stephen and Sir Frederick Pollock to the *Law Quarterly Review*, January 1885.] F. C. M.

FRAUDULENT CONVEYANCE. These words are generally used with reference to conveyances pronounced to be void by the statutes 13 Elizabeth c. 5, and 27 Elizabeth c. 4. The first-named act avoids, as against *creditors*, all conveyances of landed estates and goods for the purpose of "delaying, hindering, or defrauding" such creditors, unless made on valuable consideration to any person not having any notice of such fraud. As the Bankruptcy Act 1883, subjects all voluntary settlements within ten years of a bankruptcy to the possibility of being declared void, it is seldom necessary to have recourse to the act of Elizabeth, but this may be necessary in cases where property has been given away by an insolvent debtor without being settled, or when the voluntary conveyance was more than ten years old at the date of the bankruptcy. The act of the 27th year of Elizabeth is applicable to *real* property only, and was intended to meet the case of a vendor who, previously to conveying land to a purchaser for value, had fraudulently conveyed it to another person, who by virtue of his priority had acquired the whole property; but judicial interpretation has extended its scope, and until 1893 all voluntary conveyances of land were void as between the original donee and a subsequent purchaser for value. The Voluntary Conveyances Act of 1893 has repealed this extension of the act of Elizabeth, and the operation of the act will in future be confined to such voluntary conveyances as are fraudulent in the real sense of the word. E. S.

FRAUDULENT PREFERENCE (IN BANKRUPTCY). The main object of the bankruptcy laws is to secure the equal distribution of the debtor's assets amongst his various creditors. From the time when the trustee's title accrues, the debtor is no longer free to select the order in which he will pay his debts. Under § 43 of the Bankruptcy Act 1883, the title of the trustee relates back to the earliest act of bankruptcy within three months of the petition, and this provision is supplemented by § 48, which enacts that "every conveyance or transfer of property or charge thereon made, every obligation incurred, every payment made,

and every judicial proceeding taken or suffered by any person unable to pay his debts as they become due from his own money, in favour of any creditor, or in trust for any creditor, *with a view of giving such creditor a preference over the other creditors*" shall, if the debtor be adjudged bankrupt on a petition presented within three months of the date of the transaction in question, be deemed fraudulent and void as against the trustee. Under the act of 1869 the transaction was protected if the creditor acted in good faith and without notice of any act of bankruptcy. The present act disallows the exception. The only question for consideration is the motive of the debtor in making the transfer or payment.

Fraudulent preference in bankruptcy must be distinguished from fraudulent conveyance under the statute 13 Elizabeth, c. 5. The act of Elizabeth operates whether there be a bankruptcy or not,—it contains no provision as to time, and its general scope is somewhat different. It strikes at collusive transactions by which creditors may be defeated or delayed, but does not prohibit the honest preference of one creditor over another. M. D. C.

FREE BANKING is the term applied in the United States to a system under which (1) banking powers are granted to all applicants under certain prescribed conditions, and (2) bank-notes issued under such authority are protected by a deposit of security held by the government which establishes the system. The earlier banks in the United States, whether established by congress or by the state legislatures, were organised under special charters. Various expedients were resorted to for the prevention of unsound issues, with various degrees of success, but without arriving at any generally acceptable method. The suspension of specie payments in May 1837, and the extraordinary confusion of the paper currency which ensued, finally brought the general discontent to a climax in New York, and the legislature of that state, in June 1838, passed an act for the free organisation of banks issuing a secured currency. Under this act, as amended and revised, any group of persons proposing to form a banking association, and contributing a capital in no case less than $25,000, say £5000, can be incorporated with full banking powers, subject to uniform regulations as to the conduct of their business, its supervision by the state, and their corporate liabilities and duties. Individual bankers and firms, who use the name "bank," are also required to conform to the system, although they may remain unincorporated. The right of issue is given to any association or individual coming under the system. The notes are prepared and registered by a public officer, are delivered to the issuing bank only after the deposit of security of a prescribed kind and amount, and must be signed by the officers of the bank before issue. Banks organised upon such a system are called free banks.

Free banking does not imply, then, an unrestricted management of the business, or complete liberty in the issue of notes. Such a system is called free because the right to organise, upon compliance with fixed conditions, is extended to all, free from any requirement of special legislation. It is not essential that there should be any engagement by the state to make the notes good, if the security, of which the state is trustee, proves insufficient. Neither does the deposit of security for the ultimate payment of the notes answer the question as to proper provision for daily redemption. As the provision for secured notes gave promise of insuring the ultimate solvency of bank notes, it settled the one banking question as to which the public were most sensitive, and enabled the legislature to renounce the task of deciding upon applications for special charters. The system adopted by New York was copied by many other states before the civil war, but in some cases with relaxations which impaired its safety. In 1861 the New York free banks, having on deposit stocks of the United States and other solid securities, met the strain of war with success. In several states, where the law was less rigid, many free banks went down, and their notes, secured in some cases chiefly by bonds of seceded states and others in low credit, caused heavy losses to the holders. Two years later congress adopted the free banking system on a great scale, by a law providing for national banks, to be organised on application under a general act, and to issue notes with United States bonds as the only admissible security. In 1865 congress laid a tax of ten per cent on all bank notes other than national, thus excluding from the field all issues authorised by the states. Several of the states, however, still retain their laws as to circulation, although these have been entirely dormant since 1866. Free banking under the national system was for some years seriously limited, by the provision that the aggregate of notes issued by all the national banks should not exceed $300,000,000, afterwards $354,000,000 (say £60,000,000, and £70,800,000) although the organisation of banks was still free to all. The act of 1875, for resuming specie payments, removed the limit of aggregate circulation, and thus completely established free banking under the national government. The rapid rise in price of United States bonds, and the low return yielded by an investment in them, have since put a new check upon the system; and if the use of bank-notes is to continue, the alternative may soon be presented, of either finding for deposit by national banks some other security than United States bonds, or removing the prohibitory tax upon issues authorised by the states. In the

latter case free banking would be likely to be adopted by the states more widely than before, and with provisions exhibiting great variety of detail, unless some arrangement should be devised for the regulation of local issues by national authority upon a common plan.

FREE BENCH. A widow's dower out of lands held by customary tenure for customary estates of inheritance. It is generally one-third for life, but varies from a portion of the profits to the whole inheritance. The right to free bench does not arise until the death of the husband, and therefore it only affects land of which he was donor at the time of his death (Challis, on *Real Property*, London, 1885).

J. E. C. M.

FREE COINAGE. In its fullest sense a right enjoyed by all persons to bring gold or silver bullion, or both, to a mint and to receive it back in the form of coin, no deduction being made to defray the expenses of manufacture, alloy metal, etc. The conversion at a mint of bullion belonging to a private holder into coin at a low fixed charge, as in Austria, may however be considered *free* when compared with such a system as that in force in this country in regard to the silver currency. For in this latter case the government purchases bullion at the market price, always issuing it at a circulating value of 5s. 6d. per troy ounce of standard metal.

In this country until towards the end of the 17th century, any person was permitted to bring bullion, both gold and silver, to the mint and receive it back in the form of coin, less a certain deduction which was paid to the king as a SEIGNORAGE (*q.v.*), or was employed to defray the expenses of the mint, see BRASSAGE. In 1666 perfect freedom of coinage for both metals was established. An "Act for encouraging of Coynage" (18 Chas. II. c. v.) was passed whereby it was enacted that "Whatsoever person or persons, Native or Foreigner, Alien or Stranger, shall from and after the twentieth day of December, one thousand six hundred sixty and six, bring any Foreign Coyn, Plate or Bullion of Gold or Silver, in Mass, Molten or Allayed, or any sort of Manufacture of Gold or Silver into His Majesties Mint or Mints within the Kingdom of England, to be there melted down and Coyned into the current Coyns of this Kingdom, shall have the same there Assayed, Melted down and Coyned with all convenient speed, without any defalcation, diminution, or charge for the Assaying Coynage or waste in Coynage." This important change was proposed in consequence of the great scarcity of currency owing to the common practice of melting and exporting coins, and the act was to remain in force for a period of seven years only. It was, however, renewed at seven-year intervals without intermission until 1768, and then made perpetual. The continuing acts make frequent reference to the desirability of renewing the grant to the king of rates, duties, and impositions "upon the importation of Wines, Vinegar, Cyder, Beer, Brandy, and Strong Waters," which were set aside for the maintenance of the mints, lest "this Kingdom be deprived for the future of so great a good as it hath for so many years last past enjoyed." It is clear, from the currency literature of the period, especially that published towards the end of the 17th century, that this latter opinion was far from being universally held. Sir Dudley NORTH, for example, writes in 1691, in reference to the melting of newly-coined money by private persons, "Thus the Nation hath been abused and made to pay for the twisting of Straw for Asses to eat," and the imposition of a charge sufficient to defray the expenses of the mint has been advocated by Adam SMITH, J. S. MILL, RICARDO, and many other economists of note.

The free coinage of silver was suspended in 1798, in consequence of the low price of bullion, and finally abolished in 1816, when our present currency was introduced, although the right was then reserved to the king to authorise the receipt of silver for coinage at the mint, subject to a deduction on account of seignorage of 4s. from every pound weight of sixty-six shillings. This right has, however, never been exercised.

When in 1869 the chancellor of the exchequer, Mr. Lowe, afterwards Lord Sherbrooke, proposed to meet the expenses of coinage by deducting one grain of gold from the weight of each sovereign issued, the subject of free coinage was exhaustively discussed in parliament and the press, and it is curious to note that, whereas two centuries previously free coinage had been adopted "for the encouragement of the bringing of Gold and Silver into the Realm," the main argument urged against Mr. Lowe's proposal was that it would have a disastrous effect on British commerce by interfering with the free use of the sovereign in commercial transactions abroad.

In no other country is the coinage of gold as absolutely free as it is in England, but in the United States all charges have been abolished since 1875, except that for the alloying metal. In France, and the other States forming the "Latin" Union, the charge imposed amounts to 6·70 fr. per kilog. of gold of standard 900 (value 3,100 fr.) or 0·216 per cent; in Germany the charge is 6 marks for coining 1 kilog. of

gold, that is 0·215 per cent, or nearly the same as in France.

Free coinage of silver, even in the more restricted sense, has now been generally abolished. Up to June, 1893, silver was coined for private persons at the Indian mints at a charge of 2·1 per cent, but this liberty was then withdrawn. No European State undertakes the coinage of silver except on government account, and the same is the case in the United States, where the law requiring the purchase by the government of a definite quantity of the metal has now been repealed. In Mexico the export of uncoined silver bullion is prohibited; all silver intended for export must, therefore, pass through one of the mints, where a coinage charge amounting to $4\frac{3}{4}$ per cent is imposed. Most of the Central and South American states impose a charge for the coinage of silver, which amounts, in Peru, to as much as 9·86 per cent.

[*Report of the Royal Commission on International Coinage*, 1868, p. 320.—*The Times* and other newspapers, Aug. to Oct. 1869.—S. Dana Horton, *The Silver Pound*, 1887.—Lord Liverpool's *Letter to the King on the Coins of the Realm*, 1805.—*The Gold Coinage Controversy*, 1869 (privately printed by the Bank of England).—"Seigneurage and Mint Charges," by J. B. Martin, *Journ. Inst. Bankers*, vol. v. (1884), p. 171.] E. R.

The Bank of England is bound by law to purchase at the rate of £3 : 17 : 9 an ounce any gold bullion of the legal standard brought to it by the public for sale. Private persons may likewise bring bullion to the mint, and receive back the full amount (at £3 : 17 : $10\frac{1}{2}$ an ounce) converted into coin, free of any charge for loss or manufacture; but as there may be considerable delay, the public prefer to sell their bullion to the bank and receive their value at once (see article on Mint, *Ency. Brit.*, 9th ed., vol. xvi. p. 485). The payment to the bank thus does not represent any charge on the coinage, but only remuneration for trouble and loss of time.

FREEDOM IN THE MIDDLE AGES. Though there was not an absolutely fixed line in the middle ages between those who were possessed of freedom, and those who were not, yet the division between these two classes was for many purposes very distinctly marked. The following article on the FREEDOM OF THE CITY OF LONDON will serve as an example of the rights and privileges conferred by obtaining freedom in a city. For other branches of the subject see articles on ENFRANCHISEMENT, FREEMAN, FREE TOWNS, SERF, SERFDOM, SERVITUDE, and VILLEIN.

FREEDOM OF THE CITY OF LONDON. The right to share in the duties and privileges of citizenship in London seems in the earliest times to have been extended to all holders of tenements, who were in SCOT AND LOT (*q.v.*), and who were therefore called upon to contribute to common civic burdens and to fill leet offices. Even to-day "inhabitancy as a householder is still termed the common law qualification of burghers, and the scot and lot householder, when admitted a freeman, remains the only true and efficient citizen for *all* civic purposes" (Norton, *Commentaries*, pp. 100, 101), although others have in later times been admitted with certain qualifications to the enjoyment of some of his rights. After the grant of a corporation, *temp.* Richard I. (1189-1199), *enrolment* into the civic freedom was required of all freemen. Norton suggests that this step was taken "very soon after, if not immediately upon, the foundation of the corporation itself," and that enrolment took place in the hustings court, urging that such admissions are referred to as common in the reigns of Edward I. (1272-1307) and Edward II. (1307-1327). It would seem, however, that the practice of enrolment can be definitely traced to the year 1275, when it was provided that the names of apprentices and of all who wished to buy the freedom should be inscribed "in papirio camere gildaulæ" (Brit. Mus. *Cott. MSS., Otho*, B iii. transcribed in *Add. MSS.*, 5444, f. 90; Brandon, *Inquiry into the Freedom of the City of London*, p. 15). In that same year the methods of acquiring the freedom would seem to correspond to those in vogue to-day. It is stated in the MS. above quoted that there are three ways, (1) by birth; (2) by apprenticeship, and that for a term of not less than seven years—an interesting and possibly the earliest notice of this custom of London; (3) by taking it up "before the mayor and other aldermen in the chamber of the city." In Edward II.'s reign a mercantile qualification becomes an important feature. By a charter of 12 Edw. II. inhabitants and others, being of any certain mystery or trade, might be admitted into the freedom only "by surety of six honest and sufficient men of the mystery or trade that he shall be of, who is so to be admitted," and that in the hustings courts. If, however, they were strangers and not of some certain mystery, they could not be admitted into the freedom without the assent of the commonalty; "saving always, that concerning apprentices the ancient manner and form of the said city be observed" (Cp. Birch, *Hist. Charters*, p. 47). Somewhat later it was ordained that no one should be admitted into the freedom of the city, unless the wardens of a company gave their consent and certified that he was a member of their body (Brandon, p. 19, quoting *Liber Dunthorne*, f. 101 b). This restriction remained in force until by a resolution of common council, 17th March 1835, it was decided to confer freedom on certain terms through the city chamberlain irrespective of the great trading companies (Minutes of Common Council, 17th March 1835).

(1) The most ordinary form of acquiring

freedom was by serving an apprenticeship to a freeman, free both of a company and of the city, until an act of common council (9th March 1836) sanctioned the binding of apprentices to freemen of the City who had not taken up the freedom of any company (Minutes). The term of service in London was for seven years until 1889, when it was reduced to four years (Act of Common Council, 14th March 1889). While, however, apprenticeship for a varying term of years (until 5 Eliz. c. 4, fixed the minimum at seven)—came in most English towns to be the one method by which citizenship was acquired, in London, although very usual, it never became the sole qualification.

(2) Freedom by patrimony has, as shown above, conferred civic freedom from early times; all children male and female of a freeman born after his admission can claim their freedom at the age of twenty-one years.

(3) Freedom by redemption or purchase. This is possible (*a*) where the apprenticeship indentures have, for some good reason, been only imperfectly executed; (*b*) where persons, not aliens, are admitted by grace and favour; (*c*) where the presentment is by the chamberlain, or some person entitled by grant to confer freedom (Reports, 1837, xxv. p. 61). The commission on municipal corporations issued a report in 1835 which excluded London, a subject which was dealt with in a special report issued in 1837. In this the important resolution and the act of common council (17th March 1835; 9th March 1836) are left out of account, and an additional case of freedom by redemption is quoted as possible, though not very common; (*d*) this was where an individual, entitled to admission through one company, desired to be admitted through another. The majority of cases by redemption are simple purchases, the buyers being presented to the Court of Aldermen and admitted upon the payment of certain fees (Pulling, *Customs*, p. 64), though the consent of the Court of Common Council is required in the case of aliens. And to-day, practically any one can buy the freedom, although such a purchase does not confer *all* the privileges of citizenship (*City of London Directory*, 1893).

Females may obtain the freedom by patrimony or by apprenticeship, taking an oath, similar to that of a freeman, as a "free sister." As such they may take male apprentices and enjoy various privileges, though these are suspended by marriage. Widows of freemen are deemed *free by courtesy* during the period of widowhood (Reports, 1837, xxv. 61, 63).

The fines payable on admission seem to have been very arbitrary, and to have varied considerably at different times, the exact sum being fixed at the discretion of the aldermen and chamberlain (Brandon, p. 20).

From early times exceptional privileges have been granted by the crown to the citizens of London in a series of charters, while ancient customs have been confirmed or amended by city ordinances (Charter, 15 Edw. III.; Norton, p. 364); in case of necessity these are recorded "by the mouth of the recorder" before the king's justices without the intervention of a jury (Charter, 2 Edw. IV.; Birch, p. 76). For a detailed account of the privileges, careful examination of many documents is essential, and it may be sufficient to indicate such as are noticed by the chief authorities on the subject, and which have dealt with the trade and government of the city. The right to engage in retail trade could be enjoyed by all freemen whether resident or not, and by them alone, until an act of common council in 1856 admitted all, whether free of the city or not, to retail trade. On the question of wholesale trade there has been much difference of opinion. It would seem that though strangers, *i.e.* non-freemen, might engage in wholesale trade, they might deal only with freemen and not with other strangers; the commissioners of 1837 stated however that, though not enforced, wholesale trading should, strictly speaking, be limited to freemen. Freemen have always been held exempt from all tolls and customs held by the crown throughout the country when Henry I.'s charter was granted, non-resident freemen being merely free from city tolls and port dues. They were free from impressment as soldiers or sailors (Charter, 15 Edw. II.), nor could they be forced to plead without the city. The right to share in the government of the city, directly or indirectly, has also from early times been restricted to freemen; they alone can enjoy appointments in the gift of the common council, though this rule is suspended in the case of barristers (Reports, 1837, xxv. 38); and the highest civic officials, *e.g.* lord mayor, sheriffs, etc., even to-day must be liverymen of some company. For centuries the freemen paying scot and bearing lot elected the members of the common council, the aldermen, and ward officers, until, indeed, by 30 Vict. c. 1, the right was extended to occupiers and lodgers who were not freemen of the corporation (Norton, pp. 244, 251). By a civic ordinance of 49 Edw. III., the trading companies were empowered to nominate a certain number of freemen to vote in the elections of lord mayor, sheriffs, corporation officials, and parliamentary representatives, and from these the mayor selected the voters (Norton, p. 245). But by ordinance of 15 Edw. IV. the nomination was left entirely in the hands of the companies, the members of which, then and for long afterwards, were all traders and therefore almost necessarily householders. They were directed to send some of their more important members to take part in elections, attired in a distinctive dress or livery. And from this dates the appearance of the livery men as a superior class within the companies,

to whom was entrusted the elective franchise in the common hall; this they exercised until 11 Geo. II. c. 18 extended it to liverymen, free of the city, but not necessarily residents (Norton, 107). And this remains to-day the qualification of electors to corporate offices in common hall (*ib.* 251); the number of liverymen thus qualified was 7603 in 1893 (*City of London Directory*, 198). The various reform bills of this century have extended the parliamentary franchise to others than freemen, although a liveryman and freeman of London by birth or servitude, and residing within twenty-five miles, can still claim a vote.

The right to benefit by certain charities, and of appointment to certain civic offices, and to the election of certain municipal and parliamentary representatives, are perhaps the most obvious and the most important of those which may be enjoyed by freemen and liverymen to-day, although the ancient "custom" still holds good where it has not been expressly given up.

FREE ENTERPRISE. See LAISSEZ-FAIRE.

FREEHOLD, HISTORICAL. The term "freehold" we owe to the mediæval law of real property. It is used to describe such tenures as were considered worthy of a freeman. According to the theory of feudalism the political and civil rights of the individual depended on his relation to the land. In a feudal society developed according to strict logic the freeholder alone would have been a freeman, and only the freeman would have been a freeholder. But in no European country, least of all in England, was the feudal principle worked out to all its logical consequences. Only the freeman could be a freeholder. But even in the feudal period freemen frequently held land by tenures other than freehold, by tenures technically regarded as base or servile.

The term "freehold" appears to have come into use about the end of the eleventh or the beginning of the twelfth century. "Some time before the reign of Henry II., but apparently not so early as Domesday, the expression *liberum tenementum* was introduced to designate land held by a freeman by a free tenure" (Kenelm Digby, *History of the Law of Real Property*, p. 49). But the thing had been developed long before the name had been found for it.

Some characteristics are common to all freehold tenures. (1) The indefinite duration of the freeholder's interest in his land. An estate to a man for his life (a life estate), an estate to a man and his descendants (estate tail), an estate to a man and his heirs (fee simple estate) are all freehold estates. They are likely to differ much in point of duration. But they are all alike in this that the moment of determination is uncertain. A lease of land for 999 years does not give a freehold estate to the lessee. It is not likely that this consideration would have led any free man to prefer an estate for life to an estate for 999 years. But when the theory of freehold tenures grew up, long leases were unknown and leases of whatever duration were uncommon. (2) The obligation of fealty. The freehold tenant did homage to the lord for his land and took an oath of fealty. (3) The liability to forfeiture and escheat. Upon the tenant's failure to perform any of the conditions on which he received his land, he incurred the penalty of forfeiture and his land might be resumed by the lord. Upon the failure of the tenant's line either for want of heirs or through corruption of blood consequent upon his conviction for felony the land reverted to the lord in virtue of his right of escheat (see FORFEITURE). (4) Suit of court. The tenant was bound to appear as an assessor in the lord's feudal court of justice, and for some purposes to submit himself to the jurisdiction of that court.

In general the services which the various classes of freehold tenants had to render to their lords were only such as appeared consistent with the dignity of a free man. But they differed so much in character that they must be considered separately with reference to each species of freehold tenure.

I. Tenure by chivalry or by knight service. On this tenure land was held by the military tenants of the crown and also by the military tenants of earls and barons. Its distinguishing characteristic was the obligation to render military service, if called upon, for forty days in each year, with a number of fully-armed horsemen proportioned to the size of the estate. From the time of Henry II. onwards this obligation was frequently commuted for a money payment known as scutage (shield-money). But this tenure involved other burthensome obligations. The principal were as follows:—

(*a*) The liability to aids or payments made to the lord upon certain important occasions, the knighting of his eldest son, the marriage of his eldest daughter, or the ransoming of his person from captivity. (*b*) The liability to reliefs or payments made to the lord by the heirs of deceased tenants upon coming into

their estates. (*c*) Wardship or the right of the lord to administer the estate during the minority of his tenant without having to render any account when the tenant came of age. (*d*) Marriage, or the right of the lord to choose a husband for a female tenant who was his ward, and to receive a payment from the favoured suitor. Those burthens were regulated by Magna Charta in the year 1215. But they remained so onerous that under James I. it was proposed to commute them for a permanent revenue to be settled on the crown. Under Charles II. they were so commuted by the act for the abolition of military tenures (12 Car. ii. c. 24).

II. Tenure by grand sergeantry. On this tenure land was held direct from the crown for service rendered in person to the king, such as carrying the royal banner when he went to war. This tenure still exists, but is extremely rare and of no consequence save as a legal curiosity.

III. Tenure by free or common socage. The etymology of the term "socage" is doubtful. It has been derived from an English word "soc," a privilege, as in the phrase "sac and soc," and from a French word "soc," meaning a ploughshare. "Sochemanni" form one class of the population as enumerated in Domesday Book, and are probably the representatives of the class of free landed proprietors other than thegns or churchmen previous to the Norman Conquest. Persons holding land by socage tenure were free from some of the most oppressive burthens incidental to military tenure. They owed no military service for their land although they were liable, as were all freemen, to serve in the national militia when necessary. They were accordingly exempt from scutage, the money payment in lieu of military service. They were exempt from the annoyances incidental to wardship and marriage. For the lawful guardian of a minor holding land by this tenure was not his lord, but the nearest of kin not capable of inheriting the land. And such a guardian was not allowed to make any profit by the marriage of his ward. The tenant in socage was obliged to make certain money payments, aids, reliefs, rent, etc., or to render his lord certain agricultural services strictly defined beforehand. On account of the advantageous character of socage tenure it was provided by the act 12 Car. ii. c. 24, that all land formerly held on military tenure should thenceforwards be held on socage tenure. Thus by far the greater part of the land of England is now held in socage. In the course of time the burthens of socage tenure have become almost nominal. For by the statute *Quia Emptores* of 1290 (18 Ed. I. c. 1) sub-infeudation was forbidden. Thenceforwards any person taking a transfer of freehold lands stepped into the place of his predecessor and became liable only to those obligations to which his predecessor had been liable. Thus the freeholder of to-day has to make only such feudal payments for his land as had been settled before the year 1290 and these have become nominal in consequence of the fall in the value of money and the rise in the value of land. As society became more settled the lord lost his motive for exacting the oath of fealty, which has long since become obsolete. The feudal courts having dwindled to mere forms, the obligation to suit and service now means nothing. Corruption of blood and escheat of lands upon the tenant's conviction for felony are no longer enforced by law. The enlarged power of testamentary disposition has made escheat for lack of heirs to the tenant a very rare occurrence. Finally, the rights of the lord having lost all their value have in many cases been allowed to fall into utter desuetude. The record of them has frequently perished. Thus many freeholders cannot be shown to have any lord under the crown, and the freeholder has come to regard himself, and is regarded by others, as full proprietor of his land.

Socage tenure, being a product of customary law, has sometimes assumed peculiar forms. In one form, known as petty sergeantry, the tenant held his land of the king on condition of rendering him every year some object of use in war, such as a pair of gilt spurs. Other forms, known as burgage tenure and gavelkind tenure, are distinguished by peculiar rules of succession, when the tenant dies intestate (see DESCENT OF PROPERTY).

It remains to mention a free tenure of land so distinct from those which have been mentioned as hardly to admit of being classed with them. This is FRANKALMOIGN or free alms (Lat. *libera eleemosyna*). On this tenure land was and is held by ecclesiastical corporations. The service rendered for land thus held was spiritual, consisting simply in prayer and performance of the rites of religion. The holders paid no rent in money or in kind. They were not subject to aids or reliefs. They were not subject (being corporations and therefore immortal) to escheat or forfeiture. They were not capable of military service. Thus their tenure approached more nearly than any other tenure recognised by English law to a full ownership.

F. C. M.

FREEHOLD, LEGAL. A freehold tenure of land meant formerly a tenure which obliged the tenant only to such services as were worthy of a freeman (see FREEHOLD, HISTORI-

CAL). In course of time these services have either wholly disappeared or have become insignificant. A quit-rent of nominal amount is still payable in some cases to the lord of the manor, and when an heir succeeds to the freehold he has to pay a relief amounting to one year's value of this quit-rent. Where a manor is still existent the freeholder is still bound to attend the court baron held by the lord. But the court baron is practically never held. An oath of fealty to the lord, where there is a lord, is still due in theory but in practice is never exacted. In short the freeholder has practically the full enjoyment of his land unencumbered by any real duties towards a lord. He therefore approaches much more nearly than a leaseholder or a copyholder to the character of an absolute owner.

But the interest of a freeholder in his land differs in extent accordingly; as it is (1) an estate for life; (2) an estate in tail; (3) an estate in fee simple. (For the nature and peculiarities of these different estates, see ESTATE.) If a man have an estate in tail or in fee simple, he has an interest in the land which extends beyond his own life. This interest descends to his heirs according to the peculiar rules governing the devolution of real estate (see DESCENT OF PROPERTY). In many cases a family settlement (see ESTATE) provides for the creation of life estates or estates tail in remainder, which come into possession as the preceding life estate or estate tail expires. But the power of thus controlling the devolution of the land is restricted by law (see PERPETUITIES).

Owing to the gradual enfranchisement of copyhold land (see COPYHOLD), an increasing proportion of the land of England is held as freehold, and at no distant date the whole will be so held (see also LEASEHOLD). F. C. M.

FREE LIST is a term arising out of the prevalence of unwieldy tariffs of import duties in foreign countries and many British colonies. It denotes the schedule of commodities exempted from payment of duty on the importation into any given country. C. A. H.

FREEMAN. Modern conceptions of the distinction between freedom and non-freedom can be applied only with caution to ancient and mediæval history. As applied to the middle ages they are particularly misleading; for the most characteristic feature of the social conditions of the time was the existence of the intermediate position now commonly spoken of as SERFDOM (*q.v.*). Thus, under the later Roman empire, the large class of *coloni* were distinctly free by condition, with all the civil rights of other freemen, and even the power of suing their masters; they were nevertheless bound to the soil, and subject to burdensome duties from which they could not escape. A law of the fifth century distinguishes "the bond of colonate," *nexus colonarius*, from "the condition of slavery," *conditio servitutis;* and yet another, somewhat earlier, remarks that "though the *coloni* are of course free by condition, they must be looked upon as the slaves of the land on which they are born." Moreover the slave proper, during this period, by no means obtained that independence towards his former master, when he received manumission, which was gained by a modern freedman. He remained in close dependence upon him, usually as the cultivator of a holding on very onerous terms.

The question of the condition of the rural population in England in the earlier Saxon centuries is still undecided. But it is generally agreed that the position of the cultivators of the soil for at least two centuries before the Norman Conquest was substantially the same as that of the villeins and cotters after that event. If these cultivators were as a class identical with the *ceorls*, as is almost certain, they were doubtless technically free, though held in strict economic subjection, and bound to labour two or three days every week, and in busy seasons almost every day, for the lord of whom they held their land. Hence the Domesday survey, while it registers only some 12,000 persons (=heads of households) as freemen, *liberi homines*, and 23,000 as SOCMEN (*q.v.*) (persons, in all probability, in much the same position)—the "free men" being almost exclusively in Norfolk and Suffolk; and on the other hand notices 25,000 as slaves, *servi;* gives about 200,000 as falling into the classes of the VILLEIN and COTTIERS (*q.v.*), whose status between that of the LIBER HOMO and that of the SERVUS (*q.v.*) it leaves undetermined.

The introduction of the feudal jurisprudence after the Norman Conquest led to a greater importance being attached to the nature of tenure; and for the next four centuries the questions of tenure and personal condition were almost inextricably confused. The class of "free tenants," LIBERE TENENTES (*q.v.*), which grew so rapidly after the 11th century, was practically coextensive with that of "free men." But as to what exactly constituted free tenure the courts did not maintain a consistent doctrine. A very widely spread idea was that inability to give a daughter in marriage, or to sell an ox or a horse without the lord's consent, was a certain mark of servile tenure. On the other hand, exemption from the more laborious dues known as WEEK-WORK (*q.v.*) was frequently regarded as constituting free tenure; and villeins relieved from these obligations tended to rise to the class of freeholders. It is possible that in their desire to place the whole population in one of the two classes of free and non-free, the lawyers of the 13th and 14th centuries came at last to deny freedom to persons in a position which in Saxon times would have been regarded as free. But this more rigid

application of mutually exclusive terms did not necessarily involve any material degradation of the class in question, and was not inconsistent with a material elevation.

The legal identification of villeinage with non-freedom was probably beneficial to the class of chattel slaves which certainly existed in the 11th century. The servile stigma, attached to so large a part of the nation, ceased to involve any peculiar disabilities even in the case of the descendants of actual slaves, who became merged in the class of customary holders and copyholders. Slavery had long been forgotten when, in 1772, Lord Mansfield declared, in the case of the negro Sommerset, that slavery could not exist in England,—"a decision which did more credit to the hearts of the judges than to their knowledge of history." —The terms "freedom," and "franchise," were also applied to the possession of the rights of a burgher, and to membership of the city companies.

[For the Roman colonate see Fustel de Coulanges, *Recherches sur quelques problèmes d'histoire* (1885), espec. pp. 98 *seq.* The best introduction to the discussion on Saxon ranks will be found in note iii. to ch. viii. in Hallam's *Middle Ages*. For post-Saxon conditions in England the most important treatises, from very different points of view, are F. Seebohm, *English Village Community* (1883), espec. pp. 86 *seq.*, and P. Vinogradoff, *Villainage in England*, 1892 (summing-up pp. 217 *seq.*), whereon see also the criticism by Seebohm in *Eng. Hist. Rev.*, July 1892; by Ashley in *Econ. Rev.*, April 1893; and by Leadam in *Pol. Sci. Qu.*, Dec. 1893. On the disappearance of slavery, cp. Freeman, *Norman Conquest*, v. p. 140.

Reference may also be made to Sommerset's case in Broom's *Constitutional Law*, where the historical and juristic aspect of slavery is discussed with much learning.] W. J. A.

FREE TOWNS. In the article on mediæval cities (see CITY, MEDIÆVAL), it was pointed out that, though they had many features in common, in whatever part of western, southern, and central Europe they were established, yet their powers and privileges differed greatly according to their surrounding circumstances. In England and France, the growing predominance of the monarchical *régime* tended inevitably to curtail the rights of civic self-government, and it was only in those countries where the traditions of the old Roman empire were still strong, or the power of the new monarchical principle weak, that *free cities*, in the sense of more or less self-governing communities, were really established. They may be defined as cities possessing independent governments of their own, each virtually forming a state by itself; many were republics. It is, therefore, in Italy, Spain, the Netherlands, Germany, and Switzerland, that we find the historic examples of true civic liberty, though even in these cases the prestige of a feudal aristocracy, or hereditary oligarchy, or again the rise of a loose federation, or the proximity of an imperial suzerainty tended inevitably to modify the primitive features of that liberty. Italy is the historic ground of the free cities of the middle ages. There, owing to the weakness of the imperial sovereignty, whether emanating from Constantinople or Germany, the towns, especially in the northern portion of the peninsula, were able to raise themselves to the proud position of independent states, not only exercising complete control over their internal affairs, but waging war, making peace, and entering into alliances with each other, like the city-states of ancient Greece and Italy. Inland, Milan, Florence, Verona, and other cities contended with each other for empire over the fertile plains of Lombardy; while on the seaboard, Pisa, Genoa, and Venice raised themselves into great sea-powers in the east and west Mediterranean waters; and lesser cities, like Naples and Amalfi, scattered on the Italian coasts, followed their example with greater or less success. The enterprise and energy of all these cities alike was largely due to the fact that the fierce feudal aristocracy, that had sprung from the loins of barbaric invaders, had with its absorption into the civic life instilled the spirit of war into the workshop. The territory originally subjected, after the disruption of the Roman empire, to the count or bishop of these cities, had been reduced by concessions to the rural nobility, but after a while the cities began to reassert their sovereignty. Sometimes they besieged the strongholds of the nobility, sometimes they purchased feudal suzerainties, and finally by the 12th century there could hardly be found a single nobleman, except the marquis of Montferrat, and some noble families like those of Este and Malaspina, who had not given in their submission. The rural nobility, having lost its power outside the cities, strove to recover it inside, and by the erection of strongholds within the cities established a basis of further political and military operations. Hence a fierce belligerency at home and abroad is the chief feature of Italian republicanism; resulting in a striking development of the arts of war alongside those of peace, a development in some towns crowned with the laurels of an art and literature that recalled the palmy days of ancient Athens and Rome. Among the Lombard cities, Milan was most conspicuous for its wealth and wide-reaching power. By its warlike policy, shown in its ruthless conquest of neighbouring towns, like Lodi and Como, it drew on it the resentment of the imperial power in the person of Frederick Barbarossa, who in 1158 reduced the city, and handed it over to the vengeance of its enemies. He then proceeded to restore the imperial authority over the other towns of Lombardy, but his savage treatment led to a general insurrection in which

for a time local feuds were forgotten. After the victory of Legnano in 1176, the Lombard republics regained their independence, but the rivalry between the imperial and papal powers, taken up by their respective partisans the Ghibelines and Guelfs, introduced a new element of contention into the already stormy politics of northern Italy. Leagues were formed again and again between different cities on the new lines of cleavage, and, as was natural in a state war, under the cover of great principles various self-seeking tyrannies were established. During the 13th century there were four great groups of city-states to be found in northern Italy. The first included the cities of central Lombardy, Milan, Cremona, Pavia, Brescia, Bergamo, Parma, Piacenza, Mantua, Lodi, Alessandria, and others less known. The second group consisted of Verona, Vicenza, Padua, and Treviso. Another group was composed of the cities in Romagna, Bologna, Modena, Imola, Faenza, Ferrara, and others less important. The fourth cluster comprehended the whole of Tuscany, headed by Florence and Pisa. Sometimes the Ghibeline faction, sometimes the Guelf faction got the upper hand, and, according to the rise and fall of each, fresh wars and fresh alliances were entered into. We have an interesting account of the condition of Milan in 1288, from Galvaneus Flamma, a Milanese writer. The inhabitants are reckoned at 200,000, and the private houses at 13,000; the nobility alone dwelt in 60 streets, 8000 gentlemen or heavy cavalry might be mustered from the city and its district, and 240,000 men capable of bearing arms. In the district were 150 castles with their adjoining villages. The wealth and enterprise of the Milanese was astonishing, as was shown especially in the construction of the canal from the Tesino to the city, and the architectural splendour of the buildings. Their military ardour and commercial activity were equally conspicuous. The government of Milan and of the other Italian city-states was subject to continual change. In most of them the magistrates, elected after they threw off the rule, in the 10th and 11th centuries, of the count or imperial official or bishop, were styled in Roman fashion consuls. They were chosen annually, and generally from the ranks of the nobility; and they formed the responsible civil and military executive. There were besides legislative and deliberative councils. A council of trust and secrecy, consisting of a small number of persons, formed the advisers of the consuls; but the decision of high state affairs, such as treaties of alliance and declarations of war, the choice of consuls and ambassadors, rested with the general council of a more or less democratic type. About the end of the 12th century, as a result of the imperial intervention of Frederick Barbarossa, the custom arose in many cities of appointing, as a kind of temporary dictator, a citizen of some neighbouring state, though invariably a man of noble birth. He was called *podestà*, and held office for a year, though re-eligible. He received a fixed salary, and was compelled to remain in the city after expiration of office for answering charges brought against him. He could neither marry a native of the city nor have any relation resident in the city, nor even—so great was the fear of his being involved in the feuds and factions of the city—eat or drink in the house of any citizen. He was regarded as the highest arbitrator in all disputes, and sometimes superseded the consuls and commanded in war. There was great need of such an arbitrator in the Italian cities, where there were continual quarrels between the various noble families, and between them and the commonalty. The latter, composed of the artisans, were generally arranged into companies according to their occupations; and these fraternal guild associations were set over against the alliances of the nobility. The quarrels between social classes were further intermingled with the quarrels between political partisans, looking to the German emperor or the pope as their respective heads; while both kinds of quarrel were further embittered by personal outrages such as we read of in Dante and Shakespeare. Whoever conquered in these intestine conflicts, the state suffered from the merciless revenge of the conquering party, till at last the cities of Italy, like those of ancient Greece, were glad to be controlled by the strong though often cruel hand of some one family which established a quasi-hereditary despotism. At Milan, first the Torriani and then the Visconti raised themselves to power, and the latter gradually extended their sway over central Lombardy, overthrowing the reigning nobility in surrounding cities, and finally forming alliances with the French monarchy which in turn invaded and conquered north Italy. The history of the Tuscan is similar to that of the Lombard cities. Florence played the part of Milan. There too there was originally a more or less democratic constitution. The population was divided into fourteen companies or *arts*, the seven greater arts each electing a council of its own, with a chief magistrate or consul for civil jurisdiction, and a *gonfalonière* for military affairs. Criminal justice was administered by a *podestà* and a *capitano del populo*. But gradually, after many trials of various constitutions, political power became centred in the hands of some powerful family, till at last, in the 15th century, the famous Medici ruled supreme.

While Milan and Florence were gradually asserting their supremacy over the territory of northern and central Italy, three maritime cities, Pisa, Genoa, and Venice, were pushing their conquests over the Mediterranean Sea. It was these Italian cities that, after the general

disturbance of Europe caused by the irruption of the various tribes of barbarians and the devastating conquests of the Mohammedans, first succeeded in reviving the commerce of the Mediterranean world. As early as the age of Charlemagne, they had begun to carry on trade with the Greek cities, and imported to their own countries the rich commodities of Asia. In the 10th century the Venetians had formed a connection with Alexandria in Egypt, and the inhabitants of Amalfi and Pisa had also extended their trade to the same port. Later on, the crusades had poured riches into the laps of Venice, Genoa, and Pisa alike. These cities provided the necessary transports, and received enormous sums for their services as carriers. The crusaders also contracted with them for military stores and provisions, and the fleets of these cities kept on the coast, while the armies advanced by land, and during that advance sought every opportunity of promoting their commercial interests. Charters were granted to them, whereby they soon secured most extensive privileges in various settlements made by the crusaders in Asia. The property of entire suburbs in some, and of large streets in others, was vested in them, and the right of appointing their own magistrates assigned. When the crusaders seized Constantinople, the Venetians secured a part of it, and also part of the Peloponnesus in Greece and some of the islands of the Archipelago. With the conquest of many important maritime points in the eastern Mediterranean, trade with Asia revived. The Italian cities not only imported Indian commodities, but established manufactures of delicate fabrics in their own country, especially of silk. Silk weavers were kidnapped from the east of Europe, and settled in Italy, and silk stuffs gradually spread through Europe. The sugar-cane, indigenous in the east, was likewise imported into and cultivated in the west, whence it was eventually transported to America. After the decline of Pisa, partly owing to the rivalry of Genoa and the growing power of Florence, which conquered it early in the 15th century, Genoa contended with Venice for the commercial supremacy of the Mediterranean. Genoa had more especially command of the western Mediterranean and the northern part of the Archipelago and the Bosphorus. Caffa, a famous seaport on the Black Sea, and the port of Azov on the mouth of the Don, belonged to the Genoese, and served as *entrepôts* for their overland commerce with China and the Indies. Smyrna in Asia Minor, and the suburbs of Pera and Galatz at Constantinople, and the isles of Scio and Tenedos were ceded to them by the Greek emperors, and at one time they had the kings of Cyprus as their tributaries. Venice, starting from a more secure position in the lagunes of the northern Adriatic, pushed its conquests on the adjoining coasts of Dalmatia, Albania, Greece, and the Morea, and gradually secured settlements in Corfu, Cephalonia, and Crete. Genoa and Venice inevitably came into collision in the 14th century; and in the war of Chioggia, 1376-82, the famous Genoese admiral Peter Doria nearly succeeded in capturing Venice, which was only saved by the courage and energy of the Venetian admiral Vittorio Pisani. After this victory, Venice more and more secured her ascendency on the Syrian and Egyptian coasts, and the consequent trade with the east, till the discovery of the new sea route by the Cape of Good Hope handed over the oriental trade to the Portuguese and Dutch. The Italian traders naturally proceeded to find markets in western, central, and northern Europe, and to exchange their own commodities with those of other European countries. They were allowed the most extensive immunities in France in the 13th century, even greater than those granted to native inhabitants. As the Lombards, a name generally given to the Italian merchants, engrossed the chief trade of Europe, they became the chief bankers of Europe. By the church their money-lending was denounced as sinful and criminal, and, as a consequence, the interest charged was all the higher on account of the insecurity of their dealings, reaching even to 20 per cent. The chief northern mart for Italian goods was at Bruges. The sea voyage from the Mediterranean to the Baltic being of too prolonged a nature to be carried on in one summer, it was necessary to find some entrepôt or halfway centre for trade, and this was placed at Bruges. Here they exchanged the wool of England, the linen of the Netherlands, the furs, fish, and hemp of the Baltic for the silks, and spices, and silver of the south. The great galiasses, in which they carried their goods were the wonder of the north. At the beginning of the 13th century Bruges was famed as the greatest emporium of northern Europe, and the Hanseatic league of the Baltic cities established also their centre there, while Ghent and Ypres looked to it as their most powerful ally in their struggles with feudalism. For two centuries Bruges held its place, but the gradual closing of its channels, side by side with the increase of the size of trading ships, finally gave the supremacy to Antwerp. During the 15th and 16th centuries Antwerp surpassed all the ports of Europe in its commerce, and in 1568 its population reached 103,000; a civic population only exceeded by that of Paris. Its supremacy was destined in the following centuries to pass to London.

In Spain, although the cities, owing to the strength of the feudal nobility and the growth of the monarchy, never reached the complete independence of the Italian and German towns; yet in very early times, owing to the exigencies of the struggle with the Moors, the towns

of Castile and Aragon were invested with very important privileges or charters, on the condition of protecting their country. They had the right of appointing their own magistrates and common councils, which exercised civil and criminal jurisdiction over the inhabitants not only of the towns but also of extensive areas round them. They were bound in turn to pay certain sums and provide a certain force of armed men, horse and foot. Toledo, Saragossa, Valladolid, and others, became noted for their splendid enterprise. Barcelona, as a seaport, attained a special height of prosperity and power, and vied with the Italian cities on the seaboard in trade with Alexandria and the east. Its maritime laws are among the earliest mercantile jurisprudence of modern times, and were adopted by the Italian states. With other Spanish cities it secured special privileges in France, similar to those of the Italian towns; and Spanish silk and woollen goods, and the spices, drugs, and perfumes, imported from the east, spread far and wide in Spanish bottoms. See Prescott (*Ferdinand and Isabella*), vol. i. pp. 64-68.

Since the beginning of the 10th century, towns had been growing up in northern, southern, and western Germany, especially where the sea or rivers formed the easiest and safest means of communication, or where the traditions of Roman colonies had been handed down through the times of barbaric invasion. Lübeck, Hamburg, Bremen, and Frankfort, Cologne, Treves, Mainz, Strasburg, Worms, Speyer, Nuremberg, Ulm, Regensburg and Augsburg, and others gradually became places of importance, resting on the protection of imperial authority, and ready to fight for further privileges with the ecclesiastical or feudal oligarchy. During the 11th and 12th centuries these powers more and more extended under imperial encouragement, and towards the end of the latter century we find them electing councils of citizens, and in the following century appointing their own magistrates. The growing weakness of the empire naturally led to greater independence, and when, towards the end of the 13th century, the Hapsburg family succeeded to the imperial throne, we find the cities taking their place in the diet side by side with the feudal and ecclesiastical princes. In their struggle for freedom the cities found it necessary to form alliances. In the north there arose, about 1241, the famous HANSEATIC LEAGUE (*q.v.*), initiated by the cities of Lübeck and Hamburg. Their example was followed in 1255 by sixty cities forming the League of the Rhine. In 1370 this league was extended for a time by the adhesion of the cities of Swabia, while farther south the Swiss cities of Lucerne, Zurich, Glarus, Zug, and Berne joined with the three famous cantons of Uri, Schwyz, and Unterwalden in winning republican independence. Each of these German and Swiss towns formed rallying centres for the victims of feudal oppression, and kept alive the spirit of civic and industrial freedom.

FREE TRADE, THEORY OF. The term "free trade," or freedom of trade, at first used somewhat vaguely to denote absence of restraint in general, has now acquired a definite specialised sense. To MISSELDEN (*q.v.*), 1622, it meant "the free export of bullion"; to the opponents of the ADVENTURERS, MERCHANT (*q.v.*) "the abolition of the monopoly held by that body"; in the time of Sir Walter Scott "free-traders" meant smugglers (see *Guy Mannering*), at the opening of the 18th century, and in 1782 in Ireland, "the right to export freely." Adam Smith's authority, and the direction given by him to economic thought, have caused its limitation to that system of commercial policy which draws no distinction between domestic and foreign commodities, and, therefore, neither imposes additional burdens on the latter nor grants any special favours to the former. Free trade in this now well-established sense does not require the removal of all duties on commodities; it only insists that they shall be levied exclusively for revenue, not at all for PROTECTION (*q.v.*). "Our object," said Cobden, "is not to take away the queen's officers from the custom-house, but to take those officers away who sit at the receipt of custom to take tithe and toll for the benefit of particular classes" (*Speeches*, pop. ed. p. 41).

Free trade as a practical policy is based on the economic theory of INTERNATIONAL TRADE (*q.v.*), which explains the nature of the benefits obtained through foreign commerce, and shows that it is only carried on so long as it yields a gain to those concerned. But "if," as Cairnes urges, "nations only engage in trade when an advantage arises from their doing so, any interference with their free action in trading can only have the effect of debarring them from an advantage" (*Leading Prin.*, pt. iii. ch. iv. § 1). Foreign trade is a particular form or species of EXCHANGE (*q.v.*), and its utility is therefore at a maximum when impediments to its action are completely removed. The free trade doctrine thus rests on the most elementary economic facts, and is so simple as almost to appear trivial. The operation of free trade is negative; by removing obstacles it affords room for the

working of the normal and beneficent forces of commerce.

Again, free trade—to slightly change the point of view—has a reactive effect on production. DIVISION OF LABOUR (*q.v.*) only becomes possible by means of exchange, which permits each industrial group to confine its efforts to the most profitable employment, and to satisfy its various wants by exchange with other bodies. Elaborate and efficient production almost necessarily implies a developed system of trade. This is particularly true where specialisation of industry is due to local advantages. "The territorial division of labour," which forms no small part of the general movement, is in great measure dependent on facilities for foreign commerce, and is therefore promoted by the establishment of free trade. Each country can devote itself to those forms of production in which it has a comparative advantage (see INTERNATIONAL TRADE), and obtain from foreigners all other commodities. Individuals "find it for their interest to employ their industry in a way in which they have some advantage over their neighbours"; and, as Adam Smith proceeds to observe, "what is prudence in the conduct of every private family can scarce be folly in that of a great kingdom" (*Wealth of Nations*, ed. Nicholson, p. 185). Thus regarded, free trade appears to be an obvious dictate of common sense rather than the product of refined and difficult theory, a circumstance which accounts for the somewhat scornful tone that many advocates of commercial liberty have used towards opponents. There are, however, some complicating conditions which render the argument from division of labour harder to follow in foreign than in domestic trade. The individual producer has little difficulty in perceiving that a special line of work is more profitable to him than the attempt to directly supply all his wants by his own exertions. To the nation the first effect of foreign trade seems to be the displacement of so much home industry, with resulting loss to the supplanted producers. Hence the necessity for showing that an "imported commodity is always paid for directly or indirectly with the produce of our own industry," and "that the alternative is not between employing our own people and foreigners, but between employing one class and another of our own people" (Mill, *Principles*, bk. v. ch. x. § 1). Imported goods must undoubtedly be paid for, and, normally speaking, be paid for by the export of native products; but some power of analysis is needed to realise this truth amidst the complications of trade. Adam Smith meets the difficulty by insisting that "the general industry of the society never can exceed what the capital of the society can employ" (*Wealth of Nations*, p. 183), and that therefore regulations of commerce can only divert a part of that capital into an artificial direction. The individual is, however, able to determine the most profitable direction for the employment of his capital far better than the "statesman or lawgiver"; and he is urged to so use it by the stimulus of self-interest. Mill's "first fundamental proposition," viz. "that industry is limited by capital," with its corollary, that "demand for commodities is not a demand for labour," serves the same purpose (*Principles*, bk. v. ch. x. § 1). The optimistic doctrine of the *Wealth of Nations*, with its belief in the guidance of "an invisible hand" (bk. iv. ch. ii.), is replaced by the Ricardian theory of foreign trade, which assumes both the domestic mobility and the international immobility of labour and capital (cp. Bagehot, *Economic Studies*, p. 67), but either suffices as a basis for the free-trade position. Nor is it essentially altered by modern developments of the theory of WAGES (*q.v.*). Even if capital is not the sole limit to industry, and if efficiency in work is also to be taken into account; still as free trade tends to increase general efficiency, it follows that the "produce theory" of wages gives quite as valid a support to the policy of freedom. This general argument is strengthened by reference to the statistics of trade, and by consideration of the elements that make up international indebtedness (see COMMERCE), from which it appears that imports and exports stand in a definite relation to each other. The intervention of MONEY (*q.v.*), a potent cause of economic fallacies, further obscures the case; but the cardinal principle, that foreign like domestic trade is fundamentally barter in which goods are exchanged for goods, throws light on this side of the question. It is shown that a permanently favourable BALANCE OF TRADE (*q.v.*) is an impossibility, and even were it attainable, that it would not be advantageous, since the undue accumulation of the precious metals means the locking up of what would otherwise be productive capital.

By the analysis and exposure of the fallacies connected with (1) the sources of employment, and (2) the nature of the circulating medium, the argument for freedom of trade as a general rule has become a part of practical economics, and has been largely accepted by the educated public, and even recognised as the ultimate goal by such representative protectionists as LIST and CAREY. But its admission in the vague shape of an "abstract principle" or "theory" has not hindered the existence of widespread dissent to its reduction to "practice," a hostility not wholly due to ignorance and the influence of particular interests. Exceptions to free trade may be urged either on the ground of special economic conditions or by appealing to wider considerations than those relating to material wealth. Cases of both kinds are to be found in the *Wealth of Nations* (bk. iv. ch. ii.). Of the former the most important is that of temporary protection in order to encourage the development of infant industries, which, feeble

at first, will ultimately become self-supporting. This case requires the balancing of present against future advantage: immediate gain is to be sacrificed for a larger one at a later time. Such a policy applied to manufactures in general is the "industrial protective system" of List, regarded by him as suited for a particular stage of economic development. Its validity—with, however, stringent limitations—is conceded by Mill (*loc. cit.*), and more unreservedly by Prof. Sidgwick (*Pol. Economy*, bk. iii. ch. v. § 1), and Roscher (*System*, vol. iii. § 138). Adam Smith's contention that individual enterprise is a better guide for industry than the dictates of governments, seems, as he himself held, to be fully applicable here. The difficulties in selecting the industries to be encouraged, and the amount of protection required by each, have been justly dwelt on by free traders (see especially Wise, *Industrial Freedom*, pt. iv. ch. ii. and app. ii.) who have further asked without much result for evidence of the successful use of protection for this purpose. Thus, while it is theoretically possible that the temporary protection of a particular industry might yield a surplus of advantage, it is plain that the discovery of such an instance will be much rarer than the injurious employment of the same instrument in unsuitable cases (see BOUNTIES).

Protection may also be sought on like grounds, for older industries become for the moment unprofitable through a temporary disturbance in trade conditions (Sidgwick, *Pol. Econ.*, bk. iii. ch. v. § i.), and should be tried by the same tests.

The foregoing argument has some affinity with the plea that diversity of industry is economically beneficial, especially in a new country, and therefore deserving of encouragement. The advantages of the "home market" as affording a steady demand, and saving the cost of transport, have been unduly emphasised by protectionists with curious disregard of the fact that cost of carriage is a natural protection to the home producer, and only overcome by the greater benefit of foreign trade. Experience, besides, does not confirm the belief that fluctuations are less frequent in a limited market, nor does it show that diversity of industry is incompatible with complete freedom of trade.

In like manner the possibility of enlarging the national market by causing immigration of labour and capital, or of hindering its contraction by checking their efflux, has been alleged as a good reason for the use of protection, and the claim has been theoretically admitted by some economists (*e.g.* Prof. Sidgwick, *Pol. Econ.*, bk. iii. ch. v. § 3). Unless, however, in the case of a country possessing the sole or chief market for a commodity, it is hard to see how the imposition of duties will even tend to draw in labour, as the cost of living will almost certainly be higher, while the investment of foreign capital will depend on the prospect of a high return, which is not likely to be increased by the adoption of protection.

A much more plausible argument for departing from the free-trade rule is that based on the idea of preserving national resources. A country's mineral stores form a stock which is being gradually worked out, and it may be held that protective duties on imports will act as a check to their too rapid use (*cp.* Jevons, *Coal Question*, Preface). Again, as Carey urges, food-exporting countries may exhaust the fertility of their soil—or to take a further step in refinement of the doctrine—may find the Margin of Cultivation pushed to a lower point. Thus the community experiences the same effects that would follow from an increased population at home (*cp.* S. N. Patten, *Economic Basis of Protection*, pp. 47, 48). On the other hand, the gain to the landowners, and therefore to the revenue of the society from an increase in rent must be taken into account as well as the cheaper terms on which imports are obtained under free trade; and on the balance it is probable that even in so peculiar a case the advantage would be on the side of freedom.

On the border between economic and political exceptions is the proposal to make freedom of trade dependent on reciprocity. If based on the belief that trade to be advantageous must be free on both sides, the idea is clearly fallacious, but where it simply aims at removing foreign protective duties and thus securing wider freedom of trade in the future, it "may be good policy," as Adam Smith (*Wealth of Nations*, p. 190) asserts, since "the recovery of a great foreign market will more than compensate the transitory inconvenience" of retaliation. Here, however, as in respect to infant industries, the probability of success is much smaller than that of failure, owing to the inevitable irritation produced in foreign countries by retaliation, which leads to increase rather than reduction of protective duties.

All the preceding cases have often been supported on non-economic grounds, but chief stress has been laid on the economic gain to be sooner or later derived. Different in kind is the preference of national security to increase of wealth, which formed the strongest argument in support of the CORN LAWS and the NAVIGATION LAWS, and which actually won for the latter the favourable judgment of Adam Smith (bk. iv. ch. ii.), and of J. S. Mill, who, however, approved of their repeal. In such instances the question is one for the statesman rather than the practical economist, but in making a calculation the economic loss, though not of itself decisive, should never be dropped out of sight, as opulence is one of the chief elements of political and military power.

Social protective duties (*sociale Schutzzölle*) have been advocated in order to hinder the degradation of labour, in consequence of the pressure of foreign competitors working under inferior conditions of life, and in countries with stringent FACTORY LAWS (see also FACTORY ACTS) the plea has in certain cases an apparent force. In its more extreme form, as in the United States, where protection against the "pauper labour" of Europe is a popular cry with the opponents of free trade, it is only a repetition of the fallacy already noticed that free trade reduces the amount of employment, and it also erroneously assumes that with unrestricted commerce wages will everywhere fall to the lowest existing level, though it is obvious that IMMIGRATION of poorly-paid foreign labour, which is the real cause of lowered wages, may happen under, and even be stimulated by, the most rigid protection.

On the whole it does not appear that the various exceptions suggested to the broad canon of free trade have much practical weight, at least in the present stage of social development, though they suggest some interesting qualifications of economic theory. Some of them are connected with the possible evils that accompany extended division of labour—evils not sufficiently recognised by the older English writers, but nevertheless of serious social import. They further bring out the varying consequences that follow from the action of industrial effort according as it is placed under the law of INCREASING RETURNS or under the law of DIMINISHING RETURNS, and show, as Mill had briefly noticed (*Principles*, bk. v. ch. x. § 1), that agricultural and manufacturing communities are not affected in the same way by free trade. The "infant industry" argument gains its force from the consideration of time; it appeals to the future as against the present. The real nature of national interest, and its possible divergence from the individual interests of producers and consumers, have been brought into stronger relief, without, however, invalidating the proposition that in the main the interest of the community is served by the widest freedom.

The result then is that the practical policy of free trade is a sound deduction from established economic doctrines, and that any proposed exception must be clearly made out by its advocates, on whom the burden of proof rests, and who are bound not merely to adduce special circumstances that appear to favour the claim, but to take into account all the surrounding conditions, and to give due weight to each. Submitted to such a test, the most plausible cases for interference with the normal course of trade turn out to be theoretical subtleties, not practicable or advisable expedients.

[The literature of the subject is too extensive for adequate notice. Adam Smith, *Wealth of Nations*, bk. iv., is the source of the most effective free-trade arguments. The petition of the merchants of London, 1820 (in *Wealth of Nations*, ed. M'Culloch, note 15), drawn up by Thos. Tooke (Tooke and Newmarch, *History of Prices*, vol. vi. p. 335), summarised them most concisely.—F. Bastiat, *Sophismes Économiques*, Œuvres, tomes iv. and v., contain the most brilliant exposure of popular fallacies.—W. G. Sumner, *Protectionism*, New York, 1883, and B. R. Wise, *Industrial Freedom*, 1892, deal with the latest phases of the controversy. See also references given above, and for writers who have opposed, see articles on A. A. COURNOT; and PROTECTION.] C. F. B.

FREE TRADE, EARLY HISTORY OF. The free-trade agitation of the 19th century, itself only one phase of the growth of the competitive system, was the last though not the final stage of a great movement extending over several centuries. As we may expect, therefore, the expression "free trade" has different meanings at different periods in the economic history of the country. The foreign merchants of the middle ages who desired to obtain a footing in England on a free-trade basis, meant by this expression that, subject to the payment of the usual customs, they should be allowed to exercise their calling in English ports and mart towns without let or hindrance; that they should not be subjected to unreasonable exactions; that their ships and goods should not be arrested without due cause, etc. The English "free trader" of the latter part of the 16th century wished to see the revival of the regulations of the STAPLE system, and the withdrawal of the privileges of exclusive trading companies, such as the Merchant Adventurers. In the 17th century he meant the broadening of the basis of the companies, so that all who desired might obtain admission on easy terms. There were also some writers, such as Roger COKE (*q.v.*), who clearly perceived the advantages of free importation, of the repeal of the navigation acts, and of the acts restricting certain trades, such as the cattle and woollen trades of Ireland, and who advocated the more enlightened policy of the Dutch in the regulation of commerce. The free trader of the 18th century advocated the removal or reduction of duties on imports and exports, but at this time he seldom belonged to the commercial classes. It is impossible, therefore, to understand the significance of the various phases of the free-trade movement, apart from the general economic conditions which prevailed when each phase became prominent. From the standpoint of to-day, for example, the elaborate regulations of Edward III.'s great Ordinance of the Staples appear unwise and oppressive. But the experiment of dispensing with staple towns had been tried and had led to bad results. In the policy he adopted with regard to foreign merchants, he was singularly favourable to their claims; and many of his statutes were intended to give security to

traders, to repress lawlessness, to provide means of settling disputes, or to place the collection of customs on a satisfactory basis. These elaborate regulations, so far from being a restraint on trade, were frequently the means which made trade possible. Moreover it does not appear to have been difficult to obtain exemption from the staple acts when it could be shown that such a course was advantageous, and throughout the middle ages there were numerous bodies of merchants, such as the Hanse merchants, the merchants of Florence, Venice, etc., who enjoyed such privileges. So also, the elaborate commercial treaties of the 14th and 15th centuries have been too hastily condemned by some writers. If they had been arbitrarily imposed by governments on unwilling communities where there had formerly been free exchange of commodities, and where there were all the conditions requisite for peaceful and uninterrupted commerce, they would have been an unwarrantable interference with the course of trade. But these assumptions would be incorrect. Though unwise regulations were frequently adopted, the effect of the commercial treaties was to assimilate the conditions of different countries and communities, to build up the fabric of international law, and to extend trade far beyond the limits which would have been possible in a state of perfect freedom. With the growth of capital and industry, the rise of a manufacturing class, and the development of a national foreign trade which took place in the 15th century, the prevailing hostility to foreigners became more strongly marked. The demand arose for the encouragement of native commerce, and the protection of English industries. The reign of Edward IV. is full of acts of parliament passed with this object, and from this time onwards we can note the gradual development of the great protective system which was not overthrown till our own day. The privileges enjoyed by foreign merchants were restricted. Those of the Hanse merchants, who attained their greatest influence in England in the 15th century, were suspended by Edward VI., and after a partial renewal under Mary and Elizabeth, were finally withdrawn by the latter. English trading companies were incorporated, protective tariffs imposed, corn laws and navigation acts were passed, and the country was apparently getting deeper and deeper into a narrow national policy. We cannot here discuss the question how far the mercantile system achieved the objects which its advocates had in view (*vide* ENGLISH EARLY ECONOMIC HISTORY; HANSEATIC LEAGUE; MERCANTILE SYSTEM; NAVIGATION ACTS). The period which saw its growth saw also the growth of the forces which led to its final overthrow. Throughout their history the policy of confining the foreign trade of the country to exclusive trading companies was subjected to much hostile criticism. It was assailed in Parliament, and in the works of economic writers. The regulations of some of the companies were modified to meet the claims of outsiders; Cromwell tried the experiment of a free and open trade with the East Indies; privileges were granted to bodies of merchants in contravention of the charters of the companies; in a great debate at the committee on trade in 1657, only two persons were favourable to the Merchants Adventurers, while all the other members were for the free merchants. There were many men like Ralph GARDINER (*q.v.*), who were willing to suffer much in the struggle against monopoly; and after the revolution of 1655, few of the old companies are of great practical importance except the EAST INDIA COMPANY (*q.v.*), which itself was reorganised on a national basis. With the 18th century the movement for the removal or reduction of duties on imports and exports becomes important. It can best be traced in the history of the commercial treaties of the period and the negotiations which led up to them, *e.g.* the METHUEN TREATY with Portugal (1703), the Treaty of Utrecht (1713), the commercial clauses of which were drafted by Arthur Moore, and W. PITT'S commercial treaty with France (1786). In the first we have a typical treaty framed on the principles of the mercantile system. "The Methuen Treaty" said Fox in 1786, "had justly been considered as the commercial idol of England." The eighth and ninth clauses of the Treaty of Utrecht raised a storm amongst the commercial classes, for they were an attempt to move in the direction of free trade with France. It was found impossible to carry them, though the principles they embodied were most ably advocated chiefly by Arthur Moore in Parliament, and by Defoe in *Mercator*. Pitt's treaty, avowedly an attempt to carry into effect the teaching of Adam Smith, was passed without serious opposition,—"No great manufacturing body of men" said Pitt, "had taken alarm,"—and during the short period of its operation before the outbreak of the war with France it was very successful. Many other illustrations of the growth of free-trade principles during the 18th century may be given, such as Walpole's commercial and colonial policy, Pitt's Irish propositions, etc. The principal obstacle in their way was the bitter hostility of the commercial classes. But there can scarcely be any doubt that but for the French revolutionary war, and the difficulties into which it plunged the country, Pitt would have anticipated by fifty years the later free-trade movement.

W. A. S. H.

Free trade principles were early maintained in France by the economists, being a natural deduction from their principle of *laissez-faire* and a necessary corollary to their doctrine

that freedom in exchange, an absolutely unshackled use of the wealth of individuals, could not be dissociated from the full enjoyment of the rights of private property (see DUPONT DE NEMOURS; ÉCONOMISTES; ÉPHÉMÉRIDES; PHYSIOCRATS; QUESNAY and TURGOT).

FREE TRADE,—MODERN HISTORY OF. The history of the modern movement in favour of free trade practically begins with the year 1786, when Pitt concluded a commercial treaty with France which abolished many of the protective duties between the two countries. Ten years before, however, a great impetus had been given to free-trade doctrines by the publication of Adam Smith's *Wealth of Nations*. Yet the protective system was so interwoven with our commercial policy at home and abroad, that no really successful assault could be made upon it until nearly forty years after the passing of Pitt's French treaty. With the appointment of WILLIAM HUSKISSON (*q.v.*) as president of the board of trade in 1823, a complete change came over the commercial policy of England, and the bulwarks of protection began to give way. In the session of 1823 Huskisson carried his Reciprocity of Duties Bill, a measure which largely modified the effects of the NAVIGATION ACTS (*q.v.*), by freeing English and foreign shipping. He next reduced the duty on raw and spun silk, and lowered the import and export duty on wool. The right of free emigration was restored to artisans, and the laws controlling the combinations of either masters or workmen were repealed. "These were the beginnings of free trade; but a further development of political liberty was essential to the triumph of that generous and fruitful policy" (Lord Farnborough's *Constitutional History of England*, vol. ii.).

Various efforts to regulate the price of corn by act of parliament were made in 1773, 1791, 1804, 1815, and 1822; but in consequence of the ill effects of such legislation in 1825-26—years of severe commercial panic—the privy council was authorised to issue orders to suspend the operation of the acts, and to permit the importation of foreign corn under circumstances of necessity. Grave doubts now arose as to the soundness of a protective policy and the beneficial operation of the corn laws; and during the brief administration of George Canning in 1827, that brilliant and progressive statesman carried resolutions in the House of Commons pointing to a more liberal policy. A relief bill based on the resolutions passed the Lower House, but owing to Canning's death and the opposition of the Duke of Wellington in the Lords, the measure was lost. In 1828, when the Duke had assumed office, with Peel and Huskisson among his colleagues, the duties on foreign corn were regulated in accordance with a new sliding scale. By an act passed on the 15th of July the import duty on wheat was to be 25s. 8d. per quarter when the average price in England was under 62s.; 24s. 8d. when from 62s. to 63s.; and so to be gradually reduced to 1s. when the average price was 73s. and upwards.

Catholic emancipation and parliamentary reform now absorbed public attention for some years, and nothing further was done to remedy the grievance of the corn laws. The abundant harvest of 1835 came as a slight relief by making bread cheaper for the people, and the year 1836 witnessed no direct action in parliament on free-trade questions. But early in 1837, in consequence of the deficient harvest in the previous autumn, followed by a commercial collapse, an anti-corn law association was formed in London. On the committee were twenty-two members of parliament, including George Grote the historian, J. Silk Buckingham, founder of the *Athenæum*, T. S. Duncombe, Joseph Brotherton, W. Clay, Joseph Hume, J. A. Roebuck, Colonel Perronet Thompson, and Sir W. Molesworth. Three popular writers and poets—Thomas Campbell, Ebenezer Elliott, and William Howitt—were also upon the committee. In the House of Commons, Mr. Clay endeavoured to procure a modification of the corn laws. He moved the adoption of a fixed impost of 10s. per quarter on wheat, in lieu of the sliding scale of duties, but his resolution was lost by 223 votes to 89. In September 1838, Dr. (afterwards Sir John) Bowring addressed a meeting of fiscal reformers at Manchester, which had been hastily called together by Mr. A. Prentice. A proposition to form an anti-corn law association was welcomed with enthusiasm. A preliminary meeting, attended by seven earnest reformers, was held on the 24th of September, and on the 13th of October there was published in the *Manchester Times* a list of thirty-eight gentlemen, as a "Provisional Committee of the Manchester Anti-Corn Law Association." The name of John Bright appeared in this first list, and that of Richard Cobden in the second list, issued a week later. A young medical student named Paulton delivered eloquent lectures in various towns on the advantages of free trade, and Lancashire was soon stirred to action. On the motion of Mr. Cobden, the Manchester chamber of commerce petitioned parliament against the corn laws. The free-trade organisation assumed a larger character in 1839, and became formally known as the National Anti-Corn Law League. A journal entitled the *Anti-Corn Law Circular* was established to advocate the movement. Mr. C. P. Villiers, one of the earliest pioneers of the advancing cause (still living, 1895), now took the lead in parliament, and annually brought forward his resolution in favour of free trade. In March 1839 his motion for a committee on the corn laws was rejected by

342 to 195, and in 1840 by 300 to 177. Lord Fitzwilliam's resolutions in the House of Lords condemnatory of the corn laws were rejected in 1839 by 224 votes to 24, and in 1840 by 194 to 42. During the debate in the Lords on 14th March 1839, the premier, Lord Melbourne, said, "To leave the whole agricultural interest without protection, I declare before God I think it the wildest and maddest scheme that has ever entered into the imagination of man to conceive." In the session of 1840, 763 petitions, with 775,840 signatures, were presented to the House of Commons against the obnoxious laws. In the session of 1841 ministers proposed a fixed duty of 8s., but no measure was brought in owing to the dissolution. Sir Robert PEEL (*q.v.*) came into power in September, and in the ensuing winter there was such terrible distress in all the great centres of population that a conviction gained ground of the absolute necessity for some change in the restrictive laws which pressed so heavily upon the community.

Early in 1842 Mr. Bright stepped into the front rank of the repealers, and created much effect by his earnest eloquence. With Cobden, Villiers, and Wilson, he was instrumental in forming many provincial branches of the league. The government was now moved to action, and in the session of 1842 Peel carried his new sliding scale. By this, there was to be 20s. duty when the price was at 51s., decreasing to 12s. at 60s., and 1s. at 73s.; the duty was not to exceed 20s. when the price fell below 51s. An amendment in favour of a fixed duty, proposed by Lord John Russell in the Commons, was rejected by 349 to 226, and a similar amendment proposed by Lord Melbourne in the Upper House was lost by 207 to 71; an amendment in favour of total repeal proposed by Mr. Villiers in the Commons was rejected by 393 to 90, and a similar amendment brought forward by Lord Brougham in the Peers was lost by 109 to 5. The second reading of the Sliding-scale Bill in the Lords was carried by 119 to 17. To meet the growing deficit in the revenue, which had now become very serious, Peel brought in a bill for the imposition of an income tax of 7d. in the pound, to be levied for three years. But in order to alleviate the new burden, he either partially or wholly abolished the duties on numerous important articles, such as drugs, butter, eggs, cheese, lard, dye-woods, cattle, sheep, pigs, and salted meat. The Manchester Free Trade Hall, built by the repealers on the site of the Peterloo massacre, was opened 30th January 1843. At the inaugural meeting subscriptions of £40,600 to the league fund were announced. In February, the House of Commons was invited by Lord Howick to discuss the question of free trade on a side issue, when his lordship moved for a committee to inquire into the distress of the country. During the debate a strange scene occurred. After a powerful speech by Mr. Cobden in favour of repeal, Sir Robert Peel rose, and in his excitement indirectly insinuated that Mr. Cobden was inclined to favour his assassination. The unhappy incident arose out of a misinterpretation put upon certain words by Mr. Cobden. The premier's overwrought feelings were further intensified by the attempt upon himself which had resulted in the death of his secretary Mr. Drummond. The affair passed over, and Lord Howick's motion was rejected by 306 to 191 votes. Votes of sympathy with Mr. Cobden were passed at various public meetings. In the spring of 1843 the league held a series of demonstrations in Drury Lane Theatre. Lords Russell and Monteagle brought forward motions in parliament to inquire into the effects of Peel's sliding scale, but they were rejected in the Commons and Lords respectively by 244 votes to 145, and 200 to 78. Mr. Villiers's motion for total repeal was rejected this year by 381 to 125, but in the minority were several prominent and ex-official whigs. The council of the league distributed, in 1843, tracts, and publications, etc., to the number of 9,026,000. It was also determined now to raise a fund of £100,000 to further the objects of the league. In March 1844 Mr. Cobden moved for a committee of the House of Commons to inquire into the effects of protective duties on agricultural tenants and labourers, but he was defeated by 224 to 133. Mr. Villiers's annual motion was subsequently brought forward and lost by 328 to 124, but Mr. Bright predicted that either Sir Robert Peel would abolish the corn laws or his government would be overthrown. At a great meeting held in Covent Garden Theatre, Mr. Cobden announced that they would petition the existing House of Commons no more, but would memorialise the Queen direct in favour of the immediate dissolution of parliament.

Sir Robert Peel brought forward the Budget for 1845 on the 14th of February. There was a surplus of £3,409,000, which he proposed to devote to the reduction of the sugar duty, the abolition of the duty on glass, cotton, wool, and on the importation of Baltic staves. He also proposed to abolish the duty on all those articles which merely yielded nominal amounts, a step which would sweep away 430 articles from the tariff. The budget was not thorough enough for the friends of the league, who complained that it took away with one hand what it gave with the other. On the 7th of March Mr. Cobden moved for a select committee to inquire into the causes and extent of the existing agricultural distress, and into the effects of legislative protection upon the interests of landowners, tenant farmers, and farm labourers. The motion was lost by 213 to 121.

Early in May a great bazaar in connection with the league was held in Covent Garden Theatre. On the 26th of May, Lord John Russell brought forward eight resolutions in parliament in the hope of forcing on the question, and shortly afterwards Mr. Villiers repeated, for the last time, his annual motion for the abolition of the corn laws. On this occasion Mr. Bright said that Sir Robert Peel knew well enough what the country wanted, and he ought to do it, being the only statesman competent for the task. The premier brushed aside Lord John Russell's resolutions, and, in replying to the motion of Mr. Villiers, said that he could not see his way to apply the principle of free trade completely to agriculture and the total abolition of the corn laws. But there were signs of wavering and perplexity in the premier's mind. When the House rose on the 8th of August there were grave apprehensions as to the approaching harvest, and it was felt that the question of the continuance of the corn laws was mainly dependent upon the variations of the barometer. That which actually occurred was worse than the anticipation. The harvest was deficient in Great Britain, while in Ireland the potato crop, the staple sustenance of the population, failed entirely. Terrible suffering ensued, and at a mass meeting at Manchester on the 28th of October, Mr. Cobden called on Sir Robert Peel to save the country, which was menaced by famine. The cabinet met frequently, being much discomposed at the aspect of affairs; but even in this narrow circle there were strong differences of opinion as to the measures required. On the 22nd of November Lord John Russell issued a manifesto to the electors of the City of London declaring for the abolition of the corn laws. "Let us unite," wrote his lordship, "to put an end to a system which has been proved to be the blight of commerce, the bane of agriculture, the source of bitter divisions among classes, the cause of penury, fever, mortality, and crime among the people." This address precipitated matters, and it was followed by similar declarations from Lord Morpeth at Leeds, and Mr. (afterwards Lord) Macaulay at Edinburgh. The cabinet met on 25th November, and the crisis was now felt to be most urgent. The ministerial discussions lasted for several days. At length the Duke of Wellington gave way, and on the 3rd of December the *Times* made the startling announcement—received in many quarters with incredulity—that the abolition of the corn laws had been resolved upon, and that parliament was to meet at once to consider the question. As Lord Stanley, however, and some other ministers absolutely declined to support complete abolition, the premier resigned. Lord John Russell endeavoured to form a government, but his negotiations fell through, and Peel was recalled. Foreseeing that he could carry abolition through the combined efforts of his own friends and the whigs and free-traders, he consented to resume office, and Lord Stanley was replaced in the government by Mr. Gladstone.

Meanwhile, the anti-corn law league did not relax its efforts. An important meeting was held at Manchester on 23rd December, when it was resolved to raise a fund of £250,000 for the purpose of promoting free-trade principles in the existing emergency. Upwards of £60,000 was subscribed in the room in an hour and a half—the largest sum ever subscribed in the same space of time for any cause. On the 27th of January 1846 Peel brought forward his measure for the abolition of the corn laws before a crowded House of Commons. Prolonged debates took place at each stage of the bill, but eventually, on the 16th of May, the third reading was carried by a majority of 98 in a house of 556. The list of 327 members who voted in favour of the bill included 104 conservatives, and 223 whigs and liberals; the minority of 229, with the exception of seven votes, was composed exclusively of conservatives. Partly through the arguments and influence of the Duke of Wellington, the House of Lords passed the second reading of the bill by a majority of 47 votes, and the measure became law on the 25th of June. On the same day the Peel ministry fell upon the Irish Coercion Bill. The premier, in his speech on leaving office, delivered on the 29th, reviewed the course and policy of his government, paid a warm tribute to Mr. Cobden, and closed with these memorable words—"It may be that I shall leave a name sometimes remembered with expressions of goodwill in the abodes of those whose lot it is to labour, and to earn their daily bread by the sweat of their brow, when they shall recruit their exhausted strength with abundant and untaxed food, the sweeter because it is no longer leavened by a sense of injustice." The measure for abolishing the corn laws provided that from the passing of the act, and until the 1st of February 1849, the maximum duty would be 10s., exigible when the price was under 48s., and it was to fall a shilling with every shilling of rise in the price till the latter reached 53s. or upwards, when the duty was to remain at the minimum of 4s. The duties on barley and oats would undergo an alteration proportionally the same; while all grain from British colonies was to be admitted free of duty, and maize or Indian corn was to be admitted, immediately after the passing of the act, at a nominal duty. Other articles in the tariff, under the heads of articles of food, agriculture, manufacture, etc., were dealt with to the number of several hundreds, in the way of duties repealed or reduced. The duty on corn was to cease in 1849, with the exception of a registration duty of 1s. a quarter, abolished in 1869. This was resumed for one year, 1902-1903.

The Anti-Corn Law League was dissolved on the 2nd of July 1846, its work having been practically accomplished. It had a temporary revival, however, in 1852, when there was some fear that the brief administration of Lord Derby would return to a protectionist policy. After the abolition of the corn laws other restrictions upon the freedom of trade were gradually removed. The navigation laws were repealed in 1849, and in 1853 Mr. Gladstone greatly relieved the tariff by the reduction or total remission of imposts on 133 articles. Further steps in abolishing protective impediments were taken in 1860, 1869, 1874, etc. The policy of free trade in the United Kingdom has been justified by its effects on the prosperity of the country; for just as the free-trade system has enabled us to take the utmost possible advantage of periods of prosperity, so it has enabled us to meet phases of reaction and adversity with less strain on our resources than any of the protected countries. The British tariff is now virtually one for revenue only, and under this system we have secured a great expansion of both home and foreign trade. As the tendency of all our recent financial legislation has been towards the general abolition and diminution of duties in order to liberate trade, our commerce has shown in consequence a remarkable elasticity and power of recuperation in depression. (See MANCHESTER SCHOOL.)

FREGIER, A. (1789; died soon after 1850), an official of the prefecture of the department of the Seine, was from 1824 to 1830 secretary of the *Conseil de Préfecture*, and from 1830 to 1843 head of the *Bureau du Domaine* (state property) in Paris. He wrote principally on subjects connected with the dangerous classes in large towns:—*Des Classes Dangereuses dans les grandes Villes* (Paris, 2 vols. 1839-40), and *Histoire de l'Administration de la Police à Paris depuis Philippe Auguste* (Paris, 2 vols. 1850). His pamphlet, *Solution Nouvelle du Problème de la Misère* (Paris, 1851), is in favour of a *minimum* rate of wages, to be fixed by the local authorities according to the cost of food and lodgings, coupled with an interdiction of employing *married* women in factories (p. 37), and of erecting new factories in large towns (p. 44). These rules were only to be applied to manufacturers employing more than twenty workmen. E. Ca.

FREIGHT is the reward paid by the owner of goods to the shipowner for the service of transporting merchandise from the agreed place of shipment to the agreed place of delivery. It accrues usually under written contracts called charter-parties or bills of lading. When an entire ship is hired for service a charter-party is made. When a part cargo is laden in what is called a "liner," a "berth" ship, or sometimes, a "general cargo" ship, no charter-party is made between the owner of the goods and the shipowner, but a bill of lading is issued to each shipper for his own parcel of goods, and the cost of freight as well as all the other conditions of the contract are set forth therein. In the latter class of cases freight is generally prepaid, the payment being made in exchange for the bill of lading. In the former class—where a charter-party is drawn up, and the whole ship is hired, the method of payment varies very much. Sometimes the freight is paid partly in advance at the time of shipment, but most frequently it is paid at the time and place of delivery. If in either case the goods are not delivered at the agreed port of destination, and the freight has not been paid in advance, no freight becomes due, no matter what portion of the voyage may have been accomplished. By the laws of some Continental States what is called "distance freight" is due to the ship when an accident prevents the vessel carrying the goods to the agreed destination, except in the case of total loss; but English law does not recognise any freight to be due which the charter-party makes payable at the port of destination on due delivery of the goods until the goods are so delivered. In the absence, however, of express stipulation to the contrary, freight, once prepaid in accordance with the terms of either charter-party or bill of lading, is not recoverable from the shipowner if, through the occurrence of some sea peril, the vessel fails to make delivery at the port of destination. The theory in this case is, that such prepayment of freight is added to the value of the goods shipped, and that the insurable interest in the amount prepaid vests in the owner of the goods, the value of which is enhanced by this prepayment. The shipowner has not always an insurable interest in prepaid freight. It is not at sea-risk, from the fact that it is paid. The shipowner has it, and no sea peril makes him liable to return the money if the goods are not delivered. The incidents of freight no longer attach to the money so paid.

The word "freight" covers a good many variations, such as chartered freight, bill-of-lading freight, owners' freight, charterers' freight, lump-sum freight, and dead freight, indicating various contract relations to the thing itself. Lump-sum freight means an agreed amount for a voyage, irrespective of the number of tons delivered, so that, unless otherwise provided, the lump sum is payable at destina-

tion, even although part of the cargo may have been lost from sea perils during the voyage. Dead freight is money due to the shipowner in respect of goods agreed to be shipped but not shipped by the person who has failed to make the shipment according to his contract to do so. It may also be observed that the word freight has a more exclusive significance between the shipowner and an underwriter in a policy of insurance than it has between the shipowner and the owner of the goods under charter-parties and bills of lading.

When freight is payable on right delivery at the agreed port of destination, the shipowner is entitled to payment even if the goods are delivered damaged, but the shipowner incurs liability for the value of non-delivered goods stated by bill of lading to have been shipped, or for which a receipt has been given; a claim against the shipowner for damaged goods also holds good where fault or negligence is proved. Shipowners contract themselves out of liability to pay for damaged goods in certain specified cases, and if the goods arrive in specie freight is always payable.

Many disputes occur as to where freight is payable. It has been held that the captain should deliver the goods first and claim payment afterwards. This, however, conflicts with two important conditions. The first results from the common-law dictum, which gives the carrier a lien for freight on the goods he carries. Obviously, his lien lasts so long as the goods are in his custody, and cannot be exercised after they have passed into the premises or possession of the person by whom the freight is payable. To be available against him, payment before getting possession is essential. The second results from a condition now frequently inserted in charter-parties, by which the charterer stipulates that after the cargo is once shipped his liability under the contract shall absolutely cease, and that the shipowner shall look to, in other words, exercise his lien on, the cargo to secure payment of the agreed freight; so that if he fails to do so, and, from any cause cannot, after delivery, get the freight from the receiver of the goods, he shall have no right to come back on the original charterer and enforce payment against him under the charter. In business language this is called the "cesser-clause." The shipowner, therefore, has lien both by common law and by special contract, and, in consideration of the latter, generally gives specific release from liability to the original charterer, after he has once shipped the cargo on which the shipowner's lien for freight is to accrue. In consequence of these two conditions it has been held that the master should deliver and the consignee receive the goods at the ship's side, and that on such delivery the master ceases to be responsible for the goods, and to have any lien, so that he is justified in refusing to proceed with the delivery unless the freight is paid. These considerations secure that delivery and freight payment are, as nearly as possible, coincident, and have the effect of preventing shipowners from making bad debts on the one hand, and, on the other, of saving charterers from paying freight twice over, both being equally objectionable. In practice they work easily although this description makes them look rather elaborate.

Freight has become, in recent years, an object of greatly increased interest to the inhabitants of the United Kingdom. Three-quarters of a century ago we could generally feed ourselves by our own productions. Since then the population has increased more than 50 per cent. And the economic condition of the larger population is so much improved that the scale of consumption is much larger than in former times. Less than half the commodities consumed now are produced here, and it is certain that of our daily bread, less than a fourth part is grown at home. The carriage of these vast supplies of food, in addition to the raw materials for our manufactures, makes the question of freight of interest to every inhabitant of the kingdom. Our food cannot come here without sea-carriage; this cannot be provided without the payment of adequate freights. It is, therefore, matter of common interest to inquire—what must freight cover? what items do really enter into its cost? and what has the payment called freight to provide?

In the first place, freight has to provide for the building, maintenance, depreciation, and ultimate loss of the ship itself. If freight were not adequate for all these purposes, sea-carrying would not be continued as a trade. No capitalist would invest money in the building or buying of ships unless he expected on the ultimate loss or sale of the vessel to find his original capital in hand, plus something more than 3 per cent interest for the time of the investment, otherwise the money had better have been put into consols or railway debentures. No one invests in very troublesome and precarious trades but for the hope that at the end of the adventure they would find not the capital only, but interest at a higher rate than that yielded by investments which give no trouble, and are practically without risk.

In the second place, a ship is only a tool; a tool moreover which demands the constant employment of labour for its use. It must be prepared and outfitted for every voyage. To the outfit of stores and provisions nearly every trade makes contributions. To load cargo, docks and harbours are necessary; their cost must largely be provided out of freight. Captains, mates, engineers, firemen, and seamen, all must be paid wages, and fed while at

sea. The light and pilotage services round our coasts are also paid for out of freight, these being special charges on shipping. When the vessel comes back with her cargo, the same charges have all to be paid again. Freight, therefore, may be said in one sense to be a very large employer of labour. Large classes of labourers on shore, as well as the seamen afloat, live out of it, and freight must be sufficient to bear the cost of all these charges.

The student of economic facts will be prepared to hear that great changes have taken place with regard to all these elements in the cost of freight in late years. Ships were formerly built of wood, then of iron, now almost exclusively of steel. Steam propulsion, excepting in the very long trade voyages, is rapidly superseding the use of sails. To build wooden ships we had to depend on imported timber. For iron and steel ships, the raw material in vast quantities lies under our feet in the iron and coal measures, a percentage only of iron in the ore or plates being imported. The cost of shipbuilding is less than formerly. That of maintenance is about the same. That of structural depreciation is not less. It used to be thought that iron structures would last indefinitely. But the vicissitudes of climate and other things have modified this opinion. Since the early years of steam changes in requirements of size, type, and speed have rendered many vessels useless, in an economic sense, long before they were worn out. To cover the risk of becoming obsolete, inevitable outlays on surveys, on new boilers in the case of steamships, and depreciation between old and new, about 10 per cent of the original cost must be set aside annually to secure replacement of capital with reasonable interest. This, of course, must be borne by freight. Since the introduction of triple expansion engines about 1885, no improvement of the first importance has been made in steam, and it may be assumed that, excluding the possible advent of some invention as far reaching in its effects as triple expansion, a depreciation of 4 per cent to 5 per cent is now sufficient.

It is probable that the costs of navigation have decreased. Wages are higher both for seamen and on shore; but so much steam is used to economise labour, that in spite of higher pay to the men actually employed, it is probable that this item in the cost of freight is less than formerly. Insurance is probably cheaper, in most cases it certainly is so.

None of these items, however, are so changed as to explain the largely reduced cost of freight. Limiting our view to the last forty years, which mark the time within which steam began to be used for ordinary cargo-carrying, the reduction is very large. It is difficult to state it in figures. The short-voyage trades necessarily show the least reduction, because freight on these includes the labour of loading and unloading, of light and harbour dues, etc., so frequently; and these items are higher than formerly. But in the long-voyage trades reductions to below a third of the former rates of freight are quite common. If the comparison be extended to sixty or seventy years ago, many freights would be found at less than one-fourth what they were then. They still fluctuate much, with variations in crops and seasons, and are affected sometimes by wars and famines; but apart altogether from such exceptional causes, the permanent level of freight is lower in the proportion stated. Two causes have led to this: (1) The shortened time of voyages by the use of steam. Coasting voyages which frequently occupied a month now occupy less than a week. Mediterranean voyages that used to occupy five or six months are now completed in two. Indian voyayes, *via* the Cape, by sailing ships, which frequently occupied ten, eleven, and twelve months, are now frequently performed by cargo steamers in three, and seldom exceed four months. (2) The greatly increased size of the vessels. Cargoes of 4000 tons are as common now as those of 1000 tons before the use of steam; and cargoes of 5000 to 7000 tons are becoming frequent. These larger bulks can be carried at greatly reduced rates. The large steam vessels of to-day can make profits out of rates of freight on which either the small steamships or the large sailing ships of former times would have made large losses. These two are the chief factors in this great reduction in the cost of freight. Steam has saved time, and the growth of business has made it economically possible to carry in larger bulks.

We have recently been passing through a remarkable revolution in all that related to freight. The material of the vessels, the method of propulsion, the speed, the size, have all changed, and all have conduced to the reduction in the cost of freight already mentioned.

The economic effects of this change are very considerable already, but are probably more far-reaching than anything apparent yet. Men used to live where their food was grown, and were limited in their numbers to the local means of subsistence. Cheapened freight has made maritime distance of very small account so that millions of human beings in these islands are living thousands of miles away from the localities in which their daily bread is grown, without any sense of risk or insecurity. Indeed, they are better off than their fathers, who had to live on what was locally grown, whether it was a bad crop or a good one; but now, if the local crop is either bad or short, it makes very little difference in the price though a great difference to the grower, so cheap and good and constant is the over-sea supply. Cheapened freight, therefore, may be said to have modified

the operation of the Malthusian law in an important degree, for the time at all events, by bringing the surplus food production of the most distant countries to our markets, at constantly decreasing prices, 42,000 000 of people in these islands, being now fed with far cheaper, and generally better bread, than half the number formerly.

This would be an important matter if it affected our own state only. But other states are following in our steps, and in spite of duties more or less prohibitory, find it impossible to keep out of their ports the cheaply produced grain of distant lands, carried by English steamers at little more than nominal freight. There is no record of these transactions between foreign states in our board of trade and navigation returns; but the quantities of food carried under our flag to Germany, Holland, France, Belgium, Norway, Sweden, Spain, and Italy are very large indeed. When the sea freight has come to be less in many cases than the cost of inland transport from one part to another part of the same kingdom, it is easy to see how large coast populations begin to draw on the over-sea supplies, which are found cheaper than the home-grown food.

Whether such a state of affairs will last it is impossible to say. Will men go to live where the food is grown? or will they continue to depend on cheap freight for bringing the treasures of other climes to consumers here. This is a new state of things, and one of the very remarkable effects of cheap ocean carriage.

It is only necessary to allude to one other fact connected with freight. Though so much cheaper than in earlier years, the transactions are so large as to have furnished economists with one of the chief factors in making up the difference between the apparent value of our imports and exports. Twenty years ago there was much concern at the growing gulf between these two values. We were reminded of the dividends the United Kingdom had to receive from abroad as partly explaining the difference, but they were not an adequate explanation. All further anxiety on the matter was disposed of when it was shown that the import value included the freight, and had to be reduced by the amount thereof, also that the export value, in most cases, also required that the freight should be added, because both freights were earned so largely by the English flag, *i.e.* by Englishmen working in English ships, and constituted as real an export value as any other item of export that appeared in the trade returns. It was happily called "an invisible export," the value of which being duly deducted from imports and added to exports, explained the manner in which the apparent excess of imports was paid for. J. G.

FREIGHT, Dead, and other terms. See Freight.

FREIGHT IS THE MOTHER OF WAGES. This maxim, which means that unless a ship earns freight the sailors are not entitled to wages, has ceased to be applicable in the United Kingdom since 1854, by the Merchant Shipping Act of that year, providing by § 183 that "no right to wages shall be dependent on the earning of freight," subject, however, to the reservation that a sailor's claim is to be barred if it can be proved "that he has not exerted himself to the utmost to save the ship, cargo, and stores." Any attempted modification of this provision by private agreement is wholly inoperative (see § 182). Previously to the statutory abrogation of the old rule, the Courts had already engrafted many exceptions on it, and it was never applied to the master of a ship (see Hawkins v. Twizell, 25 Law Journal (Q. B.) 160); but it seems strange that a rule so inhuman and unjust should have been allowed to remain law for such a long period.

According to French and Italian law a sailor was not entitled to wages in case of capture or total loss of the ship and goods (Code de Commerce, § 258 [unamended]; Codice di Commercio, § 235), but as regards France this rule was, in 1885, altered in favour of the sailors; and in the case of loss of freight for other reasons, the codes of both countries always upheld the sailors' claims in the absence of express stipulations to the contrary.

According to German law, a sailor belonging to a ship which has been lost is entitled, not only to the wages earned up to the date of the loss, but also to the expenses incurred in returning to the port from which the vessel started on its voyage.

[As to the present state of English law on the subject, see Maclachlan, *Law of Merchant Shipping*, 4th ed. 1892. — Abbott, *Law of Merchant Ships and Seamen*, 14th ed., 1901 (see also the report of Cutter v. Powell in Smith's *Leading Cases*).] E. S.

FRENCH SCHOOL OF POLITICAL ECONOMY.

Period I., p. 154; Period II., p. 156; Period III., p. 157; Period IV., p. 158.

A survey of the French school, from its commencement to the present time, will show that it has passed through four successive phases, which are clearly marked off one from the other, and form the natural subdivisions of this article.

Period I. (1615-1803).

During this first period, which may be termed the period of the foundation of economic science, France may assuredly be said to have taken a more important part than any other country. With the increasing interest felt by economists in the history of economic doctrines, and with the greater amount of study they bestow upon the older authors, more and more ample justice is paid by them to the great ser-

vices rendered in the past by the French school. It might be said that nowhere else has political economy had a larger number of precursors.

It is now generally agreed that it was in France that political economy first saw the light and even received its name; for the first book bearing the title of *Économie Politique* is that by Antoine de MONTCHRÉTIEN, *Traicté d'Économie politique*, 1615. (This fact is specially admitted by Cossa, on page 61 of his *Introduction to the study of Political Economy*, English translation). Unfortunately the title of Montchrétien's book is practically the only portion that has deserved to survive, but that was certainly a beginning. What, however, may be held to be the first systematic treatise on political economy is the *Essai sur la Nature du Commerce*, by Richard CANTILLON, which, although not published till 1755, was obviously written before 1734, since that was the year of his death. In this work nearly all the subject-matter of modern political economy is dealt with in a most clear and definite manner. A new edition has just appeared, with a preface by Mr. Higgs, who, in the *Quarterly Journal of Economics* (July 1892), writes that "good reasons might be given for regarding him as the father of political economy without putting any strained interpretation upon the phrase."

Questions concerning money and taxation greatly attracted the attention of the early French economists, probably by way of reaction against the debasement of the coinage habitually practised by the kings of France, and against the unjust privileges in respect to taxation which characterised the old régime. Thus, long antecedent to Antoine de Montchrétien, deep in the middle ages, just half way through the 14th century, Nicolas ORESME, bishop of Lisieux, the tutor of Charles V., wrote a treatise entitled *Tractatus de Origine, Natura, Jure, et Mutationibus Monetarum*, of which Professor Ingram has been able to say that it "contains a theory of money which is almost entirely correct according to the views of the 19th century" (Ingram, *History of Political Economy*, p. 36). In this Bishop Oresme protests boldly against the alterations in the value of money made by the king—these he terms a "fraudulent act" (*actio fraudulenta*). In the same way two centuries later, during the time of the serious rise in prices which characterised this epoch, BODIN was the first to give the scientific explanation of the causes which led to this, in a memorandum written in 1568, showing that the enormous importation of gold and silver in Europe depreciated the value both of the precious metals and of the money. Finally BOISGUILBERT, in the *Détail de la France* (1692), made this bold statement respecting money: "It is very certain that money is not a value in itself, and that its quantity adds nothing to the wealth of a country." With regard to taxation, those writers whom we have just mentioned, Bodin and Boisguilbert, both insisted that taxation should be proportional, and that the exemptions in favour of the nobility and clergy should be suppressed. We must join with these the illustrious Marshal VAUBAN, who in *La Dîme Royale* (1707) proposed the abolition of all the existing taxes, and the replacing them by one single tax "charged proportionally on all who possessed an income." In writing on these subjects Vauban was the first to employ statistical documents; these had been collected by himself, and are almost the only ones we possess referring to that epoch.

A short time before the date of the PHYSIOCRATS, a man who is perhaps best known to us by the encomium pronounced by TURGOT on him, Vincent de GOURNAY (who died in 1759), drew up the programme of the "liberal school." To him also has been attributed that famous saying *laisser-faire, laisser-passer*. Whether this is true or false, it is certain that it was he who promulgated the view that, since private interests concurred with public interests, the best thing, from the point of view of the advantage of the public, was to let every one follow his own way in life.

Full justice, too, is nowadays awarded to the genius of QUESNAY and to the merits of his disciples MERCIER DE LA RIVIÈRE; DUPONT DE NEMOURS; LE TRÔSNE; TURGOT (see all these), that illustrious body of men who first bore the name of ECONOMISTES, and were in the main much in advance of their time. Universal tribute is paid to their praiseworthy endeavours to form a vast synthesis of economic facts, and to their skill in deducing from a few principles a large concourse of individual items of knowledge, the very characteristic of the formation of a new science. Although they did much to make plain the notion of wealth, still it was not "wealth" but the "natural order of society" that they regarded as the subject of the new science; perhaps, indeed, their conception was more correct than that of Adam SMITH. There is no need here to analyse the physiocratic system, for that will be treated of in a special article in this Dictionary. All that is required here is to assign to the physiocrats their place in the history of the French schools (see EPHEMERIDES; PHYSIOCRATS).

Great indeed was their influence over Europe: every one knows their relations with the Margrave of Baden (whose correspondence with MIRABEAU and Dupont has lately been published) (see KARL FRIEDRICH); with Leopold, Grand Duke of Tuscany, afterwards Emperor of Austria; with Gustavus III. of Sweden; with Stanislaus, King of Poland; and even with the Empress Catherine of Russia. Moreover, these relations were not purely literary, but also had

a beneficial influence over the laws of the countries above mentioned. In France, their influence on legislation might have been expected to have been even greater, seeing that one of the most illustrious of their number, Turgot, was minister of state. As a matter of fact, in his edicts with regard to the abolition of the restrictions on the movement of grain, of the exclusive trade corporations and of forced labour, Turgot did not fail to apply in all their integrity the principles of the physiocrats. However, most of these reforms came to nothing—perhaps because he applied these principles too hastily, or as a philosopher rather than as a statesman; or because the resistance to them was too powerful for the weak hands of Louis XVI. to overcome.

The Catholic school has bitterly reproached the physiocrats for having by their teaching prepared the way for the French Revolution; it might be more correct to say that had these doctrines been applied, there would have been no necessity for the revolution. The influence of the physiocrats has been less powerful in the sphere of science than in the region of legislation, partly because the glory of Adam Smith caused them to be forgotten, partly because even in France their successors have treated them with excessive disdain. But their influence over Adam Smith, and through him, indirectly, upon the general evolution of the science, cannot be gainsaid, though even now not sufficient light has been thrown upon it. The classical school, at its first introduction, encountered two important opponents—both heretics in the opinion of those who held to the doctrines of the school—the first one, FORBONNAIS (*Principes Économiques*, 1767), who defended the protectionist system, the other the philosopher CONDILLAC, who in his book on *Le Commerce et le Gouvernement* (1770) criticised several of the doctrines of the physiocrats, notably that on value, as to which he develops for the first time a psychological theory closely approaching the one so celebrated at the present day under the name of the theory of "FINAL UTILITY."

A place amongst the founders of political economy must be reserved for Jean Baptiste SAY, not indeed on account of the originality or depth of his ideas, but simply because he was the author of the first really popular work on political economy. His *Traité d'Économie politique* (1803), which was wonderfully well arranged and lucid, was translated into many languages, and thus made the new science accessible to all classes of society. Nor was he simply a mere populariser; he gave economic science its present form and its definitions;—from his categories, his vocabulary (*e.g.* the term "ENTREPRENEUR," which has been borrowed by most other languages), and his great divisions of the science, has been constructed the scale it was henceforward to work by. The classifications which he planned, the impress he stamped on the science has been reproduced in every text-book published during this century.

PERIOD II. (1803-1848).

In this second period the series of economists received a strange interruption. During more than forty years economic science in France underwent an almost total eclipse. From Jean Baptiste Say's work (1803), which we have just referred to, up to DUNOYER's publication (in 1845) of his book on *La Liberté du Travail*, no economist can be mentioned who created a school. No doubt there were several works of some merit, but they dealt rather with subjects bordering on political economy than with the science itself. Amongst these are the treatises of DESTUTT DE TRACY (1823) and of Joseph DROZ (1829), which were strictly speaking the writings of a philosopher and a moralist; the *Systèmes de Culture* of Hippolyte PASSY (1846), which treated of rural economy; COURNOT's even more important work, *Recherches sur les principes mathématiques de la théorie des richesses* (1838), which is an early instance of the application of mathematics to political economy,[1] and VILLERME's *Tableau de l'état physique et moral des ouvriers* (1840); this last is an excellent statistical study. There was a sudden break in the series of great didactic works, while contemporaneously it continued in England. No account can be taken here of STORCH (*Cours d'Économie politique*, 1815, and *Considérations sur la nature du revenu national*, 1824), since his work lay outside France; of ROSSI (*Cours d'Économie politique*, 1840), since he was an Italian; or of SISMONDI (*Nouveaux principes d'économie politique*, 1819), since he was a Swiss; indeed the latter could in no case be counted as an economist of the classical school, inasmuch as he was their vigorous opponent.

In truth, if the classical economists disappeared from sight in the period now under review, the reason was that they were replaced by their foes, the socialists. The period is filled with the names of Saint-SIMON, FOURIER, PROUDHON, Louis BLANC, and of such writers, less known than they deserve, as BAZARD, ENFANTIN, LEROUX, BUCHEZ, VIDAL, and CABET. These men attracted general attention and drew the thoughts of all men towards them. It is the fashion nowadays, especially with

[1] Cournot "taught that it is necessary to face the difficulty of regarding the various elements of an economic problem—not as determining one another in a chain of causation, *A* determining *B*, *B* determining *C*, and so on—but as all mutually determining one another. Nature's action is complex, and nothing is gained in the long run by pretending that it is simple, and trying to describe it in a series of elementary propositions."

[Marshall, *Principles of Economics*, vol. i., in his preface to the first edition bears a high tribute to the ability of Cournot . . . "Cournot's genius must give a new mental activity to everyone who passes through his hands," p. xv. Macmillan, 2nd ed., 1891.]

socialists of the German school, notwithstanding their obligations to it, to turn this socialism, which they term "utopian," into ridicule. But in my opinion, when the history of socialism and of its first beginnings receives the same amount of attention as the history and origins of political economy have received, the French school will be found to have taken, in the creation of contemporary socialism, a share equal, or even superior, to that which it had in the formation of economic science. No doubt there was much that was utopian in the exuberant blossoming of ideas that characterised this period; but many of them have borne fruit and have taken their place in what is now called scientific socialism. The notion that man, as a member of society, has functions to fulfil rather than rights to exercise (in direct opposition to the revolutionary programme of the "Rights of Man"), forms the basis of the teachings of Saint-Simon. In the writings of his follower, Bazard (*Doctrine de Saint-Simon*, 1828-29), there is a perfectly clear exposition both of the social question of the present day, *i.e.* the separation of the labourer from the instruments of his labour, and of the solution proposed by the collectivist school, *i.e.* the nationalisation of the instruments of production. Again, never have the advantages of co-operative association for purposes of consumption been analysed with more precision, and never have the disadvantages of the increase of "middlemen" been more vigorously assailed, than in the works of Fourier (*Association Domestique Agricole*, 1822). The theory of the "Iron Law" (*loi d'airain*), and the proposition destined to become so terrible a weapon in the hands of the Marxists, namely, that wealth is the product of the *labour of others*, are plainly set forth in Vidal's *Répartition des Richesses* (1846). In 1831, twelve years before the Rochdale Pioneers, Buchez founded the first co-operative society for production, as a means of social transformation, and suggested as the aim of the working classes that system of *collective saving* in the shape of a reserve fund, in preference to the method of individual saving, which is the characteristic feature of trades unions. Of the unreadable writings of Leroux but one word survives; yet it, the term *solidarity*, shines out as a guiding star. Proudhon's confused and vehement reasonings (*Qu'est-ce que la Propriété?* 1840;—*Système des Contradictions Économiques ou Philosophie de la Misère*, 1848) have been, perhaps, of little special value to the doctrine of socialism; but they have rendered a very real service to economic science by obliging it to examine and to consolidate the foundations of political economy, which till then had been regarded as unshakable. The *Système*, however, is memorable as having called forth Karl Marx's taunting reply *La Misère de la Philosophie*.

Auguste Comte, also, should not be counted as a socialist, but at any rate he must be placed amongst the opponents of the economists; they have never forgiven him for the contempt he poured on them and for his assertion of the absolute uselessness and irrationality of endeavouring to make political economy an independent science. Perhaps Mr. Ingram goes a little too far in saying that Comte, the founder of sociology, was also the founder of the historical school of political economy.

Never has France, and Paris in particular, shone more brightly in the world, or exerted more influence over the socialistic movement, than in the period which ended in the Revolution of 1848, an event, indeed, that nearly set all Europe in a blaze. That influence spread on the one side to America, where communities were founded after the fashion of Fourier's phalanstery, and in the other direction to Russia, exiles from which country, the future chiefs of anarchism (*e.g.* Herzen and Bakounine), came to Paris for instruction.

Period III. (1848-1878).

This third period is in striking contrast to its predecessor. The socialists vanish from the scene and are not again spoken of; never before has any school of thought seemed smitten by so sudden a death. The following passage occurred in the article on the "Socialists" in the *Dictionnaire d'Économie politique* which appeared in 1853: "When we state that socialism, at any rate in its recent shape, is altogether extinguished, there is no fear of our assertion being falsified either by the course of time or by future events." A sufficient explanation of the phenomenon lies in the failure of the revolution of 1848 and its replacement by the second empire.

On the other hand, the classical school of economists, who had never been heard of during the second period, sprang up on every side. This fresh movement had already been begun by Charles Dunoyer's book in 1845, but the liberal and optimistic traditions of the French school were first renewed, with remarkable energy, by Frédéric Bastiat in his *Harmonies Économiques*, published in 1850, the year of his death. The final triumph of the orthodox and liberal school was effected by many authors. Mention may be made of the numerous writings of M. Michel Chevalier, the series of which had commenced in the preceding period with his *Cours d'Économie politique* (1842-1844), and comprised *La Monnaie* (1850), *Le Système protecteur* (1853), and *La Baisse probable de l'Or* (1859). In 1852 and 1853, MM. Coquelin and Garnier issued the *Dictionnaire d'Économie politique;* in 1855 came M. de Molinari's *Cours d'Économie politique;* in 1857 M. Baudrillart's *Manuel;* in 1858 M. Courcelle Seneuil's *Traité d'Économie politique;* in 1861 M. Frédéric

Passy's *Leçons d'Économie politique;* and in 1867 M. Levasseur's *Précis d'Économie politique.* Indeed, all those liberal ideas which had been proscribed by Napoleon III. appear to have taken refuge in political economy, and to have breathed into it a new life.

The opinions of the economists of this period do not differ materially from the tenets of the "MANCHESTER SCHOOL," *i.e.* free trade, distrust of state interference, and monometallism. However, Stanley JEVONS observes that the French school is less dogmatic in its ways than the English school, and with reference to "the doctrine of wages," for example, he observes, that the true doctrine may be more or less clearly traced through the writings of a succession of great French economists, from Condillac, Baudeau, and Le Trôsne, through J. B. Say, Destutt de Tracy, Storch, and others, down to Bastiat and Courcelle-Seneuil. "The truth is with the French school."

Indeed, in the hands of the French school political economy becomes a natural rather than a deductive science. In spite of their disinclination to acknowledge their debt, French economists have remained faithful to the traditions left them by the physiocrats. They frequently take a delight in contrasting the generous and idealistic spirit of their school with the egoism and mercantile tendency of the English school. Perhaps this contrast is less real than they suppose it to be. As a matter of fact their egoism is as great as that of the Manchester school, the difference being that their temperament is light-hearted, whereas that of the English economists may be regarded as sombre; in short, the latter are pessimists, the former are optimists. OPTIMISM, indeed, has been the characteristic feature of the French school ever since the days of the physiocrats even to our own time; the fullest expression of this is found in Bastiat. It may be defined as a belief in a natural order which regulates human society, and, though not exempt from certain disorders, is still, human nature being as it is, the best possible. Moreover, this natural order of things is capable of indefinite improvement through the unfettered action of liberty and of competition. Beyond this lies the conviction that no attempt to modify the machinery of the system should be made, and that all that is necessary is the removal of the obstacles that might impede its due working.

And if this school in a general way rejects the English theories respecting rent, wages, and population, this arises from the idea (*idée a priori*) that the discouraging consequences of these theories enhance the difficulty of the justification of the existing social order.

During this period there were but two dissentient economists. The first of these, WOLOWSKI, indeed, separated himself from the school only on a question of detail, *i.e.* bimetallism, which he warmly advocated in his *Liberté des Banques* (1864), and in his *L'or et l'argent* (1870). The other was LE PLAY, who wrote *Ouvriers Européens* (1855), and *La Réforme Sociale* (1864), and founded a school,—the first, indeed, to branch off from the parent stock. Still, Le Play, and his followers in a marked degree, continued to adhere to the liberal school in their distrust of state interference, and in their apologies for the "essential principles" of our present social organisation, including competition. Le Play, however, abandons the optimistic standpoint and the deductive method; he desires a "reform," and strives to find the elements of such a reform in the observation of facts, especially in the study of the family life of the working classes.

During this period the influence of the economists was so great that it could not fail to penetrate into the sphere of legislation. It is well known that Michel Chevalier negotiated, together with COBDEN, the famous treaty of commerce of 1860 between France and England, which inaugurated an era of modified free trade not only for France but also for the rest of Europe.

Protection was believed to be as completely stamped out as socialism. The conviction of this double victory contributed largely to the maintenance of the proud self-confidence of the orthodox school. Credit may also be given them for the law of 1864, which abolished the penalties attaching to the right of combination between workmen. In accordance with their principles the economists had always admitted that combination was "the natural, regular, and legitimate means of resistance afforded to the working classes by the system of free competition" (*Dictionnaire d'Économie politique, sub voce* "Coalition"). They had also no small share in the development of the French railway system (the conventions of 1859) and of joint-stock companies (the Act of 1867), and in the formation of the great international exhibitions of 1855 and 1867, in which important parts were played by Michel Chevalier and Le Play. Further, Le Play endeavoured to procure the enactment of a measure granting freedom of disposition of property by will, at least up to a certain point; but in spite of the support of Napoleon III., the bill failed to pass through the Chamber, for it was in too flagrant contradiction with the "principles of '89."

In this period the liberal French school reached its apogee, but it was also approaching the commencement of its decline, or at any rate, the end of its uncontested supremacy. The conflict between the liberal school and its rivals occupies the fourth and last period, on which we are about to enter.

PERIOD IV. (1878-1892).

The date from which this last period should

be reckoned is necessarily to some extent undetermined; the year 1878 has been chosen, since it marks an important event that we shall presently discuss, that is to say, the rupture between university education and the orthodox school.

During the time we are now considering, most of the leading economists of the preceding period still bore on high the banner of the liberal school, MM. de Molinari, Frédéric Passy, and Levasseur. Michel Chevalier, Baudrillart, and Courcelle-Seneuil have gone, but their places have been filled by MM. Leroy-Beaulieu, Block, Léon Say, and De Foville, and taking all in all, the liberal school contains as many men of high ability as ever it did. This school is in exclusive occupation of the benches of the Institute and of the professorial chairs at the various schools of Paris. The venerable *Journal des Économistes* has received as companions the *Économiste français* (1873), edited by M. Paul Leroy-Beaulieu, and the *Monde Économique* (1891), edited by M. Beauregard, Professor in the Faculty of Law at Paris; both of these organs uphold the same cause. A new *Dictionnaire d'Économie politique* (1890-1892) has appeared under the care of MM. Léon Say and Chailley; it is written in the same spirit as the former one. To all outward appearance, therefore, things would seem to be as they were; but in reality there have been great changes. The liberal school has lost the public ear and the legislative support that it possessed in the preceding period. It is hated by the working classes, who upbraid it for its quietism; by the agriculturists and manufacturers, who have never forgiven it for free trade; by the Catholics, who regard it as the embodiment of the principles of the Revolution, and whom the very name of liberalism irritates; and, last of all, by the radicals, who are hastening on towards state socialism. From every side rival schools are rising, all of which are preparing for the conflict by starting their own "Reviews."

Le Play's school, which grew in importance after the disasters of 1870, formed groups in all parts of France termed *Unions de la Paix Sociale*, and in 1881 founded a fortnightly review, the *Réforme Sociale*, which abstains from all theoretical subjects, but is one of the best publications for the discussion of all questions relating to economic legislation. Its chief representative in France was M. Claudio JANNET, whose most important work is *Le Socialisme d'État et la Réforme Sociale*. M. Demolins, author of *À quoi tient la supériorité des Anglo-Saxons*, and editor of the review *La Science Sociale*, also claims to be a direct disciple of Le Play, though disowned by the main body of the school. For all this, Le Play's school is a rival rather than an enemy of the liberal school; indeed, it is almost as liberal, but its apologies are made less for things as they are than for things as they were.

But by the side of Le Play's followers another Roman Catholic school has risen, of a far more pronounced religious character, which is the representative of what we have now agreed to call Christian socialism, in spite of its energetic repudiation of the epithet "socialistic." It is very bitter, as vehement indeed as the socialists themselves, in its criticisms of the economic organisation of the present day, especially of *laisser-faire* and competition, and is much inclined to fall back upon the State, which it terms the "Minister of God." Its organ is *L'Association Catholique*, a monthly review that was founded in 1876, and its most eloquent spokesman is the Comte de Mun, a member of the Chamber of Deputies. Further information on the subject may be found in M. Urbain Guérin's *L'Évolution Sociale* (1891).

Again, a new lease of life had been taken by the socialist school after the termination of the Paris Commune of 1871, and around this revolution a great "socialist legend" grew up, its two chief apostles being Jules Guesde and Lafargue, Karl Marx's son-in-law, who were for some years members of the Chamber of Deputies. These two represent collectivism of the Marxist variety. M. Benoit MALON, the editor of the *Revue Socialiste* (started in 1885), author of a number of books, the chief of which is *Socialisme Intégral* (1890-1892), clings more closely to the traditions of the socialism of the French species, which is less materialistic, and holds that the matter of "filling one's belly" does not exhaust the whole social question, and has to-day for leader M. Jaurés of the Chamber of Deputies.

In 1878 the event occurred that I here referred to as the starting-point of a new period, namely, the institution, at all the universities in France, strictly speaking, in their faculties of law, of professorial chairs or lectureships of political economy, which duly appear on the official schedule of education and examination. Till then political economy had been taught only in the special schools at Paris, and at the Collège de France. Instruction in this subject was given entirely by a small number of economists, all of the same school, sometimes of the same family, and lecturing in the same city. Naturally, therefore, the teaching of political economy became a sort of monopoly and received that restricted and almost sectarian tendency which has thrown it into discredit. When in the year 1825 Jean Baptiste Say wrote in the preface to the *Traité d'Économie politique*—"Nowadays political economy is taught wherever knowledge is valued. It has already had professors in the universities of Germany, Scotland, and Italy";[1] little did he think that as far as regards French universities his

[1] In speaking of Scotland Say was thinking, no doubt, of Adam Smith, Dugald Stewart, etc. The "chair" of Edinburgh is of later date (established in 1871).

wish would take more than half a century to realise.

The new professors of political economy in the faculties of law did not all of them secede from the orthodox school; for instance, M. JOURDAN (who died in 1891) and M. Villey still adhered to the principles of the liberal school, but in some instances the rupture was immediate. This was especially the case with M. Cauwès, who lectured on political economy in the faculty of law at Paris, and who occasioned much commotion by the publication in this very year, 1878, of his *Cours d'Économie politique*. The cause of irritation lay in his avowing the same scepticism as De LAVELEYE with regard to natural laws, and his inculcation of LIST'S theories on protection. In 1887 one of the new professors (Prof. Gide) took the lead in founding the *Revue d'Économie politique*, which received the support of all the professors in the various faculties of law, and of a large number of professors at foreign universities, particularly in Germany, who till then had received practically no hearing in France. The aim which the founders of this organ had in view was not exactly to form a new school, but merely, to use their own words, "to open out a neutral territory on which both doctrines and facts might be studied and compared with one another." As a matter of fact, they are being more and more drawn into the sphere of attraction of the historical school, and also of state socialism.

Further details on this last period may be found in the writer's article on "The Economic School in France," in the *Political Science Quarterly* (vol. v. No. 4).

Our survey would be incomplete if we failed to mention a large number of publications that propagate either socialistic ideas or protectionist principles; such notions are not confined to special organs, but are set forth in a whole host of political newspapers. To these might be added purely literary works, such as those of Zola, Cladel, and Rosny, which resemble the writings of George Sand and Eugène Sue half a century ago, in spreading socialistic ideas far and wide.

Naturally enough legislation has been affected by this change of front by the French school. The treaties of commerce which were negotiated between 1860 and 1870, under the auspices of the free trade school, have now been denounced by French lawgivers, and an exceedingly protectionist customs tariff has been imposed. Concurrently with this large numbers of bills, most clearly marked with state socialism, have been laid before parliament, sometimes by private members, sometimes by the government. One bill, which has become law, limits the hours of labour for children and women. Others purpose a great superannuation fund for workmen; to grant certain privileges to workmen's syndicates, such as the dispensing of the giving of securities in competing for public works; other proposals forbid employers, under severe penalties, to dismiss any workman on the ground that he is a member of a union; to compel contractors for the execution of public works to introduce profit-sharing; another subjects the companies which work the coal mines to the rigorous supervision of delegates elected by workmen. The most recent school of socialism is that of *Solidarisme*, which seeks to hold the middle place between INDIVIDUALISM and COLLECTIVISM (see SOLIDARITY).

In this historical sketch of the French school we must not omit a reference to a special branch of political economy, in which this school has perhaps most successfully displayed its characteristic qualities—precision, order, and clearness, that is in treatises relating to finance and taxation. M. de Parieu's *Traité des Impôts* (1862) and M. Paul Leroy-Beaulieu's *Traité de la Science des Finances;* R. Stourm, *Le Budget;* Léon Say, *La Solution démocratique de la question des impôts;—Le Dictionnaire des Finances;* have deservedly attained the position of classical works throughout Europe. C. G.

FRENCH TREATY OF 1860. See COMMERCIAL TREATIES.

FRICTION IN ECONOMICS. In economic investigation, according to the classical view of it, abstraction is made from the mass of general human motives; and the effect of a selected few, or, as some have held, only *one*, of them is traced out first of all. One by one thereafter the elements, from which abstraction was made at the beginning, are restored to their place, and the conjoint effects of the conjoined causes are traced out with so much of accuracy as the case allows. But the degree of accuracy is not high, economic factors occurring as a rule in the midst of a very complex plurality of causes.

The disturbing effects of causes that are not economic, on the action of the causes that are strictly so called, may be regarded as an "economic friction."

Examples may be drawn not only from distribution and exchange but from production itself, especially if "laws of population" are to be included under that head. Not only the customs, but the vices, follies, and mistakes of men are accountable for economic friction. Economic tendencies, too, may be counteracted deliberately and advisedly by principles of morality, statesmanship, art, religion, or pedagogics. The favourite example of economic friction is perhaps taxation. If it be true (see Thorold Rogers, *Local Taxation*, Cobden Club pamphlet, 1886, p. 12), that taxes tend to stay where they are put, instead of being shifted where economic principles by themselves would have carried them at once, this is an undoubted case of economic friction. There is least of such friction perhaps in the

distribution of currency, and in the movements of capital on a great scale in modern business (see Bagehot's *Lombard Street*). There is probably most of it in wages and salaries, even in modern business, and in the agricultural rents and burdens of all backward countries and backward districts of advanced countries. Marshall's view of "long and short periods" (*Principles of Economics*, 1890, *passim*) would seem to involve that over a long period, in the major sense of "long," friction might be neglected. Some such conclusion is also implied in the view of Loria and others that in all history economical causes are supreme over all others. [Cp. Keynes, *Scope and Method of Pol. Econ.*, ch. iv. pp. 124 *seq.*, 1891; Loria, *La Constitution Sociale* (1893).] J. B.

Economic friction may further be described as the opposition encountered by the movements of capital and the inability of labour to meet readily the demand for work; and generally by all the circumstances which prevent economic forces from bringing about their natural effects the instant they come into operation. It is, for instance, matter of common observation that, though prices are affected by changes in supply and demand, they are not necessarily altered by these changes at once; and even when the effect on price can be detected, it is often not instantaneous, but gradual. The causes of friction are various, chief among them being the want of accurate knowledge. In the case of the demand for and supply of labour, this is an exceedingly important consideration, as also is the frequent immobility of labour. In the friction which affects the price of goods, want of knowledge often increases the delay experienced before matters are adjusted to meet new conditions. CUSTOM and HABIT, also, are factors in producing economic friction; prices, especially of valuable articles, where competition is restricted, do not move readily, no matter what change there may have been in the conditions of production or in the state of supply and demand. It is due, no doubt, to habit, or prejudice, that the effect of a new tax, or of the remission of an old one, though matters of universal knowledge, do not always reach the persons intended. The salesman and the manufacturer cannot always pass on an indirect tax to the consumer; nor can the owner of property always exact the full amount of a new rate from his tenant.

FRIEDRICH, MARGRAVE KARL. See KARL FRIEDRICH.

FRIENDLY SOCIETIES. Friendly societies may be defined as insurance societies based on mutual principles: they are the means by which small tradesmen and the working class provide against sickness, old age, and the expenses of burial. They may possibly be traced to the gilds of the middle ages, or, at any rate, the disappearance of the gilds nearly coincides with the rise of friendly societies; but practically they first became popular and important in this country at the beginning of the present century. The early history of friendly societies is a melancholy record of failures. They were constantly dissolved or becoming insolvent, through mismanagement, dishonesty, or other irregularity on the part of officers and members. So late as 1882 there were in workhouses in England no fewer than 3913 persons who had been members of friendly societies which had disappeared. But gradually a reform took place which may be summarised by saying that a system of premiums was substituted for a system of levies. These words call for explanation. A society on the levy system looks to its annual income to cover its annual expenditure, and any deficit is made up by a levy or contribution among its members. Now as the benefits of a society are mainly prospective, and as, therefore, the charges are lighter at first than after some years, this system clearly is not likely to secure permanence. On the premium system the probable charges in the future are calculated, and the annual payments scaled accordingly. The sheet anchor of this system is the valuation, which is made at intervals, generally of five years, and consists of an elaborate review of present position and liabilities of a society. It might be thought that the collection of averages of longevity and periods of sickness would by this time be sufficiently large to give an almost infallible guide; but, as a matter of fact, the circumstances vary widely in different cases. The prospects of a society depend on a vast number of conditions, as the habits of a population, the character of an occupation, etc.; so much so that it is the actual experience of the society which gives the best clue to its future. On the results of such a valuation the table of premiums is constructed and revised from time to time.

The simplest form of friendly society is that in which each member pays a weekly sum, and in return is supported during sickness, whilst at the end of every year the funds of the society, less a sum for a reserve fund, are divided amongst the members. Such a society clearly lacks most of the elements of permanence, but at the same time it serves a valuable purpose as an educator in habits of thrift. The ordinary "village club" goes a step farther, and aims at extending its advantages over a longer period. There is no division of funds yearly, and hence a greater stability, but this is often purchased at a considerable cost. The very permanence of the club invites a ruinous competition on the part of other clubs, with the result that premiums are lowered below the point required for solvency, whilst young men tend to form clubs of their own, thus breaking the succession which is essential to the con-

tinuance of a club: again, greater opportunities are given for dishonesty on the part of officers. It is not necessary to dwell on the various kinds of object, etc., which distinguish village clubs, some of which tend to become savings-banks rather than friendly societies. The difficulties in the way of the success of such clubs are partly met by county clubs. Of these the area is the county, and the management is generally in the hands of the clergy, magistrates, and others, with rules and premiums carefully framed to guarantee solvency. But these advantages entail considerable sacrifices. There is far less of the social element, which has a high educational value in the village clubs; the area is too large for any common interest in the management, and therefore there is none of the political training which self-governing societies give; it is too large also to ensure that thorough supervision by neighbours, which is essential in all cases of persons drawing sick allowances, to prevent malingering. As a result county clubs are not able to offer sufficient advantages to their members to compete with other clubs. The difficulty of finding an area sufficiently small to insure good supervision, neighbourly relations, and self-government, and yet large enough to secure good business capacity at the head of affairs, and sound general principles, is met by the affiliated orders, the largest of which are the Foresters and the Manchester Unity of Odd-fellows. The unit here is the lodge, which may consist of any number of members, is generally on a local basis, has its own officers, rules, etc., is independent both of control and of support. Above the lodge comes the district, a geographical grouping of lodges, and above the district the order, which comprises a general committee of management, elected by the various districts and lodges, officers of the order, etc. The relations between the order and the lodges differ in different societies. In some cases the order formulates principles, tables of premiums, etc., in others it takes certain business, *e.g.* life insurance or pensions, and treats it as a central rather than a local matter; in all cases it is ready with advice in the formation and management of a lodge, and the fact of such a body with large experience bringing pressure to bear on ill-managed lodges, being ready with friendly help in times of stress, and having an indirect control does much to promote sound management. In some cases the name of friendly society is applied to companies which for a fixed payment, weekly or monthly guarantee a sum in the event of death, and are commonly known as 'Collecting Societies." They differ from friendly societies in the following points: (1) They give no relief in sickness; (2) they have no common bond of union amongst the insured; (3) they have paid collectors and a hierarchy of officers, as agents and inspectors, but no self-government. In them, it has been said, "the officials are everything, the members are nothing." But although these societies do not fulfil the objects of friendly societies, we must be careful to avoid underrating their usefulness.

The history of the laws affecting friendly societies illustrates the attitude of government in this country towards combined independent effort. The original Friendly Societies' Act of 1793 (33 Geo. III. c. 54) was of a permissive kind. It granted certain advantages to such societies as had exhibited their rules at quarter sessions and had them approved. In 1829 by 10 Geo. IV. c. 56 the justices were supplemented by a barrister-at-law appointed for the purpose, to whom all societies seeking registration were to exhibit their rules for approval. In 1846 by 9 & 10 Vict. c. 27 the barrister was given the title of Registrar of Friendly Societies, and the justices were relieved of their duties in registration. In 1850 (13 & 14 Vict. c. 113) an attempt was made to give some certificate of solvency, but the distinction between "certified" and "registered" societies was abolished in 1855. In 1875 an act was passed (38 & 39 Vict. c. 60) as the result of a commission of inquiry which, with some amendments, is still law. By this act the definition of a friendly society is made as wide as possible, registration is facilitated, and the powers of the registrar are enlarged. The registrar can not only refuse to register, suspend, or cancel registration, but, at the request of the members of a society, he can interfere in its management, can order an examination of its affairs, and, if he think fit, dissolve it. He can also act as arbitrator in disputes between a society and its individual members. But his powers and his sphere of activity are strictly limited. The fact is still often overlooked, but should always be borne in mind, that registration is no guarantee of the soundness of a society. It ensures publicity and publicity only. It does not even imply that the tables, etc., of a society are after an approved model—the government have always declined the responsibility of putting out such a model. In the case of registered societies the government insists that certain rules should be carried out, that *e.g.* the management should be separated from the benefit branch, that annual returns and quinquennial valuations by skilled persons should be sent to the registrar, and failure to comply with these rules renders the officers of a society liable to prosecution, and the society itself to have its registration suspended or cancelled. Indirectly this cannot but operate strongly in favour of sound management, but the limitations of the central office may be gathered from the statement of the late chief registrar that he held himself precluded from communicating to a member of a society the fact of its insolvency, and from

taking any step to publish the fact. Briefly, the advantages of registration to a society are these:—It can hold property, can sue and be sued, can proceed against fraudulent officers summarily, has a first claim upon the estates of deceased officers, can invest in government securities, can be easily and cheaply dissolved, is exempt from certain, now inconsiderable, stamp-duties. Against these privileges must be set the following restrictions:—The rules must be according to an authorised pattern, must approximate *i.e.* to a prescribed type, the field of investment is narrowly limited, elaborate returns must be made to the chief office. The habit of registration is *growing*, the number of accurate returns increases steadily, the total number of societies now registered is in Great Britain and Ireland 29,543, but it is impossible to say what proportion this forms of the whole.

The relations of the state to friendly societies in this country have been of a uniformly permissive character. The state has never insisted upon registration, or upon uniformity of management, premiums, etc., among the registered societies, and it has given up the attempt to guarantee their solvency. It has assisted them in a variety of ways. It has always been ready to advise as to management, to facilitate procedure in prosecutions for fraud. It has given exemptions from taxation and pecuniary aid in the form of a rate of interest above the normal, but these have gradually lost importance. The chief assistance which it has given of late years has been the conduct of a rival institution in the annuity or insurance branch of the post-office, the development of which is strongly urged in some quarters. In France and Germany the action of the state has been far more extended. The tendency in France is to interfere with independent societies by legislation, in Germany to take over the whole business of insurance against sickness, funeral expenses, etc., and constitute a department of the administration to conduct it.

FRIENDLY SOCIETIES, THEIR NUMBERS AND CONSTITUTION. The statement of the successive enactments affecting friendly societies contained in the previous article shows that, however they may have varied in detail, the main principles of legislation have never been departed from since 1793. Thus there has been for more than one hundred years a recognition by the state of these voluntary bodies as worthy of encouragement, and in some sort of protection; but there has never yet been any attempt to restrain the free association of citizens for the purpose of mutual aid. The suggestion has often been made—why should societies be allowed to exist if they will not comply with certain conditions? but the wisdom of the legislature has always hitherto consistently rejected it. Hence registration has always implied the granting of facilities and privileges upon certain easy conditions, rather than the imposing restrictions and penalties; and the swing of the pendulum from one side to the other has been marked by an increase or diminution respectively in the number of societies registered. The act of 1793 was purely enabling; that of 1819 restrictive; that of 1829, and still more that of 1834, enabling; that of 1846, and still more that of 1850, restrictive; that of 1855 enabling, and that of 1875 somewhat restrictive. Under the enabling acts, registrations have been numerous; under the restricting acts they have been few. There is no doubt, however, that the formation of friendly societies goes on irrespectively of legislation; and that unregistered friendly societies abound during the periods of restriction. The act of 1875 still, in substance, regulates these societies, the Friendly Societies Act and the Collecting Societies and Industrial Assurance Companies Act, 1896, altering it in form only.

In the county of Middlesex alone nearly 1000 societies were enrolled within a very few years after the passing of the act of 1793, and the number in some other counties was almost as great. Altogether, between 1793 and 1855 as many as 26,034 societies had been enrolled. The act of the last-mentioned year provided for making annual returns to the registrar, and directed him to make an annual report to parliament. It was then ascertained that more than 800 of these societies had been dissolved, and that more than 700 were not for the purpose of assuring sick pay. Of the remaining 24,500 societies, nearly 3000 could not be found, leaving about 21,500 societies as presumably still in existence. An attempt was made to ascertain how long the various societies had been established; but only 3073 answered the question. Of these it appeared that more than 100 had existed for many years before the act of 1793, and that as many as 20 societies claimed to be centenarians by the middle of the 19th century.

Of the 21,500 societies, about 2800 were in Middlesex; 2045 in Lancashire; 993 in Staffordshire; 979 in Yorkshire; 874 in Warwickshire; 752 in Surrey; 681 in Devon; and 642 in Kent. They are thus found to have been distributed among the manufacturing and

agricultural districts; and in fact to have overspread the country, and to have met the wants of all classes of its working population.

A considerable number of the societies which existed before 1793, and took advantage of the act of that year to enrol their rules, are still in existence. They have in general only a small number of members; indeed, it was not unusual in the early days of friendly societies to limit the number. This was of great advantage in maintaining the friendly feeling which it was one of the main purposes of these societies to encourage among their members; and it gave rise to a sentiment very common among them, that the benefit of sick pay and even of funeral money should not be claimed except in case of necessity. By this means, many societies whose contributions would not have been sufficient to provide the benefits, as a matter of insurance, were able not only to meet all claims which the members cared to make upon them, but also to accumulate funds from year to year. In some of these societies members would introduce their sons, and the society would continue from generation to generation among members of the same families. This is particularly marked in the very interesting group of societies founded among the Huguenot settlers. Some of them were formed by a number of persons coming from the same town or village, as the society of Lintot, which originally consisted wholly of persons deriving their family origin from Lintot, and still contains many members who can trace their descent back to the original settlers from that district. Those excellent, laborious, and thrifty men, who created new industries for us, and gave the British workman many valuable lessons, were largely pioneers in the good work of establishing friendly societies also.

In the twenty years from 1855 to 1875 as many as 21,875 societies were registered, or an average of 1094 per annum. Some allowance has to be made, however, for duplicate registrations; when a society sent up for registration a complete set of rules, it was not always easy to ascertain whether the society had been previously registered or not. Under the act of 1855 all branches of societies were registered as separate societies. The act of 1875 has made a clear distinction between them, and contains various provisions against duplicate registry. Under that act, from 1876 to 1892, 4240 societies and 7995 branches were registered, being an average of 249 societies and 470 branches each year. There was thus a certain diminution in the new registrations, which became more significant when closely looked into; for a large proportion of the registrations of new societies were such as were exempt from the obligation of making a quinquennial valuation, the onerous but most beneficial provision which the act of 1875 introduced. Many were dividing societies; others were juvenile societies; and from both these classes valuations are not required. A dividing society, as it does not seek to accumulate funds, but to distribute them, does not look forward to the future, but contents itself with provision for the wants of the immediate present. A juvenile society, which consists wholly of members above one and under twenty-one years of age, is a mere resting-place on the way to membership of an adult society, and ought not to be permitted to accumulate funds, though many juvenile societies show a strong tendency to do so.

The efforts of the registrar have been directed, since the passing of the Act of 1875, to the gradual enforcement of its provisions relating to valuation, without bearing with undue severity on the societies. For this purpose, it has been necessary, after fair warning, to suspend and ultimately to cancel the registration of many societies, and to take proceedings against others and recover penalties. The result of these measures has been, that in each period of five years the number of valuations received and the number of grants of dispensation from valuation added together, have tended more nearly to reach the total number of registered societies known to be in existence. The results of the valuations have been such as to excite serious anxiety in the friends of the societies. Of 14,988 valuations, only 3122 showed a surplus; the aggregate of such surpluses amounting to £1,781,319, while 11,866 showed a deficiency; the aggregate of such deficiencies amounting to £10,734,515. This statement must not be misunderstood. It does not mean that it is necessary to raise more than ten millions of hard cash to make friendly societies solvent. It means that each society must materially diminish the benefits it promises to its members, and materially increase the contributions it exacts from them, besides raising a certain sum in cash, in order to make both ends meet. Assuming that the 11,866 societies in question had something more than 3,000,000 members, a contribution of £1 from each member, would raise about one-third of the deficiency, leaving the other two-thirds to be met by reduction of benefits and increase of contributions. It must be remembered, moreover, that the valuations themselves are mere estimates, founded on a great variety of hypotheses as to the liability to sickness and mortality and the rate of interest, and that a valuer who wishes to make things pleasant for a society may adjust his hypothesis to that view; while another may exaggerate the valuation deficiency by omitting to take into account favourable considerations that are essential to the true view of the society's position.

The societies with branches, commonly called the affiliated orders, though showing very considerable deficiencies, appear to be in a some-

what better position than the independent societies, in which latter term, however, are included many societies which are really branches of affiliated orders, but have done nothing since the act of 1875 was passed to constitute themselves legally so. The registered branches were then 11,242: of these, 2281 showed surpluses amounting to £874,679; and 8961 showed deficiencies amounting to £6,716,838. The societies registered as independent were 3717, of which 827 showed surpluses amounting to £658,252 and 2890 deficiencies amounting to £3,901,435. The collecting societies are not included in these figures. In speaking of branches, it should be understood that the insurances effected by each branch are not guaranteed by the central bodies of the orders, and that for financial purposes they are in the same position as the independent societies. This is almost universally true as regards the insurance of sick pay. For insurance of funeral money, branches are grouped into districts. In the largest and most progressive of the orders, the Manchester Unity of Oddfellows, an arrangement exists by which a lodge in distress may seek help from the district to which it belongs, and a district in distress from the central body of the Order. Other orders are also making strenuous exertions to reduce the deficiencies shown by the valuations of their courts and lodges. These bodies possess great advantages in their annual meetings for conference and discussion. To be the chief of an organisation having 600,000 members, and to be called upon to preside over meetings constituted of their delegates, is a distinction much coveted and an honour highly prized.

The following is a summary of Registered Provident Societies in Great Britain and Ireland at 31st December 1903:—

	No. of Returns.	No. of Members.	Funds.
BUILDING SOCIETIES—			£
Incorporated Societies	2,062	547,049	*51,250,058*
Unincorporated Societies	62	54,155	*14,947,169*
	2,124	601,204	*66,197,227*
FRIENDLY SOCIETIES, ETC.—			
Ordinary Friendly Societies	6,924	3,059,107	*15,877,330*
Societies having Branches	20,845	2,613,552	*22,542,147*
Collecting Friendly Societies	43	6,973,136	*7,220,932*
Benevolent Societies	73	24,964	*322,551*
Working Men's Clubs	870	224,882	*320,688*
Specially Authorised Societies	124	77,383	*586,660*
Specially Authorised Loan Societies	506	101,816	*711,789*
Medical Societies	96	325,057	*61,000*
Cattle Insurance Societies	56	3,667	*7,840*
Shop Clubs	6	10,618	*1,181*
	29,543	13,414,182	*47,666,118*
CO-OPERATIVE SOCIETIES—			£
Industries and Trades	2,086	2,091,978	*43,404,269*
Businesses	245	62,531	*816,214*
Land Societies	129	17,133	*1,149,408*
	2,460	2,171,642	*45,369,891*
Trade Unions	672	1,575,375	*5,260,186*
Workmen's Compensation Scheme	54	117,619	*181,432*
Friends of Labour Loan Societies	255	33,590	*258,303*
Total Registered Provident Societies	35,108	17,913,612	*164,933,157*

From statistics of about 1890 it appears that while the average contribution per member in an independent society, assuring both sick pay and funeral money, is about £1, in a branch it rises to about £1:11s., which seems to show that the affiliated orders are seeking to raise their contributions more nearly to the amount required to meet the benefits assured, and that they are able to give greater benefits than the independent societies. Of the £1:11s., about 4s. goes for management, or about 12½ per cent, which is a moderate proportion, and it implies that in general the officers receive a very low rate of remuneration. If it be assumed that the £1:11s. represents from one to one-and-a-half week's income of the member, it must be admitted that he obtains a considerable benefit by way of insurance at a sacrifice of a comparatively small portion of his revenue.

The relation of friendly societies to provisions for old age is a matter that has recently received much consideration. Statistics have been sought of the number of paupers who have been members of friendly societies, with a view to throw discredit on the societies by implying that they have failed in their purpose of preventing pauperism. The result is very small, when compared either with the whole number of paupers or with the whole number of members of friendly societies, and the inference drawn is not a sound one. The primary object of a friendly society is not the preventing pauperism in old age, but the providing relief to a man generally able to work, yet momentarily prevented from doing so by sickness. Some societies, it is true, have tables under which a definite annuity in old age can be purchased; and where that is the case, such tables are required by law to be certified by an actuary; hence these societies are in general well able to fulfil their contracts, and their members are not those who are found in workhouses. The other societies, which do not pretend to assure against old age, do not affect to provide against

pauperism, and are therefore liable to no reproach if their members become paupers. Many societies, however, without insuring old-age pay, insure sick pay throughout the whole of life; and by a lax interpretation, inspired by a benevolent sentiment, promise their members what is in effect a pension, though usually very small in amount. Such societies actually pay this pension under the name of permanent sick pay, until it is claimed by so many members, and so persistently, that the funds will not support the burden; and it is these societies which swell the number of failures. Sounder views on this point are being entertained by the leaders of friendly society opinion.

Of 3202 valuation returns received, 595 were from friendly and collecting societies, showing the following results:—

	Assets.	Liabilities.
	£	£
Number of members, 307,418.		
Funds	1,513,118	....
Present value of benefits	....	*4,749,353*
Present value of contributions	3,074,459	....
Other liabilities	....	*487,677*
Other assets	104,693	....
Aggregate of estimated surpluses in 168 societies	....	*169,653*
Aggregate of estimated deficiencies in 427 societies	714,913	....
Total	5,407,183	*5,407,183*

It will be observed from the above figures that of the total number of valuations received during the year from friendly societies, 72 per cent disclosed deficiencies, as against 28 per cent showing surpluses, and that the aggregate net deficiency amounted to £545,260. Hence it appears that the assets are less than the liabilities by 10·4 per cent. That is to say, taken collectively, the societies were, at date of valuation, in a position to pay 17s. 11d. in the £ of their estimated future liabilities.

In the collecting societies the rates of premium charged are high enough to allow of an inordinate expenditure, approaching and sometimes exceeding 50 per cent, so that a member pays away 1d. to the officers and collectors for their remuneration for every 1d. he invests for his own benefit. The collection of small sums periodically is necessarily a costly affair, and until the working classes can be persuaded to dispense with the services of the collector they must be prepared to pay him for the work he does. On the present system, the pay is so high that a collecting-book is a valuable commodity and is often passed from hand to hand for a considerable sum.

The privileges granted to friendly societies by the existing Acts may be briefly summed up as follows:—

1. The right to hold land.
2. The summary remedy in case of misapplication of funds.
3. Priority of claim on estates of deceased or bankrupt officers.
4. Transfer of stock by direction of the chief registrar.
5. Exemption from stamp duty on all documents of the society.
6. Permission to admit persons under twenty-one years of age as members.
7. Reduction of the fee for certificates of birth and death.
8. Power to invest with the National Debt Commissioners.
9. Admission of trustees to copyhold property at a single fine.
10. Discharge of mortgages by endorsed receipt without reconveyance.
11. Power to call officers to account and recover property from them.
12. Power to settle disputes in the manner the rules provide.
13. Power to insure the funeral expenses of members' wives and children.
14. Power to members to nominate for sums at death up to £100.
15. Power to pay sums under £100 without administration.
16. The services of a public auditor at a fixed scale of fees.
17. The recording of its documents in the office of the registrar.

In order to restrict these privileges to societies whose members are mainly of the working class, it is enacted that no society shall insure more than £200 on a death or other event, or more than £50 by way of annuity. In fact, these limits are rarely reached. Several wealthy and prosperous mutual assurance societies were originally established as friendly societies, but by an act passed in 1854, they were discharged from the provision of the Friendly Societies Acts, except so far as relates to the registration of trustees, which still takes place with regard to some of them, and is the only relic of their original constitution.

E. W. B.

FRITH-GILDS, see GILDS.

FRUGALITY, see THRIFT.

FUGÆ WARRANT (Scotland). A warrant to apprehend a debtor, foreigner or native, who meditates or is reasonably believed to meditate flight from Scotland. It is granted by a magistrate, usually the sheriff; the creditor applies for the warrant, giving upon oath or affirmation his claim of debt, which may be even a contingent debt, and his grounds for believing that the debtor means to fly from the country; the magistrate makes inquiry into the facts; he may then grant a warrant to arrest the debtor for examination; and this may be followed by a warrant to commit the debtor to prison until he finds security to appear in court. The creditor is liable in damages if his statements are unfounded. The sheriff's warrant may be executed in any Scottish county, if backed, but has no force outside Scotland. A. D.

FUGGERS. A well-known German merchant family, and an interesting example of hereditary enterprise and success. They came originally from Suabia; at least as early as the 14th century they settled at Augsburg. The first known by name, Hans Fugger, was a poor weaver. His descendants became traders as well as artisans, Ulrich carrying on trade early in the 16th century in the Baltic and the Mediterranean, and Jacob importing goods direct from India instead of by way of Venice. A little later they added banking to their other undertakings, though hitherto none but Jews and Lombards had traded in money; Alexander (died 1560) even set up counting-houses in India and Venezuela. Their willingness to lend immense sums of money to the emperors Frederick III. and the impecunious Maximilian, to Charles V. and to Philip II. of Spain, fixed the family fortunes. Lands and mines, first given as security, were retained in full ownership when the loans were not repaid. To estates titles were added; by marriage and purchase new lands were continually acquired; at the same time the family trade was kept up. "Rich as a Fugger" became a proverb. With liberality proportioned to their wealth they were foremost in public spirit; they were founders of religious and charitable institutions, they were patrons of art and learning; one collected antiquities, another brought together a fine library of books and MSS. Some branches of the family are still in existence.

G. P.

FULLARTON, John (*c.* 1780-1849), writer on currency. After having been an assistant surgeon in Bengal from 1802 to 1813, Fullarton became partner in a bank at Calcutta; and, having there acquired a fortune, retired to England. He contributed some articles to the *Quarterly Review* at the time of the reform. But he is principally remembered for his book on *The Regulation of Currencies* (1844), a work "of exceeding ability" in Prof. Walker's words.

An uncompromising assailant of the Currency Principle (*q.v.*), Fullarton maintains the impossibility of over-issuing a convertible currency (ch. v.). "The self-regulating principle of a convertible currency operates in every such case with the precision of clock-work" (*Ibid.*). Mill places Fullarton with Tooke as one of "the most prominent representatives" of the "counter-theory," which is the extreme opposite of the currency principle; quotes an important passage from him, and adds: "I believe that the theory grounded by Mr. Fullarton upon this fact [the action of the country bankers] contains a large portion of truth, and is far nearer to being the expression of the whole truth than any form whatever of the currency theory" (*Political Economy*, bk. iii. ch. xxiv. §§ 1, 2) Prof. Walker strikes the balance of judgment less favourably to Fullarton's views (*Money*, p. 426 *et seq.*). For a very unfavourable estimate of Fullarton's book see Col. Torrens, *Principles and Practical Operation of Sir Robt. Peel's Bill of 1844 explained and defended against the objections of Tooke, Fullarton, and Wilson* (1848).

Besides the main thesis of Fullarton's work, there are in it important minor contributions to monetary science. Thus at p. 23 (ed. 1845) he attributed to an inconvertible currency much the same defects as Mill afterwards did (*Pol. Econ.*, bk. iii. ch. xiii.); with this additional remark as to the supposed possibility of regulating the paper currency by the price of bullion: "it is quite a mistake to suppose that the market prices of the precious metals would observe the same range of fluctuation, when those metals should be reduced to a common footing with other commodities, which they observe when constituting the circulating medium of a country"; in proof of which he adduces the fluctuations in the price of gold during "the hundred days." Many other interesting historical allusions occur.

On the regulation of Currencies, being an examination of the principles on which it is proposed to restrict within certain fixed limits the future issues on credit of the Bank of England and of the other banking establishments throughout the country, 1st ed. 1844, 2nd ed. 1845.

FUNCTIONS. When two quantities are so selected that any variation in one is attended with some variation in the other, the latter is said to be a function of the former; and is called the dependent variable—dependent on the other variable which is called independent. In symbols: $y=f(x)$, where y is the dependent, and x the independent variable. For the symbol f some other letter, usually of cognate sound, as ϕ or ψ, is often used. The following are particular examples; $y=a+bx$; $y=a+bx+cx^2$; $y=a+\log(b+cx)$; where a, b, c are *constants*. One of the most important properties of a function is the rate at which it increases or decreases as the independent variable is increased. This rate is measured by another

function which is called the derived function, or differential co-efficient: in symbols $f'(x)$ or $\frac{dy}{dx}$. Thus, if y, the original function is $\log(a+bx)$; it is found that the derived function is $\frac{b}{a+bx}$, supposing that "natural" (or Napierian) logarithms are used; otherwise the expression in the text must be multiplied by a certain constant. Whence it appears that the rate at which y increases with an increase of x is less for larger values of x. A derived function has its own derivee, called, with reference to the primary function, the second derived function or second differential co-efficient. Thus, in symbols $f''(x)$, or $\frac{d_2y}{dx^2}$ the second differential of $\log(a+bx)$ is $\frac{-b^2}{(a+bx)^2}$; denoting that the rate of increase measured by the first differential diminishes at a rate which is slower for larger values of x. This notation and conception is extended to the case of two (or more) independent variables. The symbols $z=f(x, y)$ denote that any variation in either of the independent variables x or y is attended with some variation in the dependent variable z. The rate of variation due to change in each variable may be separately measured. The measure is called the differential co-efficient with respect to either x or y as the case may be; in symbols $\frac{df(xy)}{dx}$ and $\frac{df(xy)}{dy}$; or more shortly $\frac{df}{dx}$ and $\frac{df}{dy}$. An important inquiry with respect to any function is: what are the values of the independent variables for which the dependent variable is a maximum or minimum. The solution of this problem, in the case of a function of a single variable, is given by the equation $f'(x)\left[\text{or } \frac{dy}{dx}\right]=0$.[1] Thus the value of x, for which the function $\log(a+bx)-cx$ is a maximum, is found by equating to zero the first differential of that function namely, $\frac{b}{a+bx}-c$.[2] Whence the value of x is found to be $\frac{b-ac}{bc}$. In the case of two (and *mutatis mutandis* more) independent variables there are two simultaneous equations of the form $\frac{df}{dx}=0\frac{df}{dy}=0$, to determine the values of x and y for which z the independent variable is a maximum or minimum.

These mathematical principles have important applications to political economy. The propositions in virtue of which economics may claim to be an exact science, involve the ideas of a function and its variation. The Law of Diminishing Returns (*q.v.*) may be thus stated: $y=f(x)$, where x is the amount of outlay (on a given portion of land), y is the corresponding return, and f is such a function that f'' continually decreases as x increases: or, in other words f'' is always negative. The logarithm, as has been shown above, is such a function; and, accordingly, this simple function was used by Malthus to express the relation between increasing population and subsistence; for such is the import of his statement, that the one increases in arithmetical, the other in geometrical, progression. The vain disputes to which this dictum has given rise illustrate the advantage of using the general language of symbols. A similar notation may be employed to represent the analogous Law of Diminishing Utility (see Utility). The Law of Increasing Returns (*q.v.*) might be represented by a function, like $a+bx+cx^2$, whose first differential, $a+b+2cx$, continually increases with the increase of x. It has been well said that every theory in economics may be regarded as the solution of a problem in the calculus of maxima and minima: to obtain the greatest satisfaction with the least effort and sacrifice being the aim of the economic man. The language of that calculus is the mother tongue of abstract economics. The simplest economic problem, the case of one commodity x being exchanged against another y in a perfect market, is governed by the principle that each party seeks to maximise his advantage considered as a function of the amount which he obtains of one commodity, and parts with of the other. The equations which determine the position of maximum are given by Jevons (*Theory of Political Economy*, ch. iv.; cp. Marshall, *Principles of Economics*, 2nd ed. Mathematical Appendix, note xii. *sub finem*). Especially where the number of variables is considerable the use of functions is required; since in that case geometrical illustration is not available. The difficult theory which Prof. Marshall formulates as the Law of Substitution (*Principles of Economics*, passages referred to in Index, *sub voce*) is perhaps most easily deduced by regarding the profit of the entrepreneur as a function of the amounts of each agent of production which he employs. Say $z=f(x_1, x_2, x_3 \text{ etc.})$ The condition that z should be a maximum gives the equations $\frac{df}{dx_1}=0$; $\frac{df}{dx_2}=0$, etc. This is the equivalent of the proposition that "the tendency of every one to select the best means for obtaining his own ends . . . would have caused each several kind of labour or machinery, or other agent of production to be used for each several purpose until its further use was no longer remunerative; the employment of each several agent in each branch of production would have been extended until full advantage has been taken of its special fitness for the work" (*Prin-*

[1] To discriminate a maximum from a minimum, a second condition is required; and is afforded by the *sign* of the second differential co-efficient.

[2] See note 1.

ciples of Economics, 2nd ed. p. 559, cp. Mathematical Appendix, note xiv.). Still more generally we may regard the "net advantages" of the economic man as a function of two sets of variables, corresponding to his efforts and sacrifices, and his consumption. The position of equilibrium is then determined by two sets of equations of the form,

$$\frac{df}{dx_1}=0\,\frac{df}{dx_2}=0, \text{ etc}$$
$$\frac{df}{dy_1}=0\,\frac{df}{dy_2}=0, \text{ etc.}$$

In the light of such general theories the dispute whether normal or natural value is determined by utility or cost of production appears nugatory. You might as well ask whether, when two unknown quantities, x and y, are determined by two simultaneous equations, x or y contributes more to the solution.

[A knowledge of the theory of functions sufficient for the economist is afforded by the introduction to the second edition of Prof. Walras's *Eléments d'Economie Politique Pure.*—Pantaleoni, *Econ. Pura;* and by Mr. Wicksteed's *Alphabet of Economic Science.*] F. Y. E.

FUNDED DEBT. This expression was originally used as a description of debt, the service of which was secured by a special fund (*e.g.* the produce of a certain tax) but gradually the meaning acquired by the term was that of debt raised for permanent purposes and either repayable at a distant date or not repayable at any definite date. The funded debt of the United Kingdom belongs to the latter class but the government have the right to redeem after a fixed period; *e.g.* the local loans stock is redeemable from 1912, the new consols (Goschen's) from 1923. This does not, however, prevent a gradual reduction of the funded debt before the periods named; this is accomplished in the following way. A fixed yearly sum, 25 millions since 1889, is applied to the service of the debt, and any amount not required for payment of interest is used by the National Debt Commissioners for the purchase and subsequent extinction of parts of the funded debt. Another mode of reducing the debt is the conversion of consols into TERMINABLE ANNUITIES (*q.v.*). The funded debts of foreign countries are frequently repayable at fixed dates either gradually, by yearly purchases or drawings, the funds being supplied by a regular sinking fund, or by simultaneous repayment of the whole issue. The consolidation of the funded debt of a country into one stock is convenient for many reasons. [For unfunded debt, see FLOATING DEBT. For general history, see NATIONAL DEBT.] E. S.

FUND, SINKING. See SINKING FUND.

FUNDING SYSTEM. This expression, which properly denotes the system of creating FUNDED DEBT, came to refer specially to a particular abuse of the system. (See NATIONAL DEBT.) C. A. H.

FUNDS, THE PUBLIC. See DEBTS, PUBLIC.

FUNGIBLES—a term borrowed by the mediæval economists from the Roman lawyers, *res quæ mutuâ vice funguntur* (are interchangeable). By both it is opposed to CONSUMPTIBLES (*q.v.*), but whereas in law fungibles are those things which, when borrowed, have to be returned not *in specie*, but *in genere*, in economics the term is employed to denote things of which the use is prolonged, as, *e.g.*, a house. For these interest was permissible, whereas to exact interest for the former was to sell a thing and also to charge for its use, consequently it was unjust. Money was classed as a *consumptible*, and usury declared to be wrong (see CANON LAW).

FUOCO, FRANCESCO, who died at Naples, 1841, passed his life under the pressure of want, a long exile, and even the necessity of selling some of his works, for which other and ignorant persons got the credit. He possessed above any of his contemporaries a keen spirit, apt to study, suited to economic investigation; but never enjoyed the comfort of seeing his works valued in their true light. To SCIALOJA (1840) and MOHL (1844) is due the honour of reviving his fame by their eulogies; Professor Ricca-Salerno (*Storia delle Dottrine Finanziarie in Italia*, Roma, 1881), and T. Fornari (*Delle Teorie economiche nelle Prov. Napoletane dal 1735 al 1830*, Milano, 1888) wrote later and at greater length on his theories.

Fuoco treated all the most important theories of economic science. The *theory of method* in his opinion should be positive, using mathematical formulæ. The *theory of value* he analyses with a peculiar insight, supporting in general the doctrine which bases the value of things on their utility, and derives the measure of value from the comparison of quantity and quality. He was the first in Italy to acknowledge the importance of Ricardo's theory of rent,—which he fully supports, particularly fixing attention on the rent derived through *situation*. He wrote on population, industry, and other social matters, arguing as a final thesis that moral and economic principles are reducible to a common basis. He also discussed coinage and bank questions, especially in one of those works (*La magia del credito svelata*) which he sold under the burden of want, to Giuseppe de Welz of Como, who published it under his own name. Fuoco had written this work to support the financial policy of the minister Medici. In this work he proved, with great brilliancy, that credit multiplies capital—a thesis which was afterwards considered from

another side and with a more severe logic by Francesco Ferrara, the greatest economist of our modern days in Italy (see *Biblioteca dell' Economista*, ii. S. vol. vi., Torino, 1857, Introduzione).

FÜRSTENAU, KARL GOTTFRIED (1734-1803), a theologian and lecturer on economics, Hebrew, general literature, and logic in the University of Rinteln (East Prussia), his native town, where in 1786 he became *primarius* of the Faculty of Philosophy. In 1779 was published, at Cassel, his *Apologie des physiocratischen Systems*, highly esteemed by his contemporaries. Fürstenau, although a firm adherent of the doctrine of the physiocrats, did not conceal his opinion that it was impossible to apply its practical conclusions in old countries, organised on an antagonistic basis.

E. Ca.

FUSTEL DE COULANGES, NUMA DENIS (1830-1889). The aim of the most important works of M. Fustel de Coulanges is to establish a bridge over the obscure gap which separates the institutions of Roman Gaul from those of mediæval France; in particular, he has very carefully worked out a theory of the origin of feudalism and the manor, which is in many respects worthy of study even by those who differ from the results at which he arrives.

Though not the first published of the author's works, the *Recherches sur quelques problèmes d'histoire* is in many ways the first in order. It consists of four essays entitled *Le colonat Romain*, *Du régime des terres en Germanie*, *De la marche Germanique*, and *L'organisation judiciaire dans le royaume des Francs*. The first three essays are directly connected with the third volume of the *Histoire des institutions politiques de l'ancienne France*, which has for sub-title *L'alleu et le domaine rural*, and may be treated of with that work. Together they contain the author's theory of the manor, and demand a fuller treatment than his other work, inasmuch as they deal with questions which touch economics more nearly.

The starting-point of the history of the manor is to be found, according to M. Fustel de Coulanges, in the institutions of the Roman empire. The system then existing was one of complete private ownership of land with certain peculiar characteristics. The country was divided into estates or "domains," each normally under one proprietor, who had full powers of alienation and bequest. Each estate was, as a rule, compact, and possessed a name by which it was known and which adhered to it. One proprietor might own many such estates not contiguous. But the estate in itself remained an organised unit never divided and rarely uniting with another to form a new unit. The cultivation of such an estate in the later empire was carried on partly by slave labour employed upon land retained in the owner's own possession. But side by side with this another system had grown up. Certain slaves were allowed as a privilege to become tenants-at-will of parts of the estate, paying for their land partly at any rate in services performed on the remaining land. The tenure, legally speaking, was of course wholly at the will of the owner, but the action of the officers of the Roman treasury began to give it a species of stability. From the end of the 3rd century the names of slaves holding under this tenure were noted in the surveys made for the purpose of taxation, and this action did something to make this kind of tenure more permanent. The freed slaves of the owner probably occupied a similar position on the estate. But in addition to these servile cultivators, there was another class, the "coloni," *i.e.* free cultivators attached to the estate and incapable of quitting it, paying for their land in services and rent, both being fixed for each estate by local custom. The management of this system was in the hands of officers who looked after the collection of rents, and directed the employment of the labour of the tenants on the part of the estate reserved to the owner. For the estate was divided into two parts, the part let out to the free or semi-servile cultivators, and the part retained in the owners' hands. In the same way on each estate there was the "villa" for the proprietor, and the barracks ("ergastula") where the real slaves were housed, and elsewhere the separate dwellings of the other cultivators. This seems to have been the state of things in France, as in other parts of the Roman empire at the time of the German invasions. In the first two volumes of the series the character of the invasion is discussed, and there and in several essays the author deals with the character of landed property in Germany before the invasion. His conclusion on the latter point is that there is no ground for supposing that any common ownership of land existed in Germany outside the limits of the family. This conclusion is perhaps not unassailable, but the author's attack on Maurer's well-known theory of the mark community in the essay entitled "Le problème des origines de la propriété foncière" (*Revue des Questions Historiques*, April 1889) certainly makes out a formidable indictment against that scholar's theory.

The character of the estate has been described as it existed just before the German invasion. But during the period of conquest and after the conquest is complete the estate can be discovered existing in the same form. The method of cultivation is the same. The estate retains its old name and often its old owner. The new German settlers added, in fact, nothing to the land system they found, and took nothing from it. The manor sprang not from a Teutonic mark community, but from a Roman "domain" under the influence of Roman law and custom. The "Saltus Buritanus" noticed in the essay on the Roman colonies is to all intents and purposes a manor existing in the time of the Emperor Trajan in a province of Africa out of the reach of Teutonic influence. Nor can this estate have been a solitary instance. In one point the theory is open to criticism. It accounts for the existence of the manor court, as will be seen on reference to the chapter on "L'immunité" in the fifth volume of the *Histoire des Institutions;* but it does not account for the peculiar system of cultivation known as the THREE-FIELD SYSTEM (*q.v.*), which is so closely associated with the MANOR in many countries. No allusion to this point occurs indeed in the volumes whose argument has been summarised above.

The fourth and fifth volumes of the series deal with problems of politics and government; in the volume entitled *La Monarchie Franque* the author lays down that during the rule of the Merovingian dynasty the dominant power in the state was the king. He succeeded in fact to the position of the Roman emperor. There was no popular assembly to oppose him, and only the elements of a nobility. The Roman bureaucracy, which remained after the fall of the empire, became his instruments of government. The administration of justice was carried on by the king's officers, and there are only traces to be noticed of the growth of local jurisdictions. Even the financial system remained almost unaltered. The invading Germans had expelled the Roman governors but not their method of government; and there is no authority for tracing to their influence either the popular assemblies of later times or the military system known as feudalism. The history of the origin and growth of feudalism is the subject of the last volume of the series. The sources of this, according to the author, are three in number. In the first place he considers the history of the subordination of land; that is to say, the custom of holding land belonging not to the holder but to a superior. This he traces to the Roman custom of holding land "precariously," *i.e.* not in full property but at the will of the real owner, who permitted what was in the eye of the law an usurpation; this tenure gradually grew to be for the life of the tenant, and was on his death renewed for his heir on his making a formal request for its continuance. Hence sprang the early form of the "fief." The second source is the relation of patron and client, a relation common to Rome, Gaul, and Germany, which familiarised men's minds with the notion of "fealty." It only needed local independence to complete the scheme of a non-military feudalism. This was supplied by the "immunities" which the Merovingian kings not unfrequently granted. A lord who received such a grant became possessed of full power over his lands. The king's officers could not enter; justice was administered solely by the lord; and the local independence of the district and its complete subjection to its owner followed. The military character of the services rendered was only one phase of the militarism of the period. But military service, historically speaking, is of later growth than feudalism.

The concluding volume of the series deals with the complete establishment of feudalism, and traces the gradual fall of the Merovingian kings before the new organisation of society which they had allowed to grow up. The crown lost its power of legislation, its power of taxation, and its control over the army; and with these the administrative system inherited from the Roman empire also disappeared. With Pepin a new form of monarchy based upon feudalism begins.

Something must be said of the method of study which led the author to his conclusions. The only evidence he accepted is documentary evidence, and to the study of this evidence he brought an unrivalled knowledge of the documents and of their language. Few scholars have ever approached him in knowledge of the variations in meaning through which a word in mediæval Latin may pass. In particular his study of the word "marca" in the essay referred to above is well worth notice. That all his conclusions will stand the test of criticism is hardly to be expected, but the publication of his books has certainly been an epoch in the history of mediæval scholarship.

His life was passed in teaching, first as professor at Strasbourg, and afterwards in similar posts at Paris.

La cité Antique, 1864.—*Histoire des Institutions de l'ancienne France*, vol. i.—*La Gaule Romaine*, 1891; vol. ii., *L'invasion Germanique*, 1891. [First published in one volume in 1875; reprinted, 1877; now republished with large additions.]—Vol. iii. *La Monarchie Franque*, 1888.—Vol. iv. *L'alleu et le domaine rural pendant l'époque Mérovingienne*, 1889.—Vol. v. *Les origines du système féodal*, 1890.—Vol. vi. *Les transformations de la royauté pendant l'époque Carolingienne*, 1892. Camille Jullian].—*Recherches sur quelques problèmes d'histoire*, 1885.—*Nouvelles recherches sur quelques problèmes d'histoire*, 1893.

—*Questions Historiques*, 1893. [These two volumes contain reprints of the more important articles contributed by the author to the *Revue des deux Mondes;* the *Revue des questions historiques; the Revue historique de droit Français et Etranger*, and other periodicals. Among them are essays on the law of property in ancient Greece, on Polybius, on the island of Chios, and other classical subjects, and an essay on the origin of property in land (translated into English by Margaret Ashley, 1891,—Sonnenschein).]

C. G. C.

FUTURE GOODS AND SERVICES. Terms that have acquired a technical meaning and importance in recent economic theory; primarily in that of the AUSTRIAN SCHOOL, and particularly in the writings of v. Böhm-Bawerk, where they connote differentiations of economic phenomena in time; secondarily, in the writings of American economists, where they have begun to connote also the dynamic phases of economic phenomena, for which "time" is a mere abstraction. Future goods and future services must be carefully distinguished from certain other economic factors with which they are often confounded, and they must then be observed in their relations to the phenomena of subjective value, of objective value in exchange and distribution, of consumption and production.

In this article the term "goods" always means those concrete physical objects that render what Böhm-Bawerk has called "material services" through redistributions of matter and energy. "Services" are useful actions, efforts, or changes that are immaterial, personal, or social in character. The same laws govern the values of future goods and future services, and it is therefore quite unnecessary to treat them separately, except when it is desired to emphasise the fact that services are often more transient in useful action than goods. But this is by no means always true. Certain immaterial utilities, *e.g.* legal rights, may endure through periods of time compared to which the economic life of a vast majority of material goods is insignificant. (See also GOODS, CLASSIFICATION OF; GOODS, ECONOMIC.)

Future goods and services are not identical with Menger's category: "goods of the second order," *i.e.* instruments of production. Not only do future goods include prospective consumers' goods, but producers' goods now existing are not future goods, though frequently so called. Strictly speaking, they are present equivalents of future goods. In accurate analysis we must remember the possibilities of cross-classification. Future goods may be primary—*i.e.* consumers' goods, or secondary —*i.e.* producers' goods. Consumers' goods or producers' goods may be present or future.

Future goods comprise all economic goods not now existent or complete, but which, it is practically certain, will be existent and ready for use at any designated future time. They include all goods in process of production which will doubtless be finished and put in market. As communities provide more adequately for their future, future goods become an increasingly important economic category. They become "as much objects of economical dealing as present goods." They are produced, valued, bought, and sold.

In the market, future goods are of less value than present goods of like kind and number. According to the theory that derives market or objective value from subjective valuations, we have to seek the reason for this phenomenon in the lower marginal utility of future goods. Marginal utility, in turn, is not an ultimate fact, and Böhm-Bawerk names three co-operating causes of the relatively low marginal utility of future goods. These are (1) the better provision for future want; *i.e.* the reasonable assurance that future want will be more adequately met by supply than present want; (2) men's usual under-estimation of the future; (3) the technical superiority of present goods. The second cause is resolved into three factors; namely (*a*) imperfect imagination of future conditions, (*b*) weakness of will, attributable in part no doubt to imperfect imagination, (*c*) the uncertainty of life. The technical superiority of present goods is the group of circumstances: (*a*) that a surplus of consumers' goods enables men to spend time in making such producers' goods as tools and machinery; (*b*) that these in turn co-ordinate natural energies in useful ways, enormously multiplying productive power; and (*c*) that as these processes take time, the sooner they are begun the greater the gain. It is obvious that human progress tends to correct the under-estimation of the future, and therefore to emphasise the relative importance of (1) and (3) as permanent causes of the under-valuation of future goods. In the view of the present writer, Böhm-Bawerk has not sufficiently developed the underlying connection of the better provision for future want with the technical superiority of present goods, and has therefore failed to discover the ultimate and permanent economic cause of the under-valuation of future goods, and consequently the true cause of interest, in the relatively low cost of production of future, the relatively high cost of production of present, goods. This phase of the question will be referred to again.

The unequal values of present and future goods affect two great classes of transactions. One is the exchange of future consumers' goods, FUNGIBLES, for present CONSUMERS' GOODS, and the agio takes the form of loan interest. The other is the exchange of consumers' goods for producers' goods of various ranks—mills, machinery, tools, materials in all stages of production, and of labour, both skilled and unskilled. In transactions of this latter kind producers' goods are equivalents of future

consumers' goods and must be valued in terms of such. The dealers are capitalist-undertakers, and the differential value of the present goods which they are constantly exchanging for future goods, though essentially the same thing as interest, is merged with such other elements as gains of speculation, rent of ability, wages of superintendence, etc., in the gross profits of production.

The economic phenomenon here described has found expression in the ambiguous formula that "the value of means of production lags behind the value of finished products." The intended meaning is that the value of means of production equals the value of the future finished products which they will bring forth, and is therefore less than the value of present finished products of like kind and number. In the modern world the phenomena have become exceedingly complicated through a double use of innumerable kinds of goods, which, at any moment, may be devoted to consumption or to the furtherance of production. Since cattle exactly alike will not sell in the same market for different prices simply because some of them are to be kept for breeding and others butchered for beef, the formula quoted above seems to be contradicted. The Austrian reconciliation is through recourse to the doctrine that the value of the whole stock of any commodity which admits of different uses is determined by the marginal use. If there are nine possible uses, present and future, for 500 pieces of goods, in groups of 100 pieces each, only five uses can be actually chosen, and these will be the five of highest utility. The lowest utility of these five will determine the value of the entire 500 pieces. Let this be *a* utility of present consumption. Then, since the utilities realisable in the future are greater, the pieces devoted to future use may undergo a present discounting of their future value, and yet sell at the same price per piece as the pieces devoted to present use. This explanation is consistent with the intended meaning of the formula that "the value of means of production lags behind the value of finished products" on one condition only, namely, that the future value of finished products to be obtained by means of 100 units of present goods used productively shall be greater than the present value of 100 units of exactly similar goods now used in consumption. The mere "ripening" of the value of so many units of goods productively employed until their future value exactly equals the present value of goods of like kind and number, consumed in present time, does not at all satisfy the conditions of this problem. The alternative is exactly that kind of productivity of capital which Böhm-Bawerk has stoutly denied. Economists generally have not followed him in rejecting the productivity theory of interest, and it would seem that his own "positive" theory, so far from being inconsistent with it, is in fact built upon it in a disguised form. Capital invested in productive means must be not only "technically" productive of "more goods," but economically productive of "more value" to realise the following combination, which the modern industrial world does actually present, namely, (*a*) goods available indifferently for consumption or production; (*b*) selling for either purpose for the same price in the same market; but (*c*), if used productively, equal in value now only to the present value of the consumers' goods that they will make available at the end of a production period; yet (*d*) of less value now as producers' goods than are present consumers' goods, equal in quality and quantity to the future consumers' goods to be brought forth by these given producers' goods at the end of the given production period.

These phenomena of the unequal values of present and future goods affect all the phenomena of distribution. All shares in distribution must be reckoned in terms of present values. This is a principle of fundamental importance, unrecognised in earlier discussions, which compels us now to correct many of the classical formulas. All co-operating parties or factors in production who take their shares in future goods will get, in the normal course of things, at the end of their waiting, a greater quantity of goods of any given kind than can be obtained by those whose needs or desires must be met immediately. Those who can take their pay wholly or in part in producers' goods will in the long run have more to show for their labour than those who must get consumers' goods at once. This, as Böhm-Bawerk says, is the true secret of the dependence of the labourer on the capitalist. It is also the element of truth in the WAGES-FUND doctrine. To the extent that a labouring population is employed on distant results, but is unable to take its pay in the ownership of future goods, must its wages be limited by disposable present goods, the free or remuneratory capital of the English economists. The value of these is the means of measurement of what Professor Clark has called pure capital, since the fund of available value invested in producers' goods must always be measured in terms of present goods. Wages can never exceed the concrete free capital of the older nomenclature except as labourers become capitalists and take part of their reward in the pure capital invested in productive instruments, or in materials in process of advancement towards future consumers' goods. If then, denying the wages-fund doctrine, we affirm that wages are drawn from product and measured by product, we must add that to the extent that our modern production is capitalistic in its methods, wages are drawn from capitalised product and are measured only by product in terms of capital.

So far our account of future goods has adhered rather closely, though not strictly, to the Austrian exposition. The relation of future goods to the theory of consumption and to cost of production has been worked out chiefly by American writers. Professor Patten, who was among the first to point out the importance of present and future in wage theories, has given attention chiefly to the phenomena of consumption. In a discussion of Marshall's doctrine of consumers' rent he denies the possibility of consumers' surplus from producers' goods. For example, we cannot get consumers' surplus from ploughs and from wheat produced by means of ploughs. The value of the ploughs is "imputed" to them by the future consumers' goods, wheat, etc., and their value, in turn, must be converted into the value of present wheat, which alone, therefore, yields a true consumers' surplus.

Of greater importance, however, is Professor Patten's theory of the dynamic action of changes in consumption itself. These affect all values, subjective and objective, and react on production and distribution. Consumption is governed in its evolution by (*a*) the psychological law that a harmonious combination of many moderate but varied pleasures will make up a larger total of subjective utility than will a few intense pleasures, and (*b*) the objective fact that, because of diminishing returns on the one hand and the variety of nature's resources on the other, it costs less to enlarge a harmonious group of many moderate pleasures than to intensify a few. The consumption of a progressive community is a progressive adjustment to these conditions. Irrespective of increasing population, it becomes more varied, and the uses of particular kinds of goods are multiplied as they enter into new combinations. Therefore, we have no right to conclude that if future goods of any given kind are more abundant than present goods of like kind, they must be less valuable per unit. Demand for just these goods may increase as fast as supply, or faster, and the ground disappears on which rested the criticism of productivity theories of interest.

Professor J. B. Clark develops this thought even farther. He denies that in one important class of cases—the very class most often appealed to in the Austrian argument—there is any comparison whatever between present goods and future goods of like *kind*. When men save, they are either postponing the consumption of wealth or they are for ever renouncing consumption and converting wealth for all time into producers' goods. The latter only is permanent capitalisation. Postponement of enjoyment, as in provision for future travel, or for an education of culture merely, or for old age, is temporary capitalisation to be followed by decapitalisation. In permanent capitalisation we certainly do not compare present goods with future goods of like kind only, if any changes in consumption or in methods of production are contemplated, and, in fact, changes of both kinds always are contemplated, and capitalisation would not occur if they were not. Much less do we compare present and future goods of like kind when we merely postpone enjoyment. When the time for consumption comes, we shall have changed subjectively, and the conditions of life will have changed objectively. Our consumption will not be the same that it would be to-day, and, in fact, we do not expect or wish it to be. We deliberately exchange a group of pleasures that we could enjoy now for a different group that we can enjoy only in the future. Therefore the unequal values of present and future goods of like kind and number cannot be explained by subjective comparisons in the mind of the same individual.

If these conclusions are accepted, it follows that the value of future goods is always determined by comparisons of present goods of one kind with future goods of another kind, and that the difference in value per unit between present and future goods of the same kind is a resultant of many such comparisons by different persons. It is, in short, a phenomenon of objective or market value only. The under-estimation of the future disappears from our list of causes of interest, and we have left the purely objective fact that present goods are strictly limited in quantity, while, owing to the technical superiority, or productive potentiality, of present goods, and the progressive development of invention, future goods are relatively abundant. The value of future goods is determined, like any other value in any actual market, solely by the demand for and the supply of concrete goods.

If this is true, the relative quantities of present and future goods ought to be explained in terms of their cost of production. Like all commodities continuously produced, they should be found to have a normal as well as a market value. Cairnes showed that wages are not a cost, but that they correspond to and repay a cost, and but for the cost would fall to zero. In like manner, interest is not a cost, but it corresponds to and repays a cost, and but for the cost would wholly disappear. The attempt to show these relations has been made by the present writer. Future goods being always in relatively abundant supply, for reasons already given, he affirms that their conversion into present goods can always be hastened if desired, thus increasing the relative supply of present goods and diminishing their relative value. But hastened production is more costly than production at a usual or normal rate. It involves overtime or intensified labour, which is labour of diminishing return. This is the

whole significance of the "fatal lapse of time between the beginning and the end of the lengthy capitalist process" that Böhm-Bawerk speaks of. The process can be shortened, but shortening is costly. This extra cost, therefore, normally prevents the lowering of value of present as compared with the value of future goods which otherwise would be possible through an abnormal acceleration of production. The abnormal cost of hastened production is the normal measure of the difference in value between present and future goods and the normal measure of interest.

[For details of the views here presented consult *Capital and Interest*, and *The Positive Theory of Capital*, by Dr. E. v. Böhm-Bawerk, translated by Wm. Smart. A sketch is given in *Quart. Jour. of Econ.*, April 1889, by J. Bonar.—Francis A. Walker, "Dr. Böhm-Bawerk's Theory of Interest," in *Quarterly Journal of Economics*, vol. vi. No. 4, July 1892.—Simon N. Giddings, three articles in the *Quarterly Journal of Economics*, namely, "The Cost of Production of Capital," vol. iii. No. 4, July 1889; "The Theory of Capital, vol. iv. No. 2, January 1890, and "The Growth of Capital and Cause of Interest," vol. v. No. 2, January 1891. The important remark of Professor Clark, that the same individual does not exchange present for future goods of like kind, is from his paper in the *Yale Review*, November 1893.—Consult also the English economists, the elder John Rae, N. W. Senior, J. S. Mill, Jevons, Sidgwick, and Marshall; the Italian economist Loria and the German Dietzel for criticisms; and of the Austrians, Menger, Sax, and Wieser.] F. H. G.

FUTURES. Dealings in "futures" take place in almost every large market. On the London Stock Exchange, transactions are for a settling day, fixed, or to be fixed (see SETTLING DAY), and a large proportion of the bargains are made in the expectation, on one side at least, of their outset by a future transaction (see also OPTIONS, PUT AND CALL). In many kinds of commodities bargains also are made for delivery at future dates, whether delivery may ultimately be taken, or the right thereto be sold. In the United States, dealings in "futures" are the chief feature in the wheat trade. In London, "futures" in silver, tea, coffee, sugar, and wheat are largely dealt in through the London Produce Clearing House, which guarantees to buyers and sellers the due performance of the contracts, bargains being made for delivery at any time up to six months, against a deposit of 5 per cent of the value (see MARGIN). The power to purchase "futures" is sometimes an important part of a manufacturer's arrangements, enabling him safely to take extensive contracts by ensuring a continued supply of raw material at a definite price. On the other hand, a large proportion of such dealings is purely gambling, and upon this ground their suppression by law has been advocated. Besides these objections upon moral grounds, it has been urged that the sale of "futures" has a direct effect upon prices, equal to that of a large increase of supply, and has, in the case of wheat at least, caused a prolonged depression of price beyond the minimum cost of production. (On this last point see *Commercial Gambling the Principal Cause of Depression in Agriculture and Trade*, by C. W. Smith, 1893.) R. W. B.

FUTURES IN COTTON will supply an example of dealing in "futures." The term is applied to contracts made for future delivery of cotton, transactions of this nature forming by far the larger proportion of business done in the Liverpool market; a fact which is self-evident when we reflect that almost every bale of American cotton imported into Liverpool is hedged by a sale of distant futures, whilst spinners also find this a convenient method of covering forward orders taken for yarns; and speculators, it is needless to add, resort almost entirely to this mode of doing business, involving, as it does, no outlay of capital beyond a margin to be agreed upon at time of contract, or a payment of weekly differences as customary by the rules of the cotton association.

The "future" market is also largely used for "straddling" purposes between Liverpool and New York, when the difference in price between the two markets is such as to permit of a commission being earned by a simultaneous purchase and sale.

Differences, unless otherwise stipulated at time of contract, are settled weekly, through the medium of the cotton CLEARING (*q.v.*), the price of settlement being struck each Monday at 11 A.M. and payment exacted on the Thursday following, and some idea of the magnitude of the business may be formed from the fact that in a single week it is estimated £1,500,000 at least has passed through the clearing-house for differences during that period only. R. C. B.

FYRD was the Anglo-Saxon militia. There was very little taxation before the Norman Conquest, because most of the expenses were defrayed by local obligation. Every freeman was subject to the *trinoda necessitas*, *i.e.* service at his own expense when summoned by the king (*fyrdung*), the repair of fortifications (*burhbot*), and the repair of bridges (*bricbot*). R. I.

GABELLE. This term, originally applied to any tax upon commodities, was gradually limited to the tax upon salt, perhaps the most odious and inequitable impost in France. Not only did the state reserve to itself the monopoly of the trade in salt, but it actually compelled the purchase of a minimum amount for every individual over eight years of age. This was called the *sel du devoir*. Originally the tax was uniform throughout France, but as time went on the most extraordinary inequalities grew up. The country was divided into five groups of provinces according to the price at which salt was sold by the GRENIERS À SEL (*q.v.*). These were (1) the *pays de grandes gabelles*, where the price was 62 francs the quintal; (2) the *pays de petites gabelles*, where the price was 33 francs 12 sous; (3) the *pays de salines*, where it sold for 21 francs 12 sous, and the tax was levied on the extraction of salt from the salt marshes; (4) the *pays redimés*, which had purchased exemption in 1549; (5) the *pays exempts*, which were exempted from the tax by the terms of their union with the monarchy. Many individuals received the privilege of being on the list of *franc-salé*, which included all hospitals, religious communities, and magistrates. The inevitable result of these inequalities was to give rise to a regular smuggling trade, and this in turn to a harsh and expensive system of police, often assisted by the troops. Necker says, "Thousands of men, attracted by the prospect of easy gain, devote themselves to a commerce contrary to the laws. Agriculture is abandoned for a career which promises greater and more speedy returns, and children are trained under the eyes of their parents to forget their duties to the state." The fact was that ever since 1548 the *gabelle*, like the other indirect taxes, had been farmed out to speculative companies. The net revenue from the *gabelle* is reckoned by Necker at 54,000,000 francs. The tax was condemned by all advocates of reform, from Vauban to Turgot, but it was not abolished until 1790. The Gabelle had the effect of seriously diminishing the consumption of salt, which was only half as much per head in the *pays de grandes gabelles* as in the exempted provinces.

GABLATORES, servile tenants, who paid rent either in money or kind in lieu of actual service. Such rent, *gafol* or *gablum*, occurs frequently in Domesday; seven gablatores are mentioned on the manor of Cheddar, part of the *terra regis* in Somerset, as paying seventeen shillings yearly to the king. By the 14th century such commutation was becoming general, and led to the formation of a class of tenants at money rents (see GEBUR).

[Cunningham, *Growth of English Industry and Commerce, Early and Middle Ages*, 1890, p. 160.—Round, *Danegeld and the Finance of Domesday*, in *Domesday Studies*, 1888, vol. i.] E. G. P.

GAËTA, DUKE OF, MARTIN MICHEL CHARLES GAUDIN (1756-1841), born at Saint Denis (Seine), died at Paris. He was placed at the age of seventeen in the office of the ministry of finance. In 1791 he was appointed one of the six commissioners of the national treasury. He resigned office on the breaking out of the Reign of Terror, and refused the portfolio of finance under the Directory, contenting himself with being the general commissioner of the post office, but accepted it after the 18th Brumaire from the hands of the First Consul. He continued to hold this office up to the fall of the empire, and during the Hundred Days. He assisted in the reorganisation of the administration of the system of finance. In this reorganisation the system of the *ancien régime* was taken for a model, of which he was, unfortunately, only too faithful a follower. For he thus recalled to life that spirit of bureaucracy which, while painstaking and order-loving, as we freely admit, was over-exact to a fault, treating the people as if they were children, incapable of understanding and managing their own interests, and especially of foreseeing what would serve those interests best. Absolutely honest and unassuming, acting always with the most perfect good faith, he earned and deserved the respect of the government of the Restoration, which appointed him (he was deputy for the department of the Aisne from 1815 to 1819) governor of the Bank of France in 1820, a post which he held till 1834. He declined a seat in the chamber of peers. A. C. f.

"He was," writes Napoleon from St. Helena, "an honest and orderly administrator, who knew how to be on good terms with his inferiors and to progress with a demure but steady step. Everything he did and projected from the beginning, he maintained and perfected during fifteen years of a wise administration." In his *Mémoires relatifs à la Révolution, à l'Empire et à la Restauration* (Paris, 2 vols. 1826), Gaëta himself explained the principle which guided him throughout life in the following terms:—"The spirit of order is the first desideratum in financial administration: it applies to everything and embraces both men and things."

In his *Notice Historique sur les Finances de la France* (1818), published to defend his financial administration against attacks from the more ardent among the Legitimists, the Duke of Gaëta states that when he first entered the ministry, the treasury only possessed in cash the miserable sum of 177,000 francs (say

£7080). "The *Assemblée Constituante*, with the best possible intentions, had decreed the ruin of our finances on the day when sacrificing true principles and the warnings of experience to vain abstractions, it had decreed the suppression of all taxes on consumption." In a note (p. 3) he adds that "indirect taxation is one of the *necessary* elements of a system of finance, capable of adaptation to all circumstances and to all wants." He adds (pp. 225 *et seq.*) that on principle and from the first day he assumed office he pursued two main objects: "first, to improve and consolidate (the national) credit by looking carefully after the interests of the creditors of the state; and second, to bring the ordinary revenue to the necessary level by taxes on consumption." . . . He also successfully organised the system of collecting the taxes and the execution of the general land survey (*Cadastre*) by the law of the 15th of September 1807, which is due to him, following in this the principle of the law of September 1791 (see CADASTRAL SURVEY). Gaudin ranks as the author of the modern system of French financial administration, acting on the opinion he had expressed in his *Notice historique* (p. 6) that, at the time of the outbreak of the revolution, the national assembly "might easily have *ameliorated* the older system instead of *destroying* it." The italics are his own.

Apart from the above mentioned works, the Duke of Gaëta published; *Observations et éclaircissements sur le paragraphe concernant les finances dans l'Exposé de la situation du Royaume présenté à la Chambre des Pairs* (1814).—*Opinion préliminaire sur les Finances* (1815).—*Mémoire sur le Cadastre* (1817).—*Aperçu théorique sur les Emprunts, suivi de quelques observations . . . sur l'ouvrage de M. Ganilh* (1817).—*Observations sur la proposition faite de réduire le crédit pour les travaux du Cadastre* (1820).—*Considérations sur la Dette publique de France, sur l'emprunt et sur l'amortissement* (1828).—*Considération sur l'Exposé des Motifs de la Loi du 17 Mai 1837 portant création d'un fonds extraordinaire pour les Travaux Publics* (1837).—*Des Conséquences du rejet par la Chambre des Pairs du projet de loi concernant la Conversion de la rente 5 per cent* (1840).

[See also *Essai sur la Vie et l'Administration du duc de Gaëte, ministre des Finances de l'Empire*, by Aug. Portalis (Paris, 1842).] E. CA.

GAFOL, GABEL, or GABLE, "payments in kind or in money, in labour, service in the field defined or undefined" (Gneist, *English Constitution*, translation, 1886, 1, 4). It was the least servile of the incidents of serfdom, paid by the GEBUR or villein, less fully by the cottier (Seebohm, *Village Community*, 1884, 141, 142). Vinogradoff (*Villainage in England*, 1891, 184) considers *gafol* to be an original, not a commuted payment, "the old Saxon rent in money or in kind," but admits exceptions, as in Kent (cp. GAVELKIND), where it may be unconnected with any base or villein service (p. 187). The word occurs in combination, *e.g.* gafol-earth, *i.e.* ploughing over and above the week-work, gafol-æle, etc. Seebohm (pp. 318-327) attempts to trace it to the dues paid by the Roman *coloni*.

[Kemble, *Saxons in England*, vol. i. ch. xi.—Round, *Domesday Studies*, vol. i. p. 132, and *Eng. Hist. Review*, January 1887, p. 103.—Stevenson, *Eng. Hist. Review*, April 1887, p. 336.] E. G. P.

GAINAGE or WAINAGE. The oxen, horses, ploughs, and other instruments used in carrying on the work of a farm.

[Cowel's *Interpreter*, ed. 1727, arts. "Gainagium" and "Gainage."] A. E. S.

GAITO, GIOVANNI DOMENICO (at Naples in 17th century); wrote a comprehensive treatise on transactions of credit, in which, like other writers, especially the Roman Sigismondo Scaccia, without openly endeavouring to modify the ideas of theologians and jurists, he proved the lawfulness of interest on money. It is interesting to observe the effort made in it to overcome the prejudice, existing at that time, to consider money as being an unfruitful property, without, however, venturing to oppose this opinion openly.

Tractatus absolutissimus de credito, Venetiis, 1626. A. B.

GALANTI, GIUSEPPE M. (1743-1799), born at Campobasso in one of the Neapolitan states on the south-east coast, of which in 1781 he wrote a description. His father destined him for the bar, which he gave up early to study literature and rural matters closely, a choice fostered in him by GENOVESI, whom he greatly admired, and on whose death in 1772 he composed *Elogio storico del Sig. Abate Genovesi*.

Galanti was invited by the government in 1786 to write the *Descrizione geografica e politica della Sicilia*, Napoli (translated into French and German, abridged in English). In this work, much esteemed at the time, Galanti expresses his opinions on the means proper to improve the national wealth. Following many Neapolitan writers before him, he, though eclectic, supports mercantilism. In his *Testamento forense*, Venezia, 1806, based on the arguments of Delfico, he supported the abolition of the feudal system on which the crown estates were still carried on at that date, maintaining that the general prosperity would have been more increased by selling or farming them, and agriculture improved by the consequent adoption of better methods. Galanti was a supporter of the single tax on land, admitting indirect taxes only when really needed and not weighing unduly on goods of first necessity; he deplored the existence of privileged classes, exempted from the payment of taxes, for taxes ought to be paid proportionately to property. Writing on population, he developed such sound principles as to be justly considered by Prof. Fornari, *Delle teorie economiche nelle Prov. Napoletane*, vol. ii., the forerunner of Malthus. A. B.

GALDI, MATTEO (18th century) a Neapolitan jurist. In his lifetime the laws regu-

lating the property in land were much discussed. He was of opinion that these should be as liberal as possible, and that in order to attain the greatest public prosperity, the number of proprietors should be as large as possible in every nation. Every legal institution which tended to prevent the free distribution of a great part of the territory of a nation should be abrogated.

Analisi ragionata del Codice Ferdinandino . . . Napoli, 1790. A. B.

GALE, AND HANGING GALE. An expression used in Ireland for an instalment of rent. Gale day is the day on which rent is payable.

The word is connected with *Gabellum*, gavel (see GAFOL). The "hanging gale" is the half-year's rent in respect to which the tenants on many estates were allowed to remain in arrear. C. F. B.

GALEON. The Spanish name of the ships *flotas y galeones* engaged in the officially authorised trade between Spain and America. Charles V. in 1526 and again Philip II. in 1561 decreed that the whole of this trade was to be monopolised by these *galeones* sailing every year or eighteen months and under military convoy from Seville to Carthagena and Portobello or Porto Rico and Vera Cruz. Occasionally a few ships, *navios de registro*, obtained licenses to sail by themselves or from other Spanish ports, but with such delays and formalities that these licenses were almost useless. In America the goods imported from Spain were sold at fairs and at previously fixed prices, which left profits ranging from 100 to 500 per cent. On their journey home, the *galeones* were also bound to unload their cargoes of precious metals in Seville (from 1717, Cadiz). The whole system resulted in an enormous premium to smuggling, and lasted until the middle of the 18th century, when it had greatly declined in importance.

[Colmeiro, *Historica de la Economía Política en España*, ii. pp. 401-421.] E. Ca.

GALIANI, FERDINANDO (1728-1787), born at Chieti, south-east coast of Italy. He lived at Naples and became an ecclesiastic and eventually a monsignore. From his youth upwards he showed high intellectual power, and reached high office, being a member of the supreme board of trade at Naples. In 1759 he was appointed secretary to the Neapolitan embassy at Paris, and soon after an envoy. He went to London, where he lived a long time and published his *Dialogues sur le commerce des blés*, Londres (Paris), 1770, which made him known throughout Europe, and drew forth vigorous replies. In 1773 he was recalled to Naples, and employed in high public office, which he filled to the entire satisfaction of the king.

The writings of Galiani were highly useful, especially his work *Sui doveri dei principi neutrali verso i principi belligerenti*, published during the Seven Years' War, during which the kingdom of Naples stood neutral. He investigated, with much originality, the fundamental problems of economic science, opening the way to its future progress. In his able work, *Della Moneta* (anonymous 1750, 2nd ed. with his name, 1780), he analysed the phenomenon of value, forming a theory which may have a little in common in its details with the other systems known in his time, but differing essentially from them in its theory of the basis of value. Galiani placed this in the concrete utility of single quantities of wealth—a utility which, according to him, is determined by the different degrees of demand; he remarks on the influence of time and the reciprocal influence of demand on value, which, in its turn, influences the former. This theory of the limit of utility forms a complete and regular system in which the several elements are first ascertained and then reduced to one alone. This element is neither labour nor rarity, separately considered, nor even utility itself. According to Galiani, the law regarding normal value is a mixture of several elements, all tending to give the idea of utility in its widest sense, and differently distinguished in degree and demand. Galiani's system has nothing in common with that of Locke and Cantillon, then generally accepted. It anticipates the theories of Jevons and Menger. In the work, *Della Moneta*, he defends charging interest. The chapter on the course of exchange, though imbued with *mercantilist* opinions, and showing some inconsistencies in the remarks on international trade, has great merits. His eight dialogues, *Dialoghi sul commercio dei grani* were translated into French by Diderot, January 1770, and are the most brilliant writings published up to that time in support of practical economics. The author declares himself in them the follower of no school; according to him in the corn trade the only system to be followed is to follow none. As he wrote subsequently in his *Corrispondenza*, the dialogues were never completed, he having intended to add one more (IX.), which was never published. Pecchio, *Storia dell' Econ. pubbl. in Italia*, Lugano, 1819, pp. 95-96, has given copious extracts and a short analysis of the dialogues. In the *Dialoghi*, Galiani does not speak of agriculture as the sole basis of wealth, as the physiocrats do, because several states have territories quite insufficient for their requirements. He praises the edict of 1764, which established free trade in corn in France, but he does not do this through an absolute conviction of the correctness of the theory. Every nation, every age, requires, according to him, different laws; it is absurd to resolve the problems of economical legislation by reference to abstract and absolute principle, because consideration must be had of an indefinite quantity which cannot be determined,—that is man, who may be entirely modified by habits. Many objections were raised to these opinions, and all the *économistes* opposed Galiani. Further, the French government gave MORELLET the task of refuting him. The attempt was published three years later.

In the history of economic doctrines, Galiani has the great merit to have remarked in the 2nd edition of *Della Moneta* (1780) on the great importance of the work of Antonio SERRA, *Breve trattato delle cause che possono fare abbondare i*

regni d'oro e d'argento dove non sono miniere, Napoli, 1613, which every one had unjustly forgotten. A. B.

GALITZIN, DIMITRI, Prince (1730-1803). From 1765 to 1772 he was Russian ambassador in Paris, where he met on friendly terms QUESNAY and other members of the school of the PHYSIOCRATS. On leaving Paris he occupied the Russian embassy in the Netherlands, and retired to Germany, where he died, after the outbreak of the French Revolution.

To vindicate the memory of his former friends, Galitzin published, in 1796, at Brunswick, a book entitled *De l'Esprit des Économistes ou les Économistes justifiés d'avoir posé par leurs principes les bases de la Révolution française* (The spirit of the Economists, or the Economists not guilty of having laid, by means of their principles, the foundation of the French Revolution). E. Ca.

GALLATIN, ALBERT (1761-1849), an American statesman and writer, was born at Geneva in Switzerland, and emigrated to the United States in 1780. He was active in the state (Pennsylvania) and federal legislatures from 1789 to 1801, and became secretary of the treasury in 1801. He served in that capacity with distinguished success until 1813. In 1814 he took a leading part in negotiating the treaty of Ghent, by which the war between the United States and Great Britain was brought to an end. From 1816 to 1823 he was minister to France, and in 1826-27, minister to England. In the later years of his life he was president of a bank in New York, where he died. His character was singularly pure and noble, and his career marked by unfailing public spirit combined with rare good sense.

Gallatin's official writings on economic and financial subjects are voluminous, consisting of his reports as secretary of the treasury, and of other state papers and speeches. All are marked by sound judgment and perfect accuracy of statement, and are material of high value on the industrial and financial history of the United States. The same qualities appear in his un-official writings, a list of the more important of which is subjoined. In the two pamphlets on currency and banking, published in 1831 and 1841, he gave sketches of the currency history of the country, which are the best sources of information on that period; and he urged strongly the maintenance of specie payments. It is noteworthy that the function and importance of deposit banking as virtually supplying currency received adequate recognition at his hands. In the memorial which he drew up in 1832 on behalf of a free-trade convention, he presented with force the argument in favour of free trade, showing in his treatment of the subject signs of the influence of the Ricardian school.

Gallatin's life has been fully written by Mr. Henry Adams (*Life of Gallatin*, Philadelphia, 1879). The same author edited at the same time three volumes of Gallatin's works, the third of which contains most of those enumerated below, and gives also a complete list of all Gallatin's public and private writings. The more important of his unofficial writings are:—*A Sketch of the Finances of the United States*, New York, 1796. —*Views of the Public Debt, Receipts, and Expenditures of the United States*, Philadelphia, 1800.—*Considerations on the Currency and Banking Systems of the United States*, Philadelphia, 1831.—*Memorial of the Free Trade Convention*, New York, 1832.—*Suggestions on the Banks and Currency of the several United States, in reference principally to the suspension of specie payments*, New York, 1841. F. W. T.

GAMBRINI, FRANCESCO (early 19th century), born at Asti in Piedmont.

In his work, *Delle Leggi Frumentarie in Italia*, 1819, Gambrini defended free trade in corn and free trade in general, opposing the system of protection to manufactures by forbidding the export of raw materials and imposing heavy duties on the import of manufactured articles. Nevertheless he considered a protective system justified if it prepared domestic manufactures against a time when they could compete with foreign countries. *Osservazioni sulla proibita estrazione della seta greggia dal Piemonte* (*Racc. di opere di Econ. Pol. di Aut. Piem.*, p. 144). A. B.

GAME LAWS. These laws are an artificial arrangement for the purpose of securing to owners of land the game on their estates, which, by the common law, is not, while living, capable of being property. In this respect the common law is founded on the civil or Roman law. In the view of Roman lawyers, wild or undomesticated animals were *res nullius*, the property of no one, until killed or captured, when they became the property of the captor, no matter on whose land they might have been taken (Inst. II. 2). If they were caught and confined they became property only so long as they were in actual detention, but if they recovered their liberty they again became *res nullius*. Even if tamed, animals *feræ naturæ* were the subject of property so long only as they were either on the owner's estate, or retained an *animus revertendi* to it, and if that did not exist, they became subject to the right of appropriation as if wild. These rules were carried still further by the Anglo-Saxons, whose presumption in favour of equality of rights led to the prohibition of keeping wild animals in confinement for purposes of pleasure, because by so doing they were abstracted from the common right of all to kill them. But the Norman love of sport, and their introduction of the feudal principle, gave a new development to these doctrines. Game continued to be in law not a subject of property, but the right to pursue it became a privilege vested only in the landowner, and pre-eminently in the sovereign as lord paramount. In particular the right to confine animals of

chase within certain bounds was limited to the sovereign and to those private individuals on whom he bestowed the right—by grant of privilege of a "forest," in which the forest laws prevailed; of a "chase," where game might be preserved, but without protection of the forest laws; or a "park," in which game might be confined by a fence. The "forest laws" were a code established by the arbitrary decree of the Conqueror and his immediate successors, which inflicted fines, mutilation, and death on all who might hunt within the limits in which it applied. The severity of this code caused deep murmuring, and it was restrained both by the Great Charter and by the *Charta de Foresta* (1217). (See FORESTS, MEDIÆVAL.)

A series of game laws gradually took the place of this code of privilege, and these were consolidated by the Night and Day Poaching Acts, 9 Geo. IV. c. 69, 1 & 2 Will. IV. c. 32, and 2 & 3 Will. IV. c. 68, which now form the principal enactments framed for preservation of game. These still proceed on the basis that game is not property, and therefore the taking of it alive is not theft. But they convert trespass, which by itself is not criminal, but only gives room for a civil action for damages, into a criminal offence, if it is for the purpose of taking game. The offence during day is punishable only by fine, but the taking of game by night is punishable by imprisonment with hard labour for three months, six months, and two years, or even penal servitude for seven years for a first, second, and third offence. There are further penalties for aggravation by resistance, etc., and the 7 & 8 Vict. c. 29 applies the rule to highways. The game thus protected by night are hares, pheasants, partridges, grouse, heath or moor game, black game (these two latter are the same), and bustards. The Day Act applies, in addition to these, to deer, roe, woodcock, snipes, quails, landrails, wild ducks, and conies. The 25 & 26 Vict. c. 114 entitles policemen to apprehend and search any person suspected of having game in his possession. In addition to these restraints it was formerly unlawful for any one to kill game, even on his own ground, unless he were possessed in England of an estate of £100 a year (22 & 23 Car. II. c. 25), and in Scotland of a "ploughgate" of land. But the necessity of a qualification was abolished by 1 Will. IV. c. 32, and in its place was substituted the requirement to take out a licence. The present statute is the 23 & 24 Vict. c. 90. The 11 & 12 Vict. c. 29 relieved occupiers of this obligation as regards the killing of hares, and as regards both hares and rabbits the Ground Game Act, 1880, declares that the tenant of lands shall have a right of killing which he cannot contract himself out of. There is also a close time appointed by 13 Geo. III. c. 54, during which the killing and selling of game is illegal.

Such are the leading provisions which constitute the code of game laws. As there is no moral question involved in their principle, whatever may arise out of their exercise, the policy must be judged on grounds of expedience and public advantage. Two arguments may be stated in their favour. In the first place they adapt to modern conditions ancient rules of law which have ceased to be applicable. In a sparsely-inhabited country the doctrine that wild animals are no man's property is reasonable. But when every inch of ground has its owner, and every plant is private property, it is pedantic to affirm that animals which live and die on private land, and are wholly fed on private property, become public because they have the power of flying or leaping over the fences which separate one private property from another. Common sense would suggest that they should be recognised as part of the property of the landowner on whose territory they are for the moment, and that their being taken by another person is as much stealing as the appropriation of a sheep or turkey. But in the second place there is the plea in favour of the game laws that by encouraging sport they encourage the residence of owners on their estates; the advantage of which to the community cannot be disputed. But these arguments are met by others of undeniable force. Human nature has not confined the love of sport to the breasts of landowners, or of rich men who can hire their rights. It exists as deeply in the hearts of poor men; and no enactments can convince them that its indulgence is a crime. Further, the excessive preservation of game, which the game laws foster, makes poaching a very profitable pursuit. At the same time the valuable animals thus multiplied are somewhat in the position of a shopkeeper's goods exposed outside his door instead of within his window: they are not in a place of safe custody, watched over by regular attendants, so that the temptation to take them is enhanced by apparent negligence and the prospect of carrying them off without detection. It is against public policy to foster in this manner temptations to crime, and most of all to offences which are artificially created by law. The impolicy is heightened by the fact that those yielding to the temptation are often brought into situations where in self-defence they commit murder or are themselves murdered.

The economic effects of preservation of game have been often exaggerated on both sides. The advocates of the system urge that a large amount of food is produced and a great deal of employment given. The opponents insist that crops are destroyed, land thrown out of cultivation in order to form preserves, and agricultural employment diminished. Excluding deer forests from view for the present, the mischiefs on both sides have been practically much re-

duced in amount by the effect of recent agricultural depression. This fact has given to tenants in general an increased power of making their own conditions, among which moderation in the preservation of game is not one of the least essential. There are probably not now many farms in which any considerable amount of damage to crops arises from game. The actual preserves are mostly within parks, partly grazed by cattle and sheep; and in woods, which under present circumstances return as much profit from timber as the land would if under cultivation. Nor can any reasonable person think it desirable that sylvan scenery should be utterly abolished in England, even if a small addition to the supply of human food were thereby attained. The number of keepers is also not greatly less than the number of agricultural labourers would be.

The case of deer forests (which are really treeless tracts of mountain heath) is, however, peculiar in its circumstances. If the deer were limited to the higher ranges, in which culture is unprofitable, the small number of sheep and cattle which they would displace would be scarcely worth computation. But of late years rich strangers have offered tempting rents for immense ranges of country, including a proportion of fertile glens, with the view of driving out the existing population on the pretence that their presence frightens the deer away. The pretence is unfounded, for deer soon become reconciled to the sight of those who do not molest them. But even if it were true it would be contrary to sound national policy to allow a wide district to be depopulated for the sake of yielding sport to a rich man. A royal commission in 1895 investigated the extent of land suitable for crofter holdings or common pasture, which it stated at 1,700,000 acres, but there does not appear to be any statement of the total area comprised in deer forests.

[Rich. Griffiths Welford, *The Influences of the Game Laws*, 1846 (Extracts from Evidence before House of Commons Committee, Speech of Bright, etc.).—Shaw Lefevre, *Freedom of Land*, 1880.—*Report of Highlands and Islands Commission*, 1895. J. B. K.

GAMING CONTRACTS. A gaming or wagering contract "is one by which two persons professing to hold opposite views touching a future uncertain event mutually agree that, dependent upon that event, one shall receive from the other, and the other shall pay or hand over to him, a sum of money or other stake; neither of the contracting parties having any other interest in that contract than the sum or stake he will so win or lose, there being no other real consideration for the making of such contract by either of the parties." (Justice Hawkins in Carlill *v.* Carbolic Smoke Ball Company (1892) Queen's Bench 484). Contracts of this description are declared to be null and void by an act passed during the present reign (8 & 9 Vict. c. 109, p. 18). Notwithstanding this act it was held that a betting agent who had paid the amount due by his principal on the loss of a bet was entitled to recover the same from the latter (Read *v.* Anderson, 10 Queen's Bench Division 100; 13 Queen's Bench Division 779), but this indirect recognition of betting transactions has lately been set aside by the Gaming Act of 1892, which enacts that no action shall be brought to recover any sum of money paid in respect of any gaming or wagering contract. The subject of gaming contracts has recently been discussed with reference to the "missing word competitions" organised by certain newspapers, which were held to be illegal, as the result did not depend on skill and judgment but upon mere chance (Barclay *v.* Pearson—1893—2 Chancery 154). The principle of the statute against gaming and wagering contracts was, to a certain extent, already recognised by the statute of 14 Geo. III. c. 48, which forbids the insurance of a life in which the insurer has no interest, and which is still in force.

Much discussion has taken place both in England and abroad on the question whether certain time bargains on the stock exchange and in the produce markets are to be considered as partaking of the nature of wagers, and the result of the decisions seems to be that a contract is not enforceable where it can be proved that it was not the intention of the parties to deliver or receive a certain quantity of securities or produce at a certain price, but that the payment of the difference between the price at which the bargain was made and the market price at the time fixed for the completion of the bargain was the sole object of the transaction; in the absence of such proof the parties must be presumed to have intended a real sale (Grizewood *v.* Blane, 11 Common Bench 526; Thacker *v.* Hardy, 4 Queen's Bench Division 685—see also the decision of the German *Reichsoberhandelsgericht*, vol. 6, p. 224, and of the German *Reichsgericht Entsch. in Civilsachen*, vol. 12, p. 16, and vol. 30, p. 214).

In France time bargains are not always considered gaming contracts (see the decision of the Court of Appeal at Dijon, dated 18th May 1891, reported *Dalloz Recueil périodique*, 1891, II. 384) (cp. also LOTTERIES). See Vercamer, *Étude Historique et Critique sur les Jeux de Bourse et Marchés à Terme*, Paris, 1903. E. S.

GANGS, AGRICULTURAL, also called "public gangs," are to be distinguished from "private gangs," organised by the farmer himself who employs them, and superintended by one of his own men who works with them. The public gangs are engaged by an independent gang-master, who makes his own terms with the women or boys who compose them, and sees a certain amount of agricultural work executed for a farmer, who pays by the piece. The system is to be found throughout the Fen district. In 1865 it existed in the counties of

Cambridgeshire, Huntingdonshire, Lincolnshire, Nottinghamshire, Norfolk, and Suffolk, and was the direct result of the enclosure of wild land without providing an adequate number of cottages for resident cultivators. This enclosure went on with great rapidity in the two last decades of the reign of George III., and, combined with the unreformed poor law, which rated the parish rather than, as now, the union of parishes, and therefore discouraged landowners from keeping cottages, lest, as was said, they should become "nests for beggars' brats," made it necessary for occupiers of land to look elsewhere for the labour they needed. The Poor Law Union Chargeability Act (1865) altered the condition of affairs to a certain extent, but the expenses of cottage-building and repair have partially replaced the evil then removed. The moral evils to which these gangs led, particularly in a part of England which, being exceptionally free from fences or hedges, admitted of a strict look-out being kept by the culprits against observation, and the physical ruin caused to the employees, were so great that in 1865 Lord Shaftesbury, supported by the then Bishop of Lincoln (Dr. Jackson) and Earl Granville, carried an address from the House of Lords to the Queen for including agricultural child-labourers in the scope of inquiry by the children's labour commission, appointed in 1862, and then sitting. They reported in 1867 that under the public gang system the payment of children according to their age and abilities, and the adjustments of work to their powers, were studied to a great nicety. There were, however, many children employed far too young, and the distances they had to travel on foot led to appalling cruelty. The preponderance of evidence as to a well-regulated system, however, showed that the exercise was good for the health of the elder children, and many medical men said the same also of the effect on the women. On the other hand the gross immorality and general coarsening of character, the obscenity and uncleanliness grafted on the young women by the irregularity and vagrancy of the life, were testified to almost universally by labourers, farmers, and ministers of the Gospel. The report of the commissioners startled the public with its revelations. The result was the passing, 20th August 1867, of an act which forbade the employment of any child under eight years old, of any female in the same gang with males, and since 1894 of any female under a male gang-master unless a licensed gang-mistress were also present. Gang-masters must be licensed by district councils, and may not hold a liquor license. The distances to be travelled on foot by the gang are to be fixed by the councils, and each license must be renewed every six months. These enactments have been made more stringent by the Education Act 1870, which forbids the employment of any child under the age of ten, or under fourteen without a certificate of school proficiency. The work done with the gang varies with the different months, and ceases during harvest time. It consists principally of weeding, picking twitch, singling turnips, gathering stones, spreading manure, setting potatoes, selecting seeds. The advantages of the system are the training of the young to agricultural work, the securing of occasional extra hands for the farmer, and of extra wages for the cottage home, and in the case of the boys at any rate, the healthy effect of outdoor exercise. What disadvantages remain since the regulation by the act of 1867 are the usual mischiefs arising from the herding of twenty to thirty children together, and their possible subjection to an excessive amount of labour where it is the interest of their employer to "drive" them too fast; the danger to women's health in particular, from cold and exposure, and strain, and the harm arising to their homes by their absence; and possibly the discouragement of adult male labour by the competition of the gangs. Happily the general improvement in education and refinement among agricultural labourers' families is gradually causing all women, except widows who have no breadwinner, to refuse such labour, the conditions of which are quite unlike the annual hiring of whole families to work together, as in Northumberland. When, however, the councils really exercise their right of choice, and appoint as gang-master only a man who is at once skilled in the treatment of land, firm in command, and gentle in discipline, gangs seem to form a basis for just that technical training which is needed in our rural districts. The Education Acts wisely prevent parents from withdrawing their sons from school till they have learnt to read and write. The literary education thus being guarded, the state may possibly find in the gang system the nucleus of a technical education which, bringing in a little to the home, would not be unpopular. It is far otherwise with the employment of the future wives and mothers of England in labour which unfits them for domesticity. There are (1905) in Norfolk 14 licensed gang-masters, 2 gang-mistresses; in the Isle of Ely (1905) 10 such licenses issued by Wisbech Rural District Council.

GANILH, CHARLES (1758-1836), a French economist and financial writer, was born in Allanche (Cantal) and moved early to Paris. During the period of the Revolution and the

subsequent rule of Napoleon he held various public offices.

He was a mercantilist with considerable modifications, due no doubt largely to his extensive acquaintance with the economic literature of his own time, of which he wrote a history, probably his most important work.

Among his writings were : *Essai sur les revenus des peuples depuis l'antiquité* (1806).—*Des systèmes d'Économie politique* (1809).—*Réflexions sur le budget de 1814* (1814) ; *Théorie de l'économie politique, fondée sur les faits recueillis en France et en Angleterre*, etc. (1815).—*Considérations générales sur la situation financière de la France en 1815* (1815).—*Considérations générales sur la situation financière de la France en 1816* (1816).—*De la législation, de l'administration et de la Comptabilité des finances de la France depuis la restauration* (1817). E. C. K. G.

Ganilh also wrote a *Dictionnaire analytique d'Économie politique*, published at Paris and Brussels 1826. This work is very restricted both in its range of subjects and in its method. *Exportations* has only two pages allotted to it, while *Demande* and *Offre*, which form two separate articles, have scarcely more than one page between them. Perhaps the main use of the volume to the modern reader is to remind him of the subjects most under public notice at the time when it was written. M'Culloch refers to this book slightingly in his *Literature of Political Economy*.

GARBLED COIN. A term used by bankers to indicate coins which have been sorted out from those in general use. To "garble" coin means to select from a number of coins those pieces which are required for a particular purpose, such as, for instance, to melt into bullion or to send to a mint for recoinage. F. E. A.

GARDINER, OR GARDNER, RALPH (*b.* 1625), son of Devereux Gardiner of Newcastle-on-Tyne. His father appears to have been an attorney, but failing in this profession, he became writing master at Queen Elizabeth's Grammar School, Newcastle. In 1650, Ralph Gardiner was established as a brewer at North Shields, and so infringed the monopoly of the Company of Brewers and Bakers of Newcastle. He maintained that the charters which conferred their privileges were contrary to the statute-law of the kingdom, and therefore of no authority. Throughout his life he carried on a struggle with the companies in defence of this principle. In 1650-51 the bakers and brewers warned him to cease brewing and brought several actions against him. Gardiner, however, took no notice of them, and in August 1652 he was arrested, "actions being laid for nine hundred pounds, when twenty pound could not be recovered, and he kept lockt up in a prison, from all comforts, in a tower above 36 foot high." His bail was at first accepted, but afterwards refused, and he was not allowed to defend his own cause. In February 1653 he escaped from prison ; in the following August he was again arrested by the constables of Newcastle corporation, but rescued by the sailors. Shortly afterwards he was imprisoned, and on 29th Sept. 1653 he addressed to parliament a petition which was referred (5th Oct.) to the committee on trade, and (18th Oct.) ordered to be taken into consideration on 15th Nov. The mayor and burgesses of Newcastle, however, asked for a delay of fourteen days, which was granted ; but on 18th Nov. many of the witnesses were examined. On the application of Samuel Hartlib, solicitor to the corporation, proceedings were deferred until the 13th Dec. Unfortunately for Gardiner, Cromwell dismissed the long parliament on 12th Dec., and so his case was not heard. He was at this time still in gaol, but shortly afterwards appears to have regained his freedom. On 15th Dec. 1656 a committee of the common council was appointed to consider his charges against the corporation. A certain Ralph Gardner, hanged at York for coining on 30th March 1661, has been identified with the subject of this notice. But there can be no foundation for the charge, for Gardiner was still carrying on his business in 1662-63.

Gardiner published *Englands Grievance Discovered in relation to the Coal Trade ; the tyrannical oppression of the Magistrates of Newcastle ; their Charters and Grants ; the several Tryals, Depositions, and Judgments obtained against them*, etc., London 1655, 4to. Much of this work was written in prison. It contains much useful information on the Newcastle coal trade and the conservatorship of the Tyne ; but it is chiefly valuable as a record of the relations between the exclusive corporations of the 17th century and the private trader. *The Plea and Defence of the Magistrates of Newcastle against the allegations of Ralph Gardiner, as exhibited by him before Parliament in 1653*, published in 1848 in vol. iii. of Richardson's Reprints of Rare Tracts. *Englands Grievance*, etc. was republished in 1796, and again, at North Shields, in 1849, when a life of Gardiner and copious notes were added.

[Life of Gardiner in the North Shields edition of *Englands Grievance.—Memoirs of Ambrose Barnes* (Surtees Society), pp. 215, 369.]

W. A. S. H.

GARELLI DELLA MOREA, GIUSTO EMANUELE (died 1893), an economist and jurisconsult, and professor at the university of Turin; an able writer, well known in Italy for his school compendiums. He supported liberal principles and the theories of the classical economists.

His most important works are *Principii di Economia Politica*, Roma, 1881, 2nd ed.—*Scienza delle Finanze*, Torino, 1888. A. B.

GARFIELD, JAMES ABRAM (1831-1881) was born in Orange, Ohio. He entered political life in which he rapidly advanced, and was elected president of the United States in 1880 ; he was assassinated while in office. His speeches, which reflect the economic opinions of the Republican party between the Civil War and

1880, have been collected: *The Works of James Abram Garfield*, edited by Burke A. Hinsdale, 2 vols., Boston, 1882. Garfield had a special interest in the success of the ninth (1870) census, for which see his *Speeches*, 6th April and 16th December 1869. He also contributed an article on the "Census" to the first edition of *Johnson's New Universal Encyclopædia*; republished in *The Works*, etc., vol. ii. pp. 185-217. The same subject, *The American Census*, is treated in a paper read before the American Soc. Sci. Assoc., published in *Transactions*, No. 2, 1870, pp. 31-55, also more exhaustively in *Report of the Committee on the Ninth Census*, House of Rep. 41st Cong. 2nd Sess., 18th January 1870, pp. 120. D. R. D.

GARNIER, Comte Germain (1754-1821), was born at Auxerre and died at Paris. Up to the date of the revolution he had given no sign of being the economist he afterwards became. An Anacreontic poet, he was well known through his society verses, some of which are among the classics of that order of poetry. It was not till 1790 that he began life in earnest. He declared himself a warm supporter of the monarchy, and in that character won the confidence of Louis XVI., who offered him office, which he declined to accept. After the 10th August 1792 he emigrated to Switzerland, and did not return to France till 1795. A year later he published his *Abrégé des principes de l'économie politique*, 1 vol. 12mo, a work which, considering its date, is not without merit. His adhesion to the *coup d'état* of the 18th Brumaire gained him the prefecture of the departments of Seine and Oise, a post which he exchanged in 1804 for a seat in the senate; and he was president of that body from 1809-1811. We need not dwell on other official posts which he held; these, though lucrative, were rather dignified than laborious. It may be mentioned that he employed the time which they left at his disposal in his favourite studies of economics and finance. He was thus led to publish in 1805 his translation of Adam Smith's *Wealth of Nations*, 5 vols. 8vo, the best in the French language. It should be added that a second edition of this translation appeared in 1822, 6 vols. in 8vo, one volume being notes, the object of which is to refute Adam Smith from the point of view of the physiocrats. A third edition was published by Guillaumin, under the care of Adolphe Blanqui and of Eugène Buret, 2 vols. gr. in 8vo, 1843. Garnier's feelings of gratitude towards the imperial regime did not hinder him from voting in 1814 for the deposition of Napoleon I. This led to his being appointed a peer of France by Louis XVIII. He held aloof during the Hundred Days, and was, in consequence, appointed a minister and a member of the council of state as soon as the king returned to France. The empire had made him a count; the restoration made him a marquis. Justice to the memory of Garnier requires us to remember that he defended free trade in corn, and the freedom of the press in the chamber of peers. The other works of Garnier did not rise to the level of his translation of Adam Smith; though interesting, considering the time when they were written, they did not maintain the reputation which that work had won for him. The following are the titles of the most important: *Théorie des banques d'escompte*, 1806, pamphlet, 8vo, and a *Histoire de la monnaie*, tracing this subject from the earliest ages to the time of Charlemagne, 2 vols. 8vo, 1818. This last work was composed by putting together various papers read at the Institute in 1817 and 1818. As a peer of France, he wrote several reports, ephemeral in character, dealing with subjects of the day. A. C. f.

GARNIER, Joseph (1813-1881), was born at Beuil (*Alpes maritimes*) and died at Paris. Sprung from a family engaged in agriculture, who were comfortably off, he made his way to Paris a short time before the revolution of 1830. He was on the point of entering the banking house of Jacques Laffitte, when, being warmly received by Adolphe Blanqui, who had just taken in hand the direction of the *Superior School of Commerce*, founded in 1820, he determined to enter that model institution, in which he was successively pupil, secretary to the governing body, assistant master, and finally professor. His energy led him to seek a wider field, and he became a contributor in 1835 to the *National*, managed at that time by Armand Carrel, and the scientific bulletin of that journal was entrusted to him. He also contributed, between 1835 and 1839, to the *Dictionnaire du commerce et des marchandises*, published by Guillaumin. He continued his contributions to this work, which became in 1861 the *Dictionnaire universel du commerce et de la navigation*. He attended regularly the lectures of Blanqui in the *Conservatoire des arts et métiers*, and reproduced the course with the assistance of Ad. Blaise (of the Vosges) between November 1836 and August 1838. They formed three volumes 8vo of a collection the fourth volume of which was entirely from the pen of his fellow-labourer. After this he established in 1838 a technical school of trade and manufactures. He had, however, no special aptitude for this work, and on it he expended, fruitlessly, six years of his life. The failure of this effort weighed heavily, from a pecuniary point of view, on the years which followed. But Garnier set himself with courage and determination to wipe out all traces of this unsuccessful step. He returned to his favourite occupations, and in November 1842 founded, with the assistance of other rising economists, the *Société d'économie politique*. In 1843 Garnier commenced a course of lectures on political economy at the

Athénée (rue de Valois), an institution similar in character to the existing polytechnic and philotechnic associations in France.

After this date the productions of Garnier's pen were numerous. These works were of various forms, some being his own individual productions, while some were written in concert with others; but all of them equally were devoted to the explanation of the theory or the practical application of political economy. He edited the *Annuaire de l'économie politique et de la statistique*, which had been established by Messrs. Guillaumin in 1844, from that year till 1855. In 1845 he became the principal editor of the *Journal des économistes* (established in 1842), which post he did not quit till 1855, resuming it in 1866 and retaining it thenceforward till his death. In 1853 he undertook the management of the *Nouveau journal des connaissances utiles*, but gave it up in 1860. We have thus described the principal works which Garnier undertook in connection with others in the course of his busy literary life. We will now revert to those which are exclusively personal to himself. He published, in 1845, the 1st edition of his *Éléments d'économie politique*, the title of which, after the 4th edition in 1860, was altered to the *Traité d'économie politique*, now in its 9th edition (1889). This work alone would have made the name of Garnier famous. It forms in reality an encyclopædia of economic science; methodical order and deep knowledge of the subject being alike conspicuous in it. And it should be added that the author has shown a perfect power of appreciating those opinions which are opposed to his scientific convictions. Garnier grafted on this treatise other works more or less distinctly connected with it. Thus he wrote his work *Du principe de la population* (1857), the 2nd edition of which appeared in 1885 after the writer's death; *Les éléments des finances* (1858), which was developed, after the 2nd edition (1862), into *Le traité des finances*, the 4th edition having been published in 1883, also after his death; followed by *L'Abrégé des éléments de l'économie politique* (1859), a very succinct compendium of his great treatise. This had reached in 1884 its 6th edition. His last work was *Notes et petits traités* (1865), a collection containing among other things the 3rd edition of his *Éléments de statistique*.

It was Garnier to whom Guillaumin entrusted in 1845 the work of annotating his edition of the *Principles of Population* by Malthus. In 1848 Garnier also collected in one volume all the speeches made and the opinions expressed on the subject of the *Droit au travail*, a point of doctrine dear to the socialists. Garnier was able to prove, by a simple and impartial reproduction of the opposite opinions expressed concerning it, that there was no sound basis for this doctrine. Besides these works his *Traité complet d'arithmétique théorique et pratique*, the foundation of which was laid when he commenced work in the school of Blanqui, bears testimony to his constant desire to be of service, in however humble a manner, to the cause of commercial teaching. This work reached its 4th edition in 1887. In 1846 a professorship of political economy was established for him at the *École des ponts et chaussées*. He held this till his death, as he did also the similar professorships at the *École supérieure de commerce*, at the *École commerciale de l'Avenue Trudaine*, and at the *Collège Chaptal*, etc. Garnier's reputation was European. Several of his writings, especially his most important work, his *Treatise*, were translated into Italian, Spanish, and into Russian, and are employed as the basis of economic teaching. He became, 24th May 1873, a member of the Institute (*Académie des sciences morales et politiques*), in succession to Baron Charles Dupin, and in 1876 the department in which he was born elected him a senator. During the last year of his life he became, by seniority, the president of the *Société d'économie politique* without giving up the duties of permanent secretary, an office which he had held since its establishment in 1845. A. C. f.

GARNISHEE. When a judgment recovered by a creditor against a debtor remains unsatisfied and a debt is due to the debtor from a third party, the creditor can obtain an order from the court requiring the third party to show cause why he should not pay the debt to the creditor. The third party is called the "garnishee" and the order a "garnishee order."

[*Rules of the Supreme Court*, Order xlv.]

J. E. C. M.

GARRATI, MARTINO (c. 15th century), born at Lodi, near Milan. He studied under Bartolo da Sassoferrato, the ablest jurisconsult of his time (1313-1359), and was the best lawyer and scholar among his pupils. He wrote on "Money." Cossa gives the date as 1438.

M. Garrati's dissertation was printed with similar treatises in the compilation *De Monetis*, made by M. Boyss (1574), and R. Budelius (1591), and by G. Tesauro (1609).

"All these writers begin by showing a lively appreciation of the intrinsic value (*bonitas intrinseca*) of coins, which leads to an energetic description of the economic disasters involved in their debasement, and to urgent protests against such practices addressed to the heads of states. But after all they are sure that the value of coins is attached to them by arbitrary enactment (*valor impositus*), and end by defending in cases of necessity a resort to the device of debasing the currency."—Luigi Cossa, *An Introduction to the Study of Political Economy*, 1893, tr. by Louis Dyer, M.A., p. 170. A. B.

GARVE, CHRISTIAN (1742-1798), was appointed in 1768 extraordinary professor of philosophy in Leipsic; owing to his bad health he resigned this office in 1772, and retired to Breslau, his native town, where he resided until the time of his death.

Garve published in 1794-96 the first good German translation of Adam Smith's *Wealth of Nations*, besides several other translations, viz. of Cicero, *De Officiis*, Macfarlane's *Inquiries concerning the Poor*, Aristotle's *Politics*, and Paley's *Moral and Political Philosophy*. He was very fond of translating, and used to say that his own thoughts were only excited when he commented on the thoughts of other writers.

Garve's original (economic) writings comprise various essays on the character of the German peasantry and their relation towards the landlords (*Ueber den Charakter der Bauern und ihr Verhältniss gegen die Gutsherren*, Breslau, 1786), on the relation between moral philosophy and politics (*Abhandlung über die Verbindung der Moral mit der Politik*, 1788), on literary, moral, and social subjects (*Versuche über verschiedene Gegenstände aus der Moral, der Litteratur und dem gesellschaftlichen Leben*, Breslau, 1792-1802), and descriptive contributions on the spirit, character, and government of Frederick II. (*Fragmente zur Schilderung des Geistes, des Charakters und der Regierung Friedrichs II.*, 1788-91).

Garve was a great admirer of Scotch philosophy and Scotch philosophers; he declares HUTCHESON to be a really great philosopher, and FERGUSON'S and SMITH'S books to be "real masterpieces"; still, in accordance with his own views "on the practical dangers of all general maxims," he states his opinion that several of Smith's generalisations only apply to England and France. A man of a quiet and evenly-balanced temper, Garve was adverse to all sudden reforms; for the improvement of the condition of the German peasantry, he expected more from the better and higher education of the landlords than from sweeping state measures. He distinguishes three stages of industrial development: in the first, all men are equally unskilled, and on nearly the same low level; in the second, great local differences arise from the fact that progress is always due to individuals; in the third and higher stage, the tendency is again in favour of equality.

On the subject of trade, Garve expresses the opinion that a completely developed and firmly established trade tends to foster superior morality, because it leaves less room for suspicion and overreaching, as all goods are then exchanged in large quantities and by men thoroughly acquainted with each other's business.

Many of Garve's views are to be found in the introductions which he wrote for his translations; his original compositions supply useful historical information on the state of Germany towards the close of the last century.

[Roscher, *Geschichte der Nat. Oekonomik in Deutschland*, pp. 603-608.] E. Ca.

GASKELL, P. (19th century), author of *Artisans and Machinery*, London, 8vo, 1836, a reprint with some additions of *The Manufacturing Population of England*, London, 8vo, 1833, by the same author. It contains an interesting and apparently trustworthy account of the physical and social condition of the cotton operatives. The writer, as a medical man, speaks with some authority, but is hardly to be followed in his indignation at the regulation of child labour by the FACTORY ACT 1833, or in his prophecy that the time was rapidly approaching when the labour of men would be almost entirely superseded by machinery.

[*The Manufacturing Population of England* is referred to in Plener's *English Factory Legislation*, Eng. trans. London, 1873, 8vo, p. 12 note.] H. E. E.

GASPARIN, ADRIEN ÉTIENNE PIERRE, Count of (1783-1862), began life as a soldier, but abandoned the military service in consequence of a wound he received in 1806, and devoted himself to the cultivation of his extensive landed property in the neighbourhood of Avignon. Under Louis Philippe he was successively made a prefect, minister of the interior, and minister of agriculture; in 1850 he organised, as director, the *Institut Agronomique* of Versailles which was suppressed by the second empire. His principal works are—*Des petites Propriétés considérées dans leurs rapports avec l'Agriculture et le sort des ouvriers* (Paris, 1821); *Recueil de Mémoires d'Agriculture et d'Économie Rurale*, Paris, 1829-41, 3 vols., the first volume being a handbook for the owners of property farmed at a rent, the second on *Métayage*, and the third on the introduction of silkworms into Europe,—the *Coup d'œil sur l'Agriculture en Sicile* (1832), and his *Cours d'Agriculture* (5 vols. 1843-49). The last volume of his *Cours d'Agriculture* gives the substance of his views, opinions, and experiences, embracing both theoretical questions, such as the theory of rent of Ricardo, which he attempts to complete, and purely practical questions, such as the calculation of the cost of production in agriculture, the yield of manures, methods of agricultural book-keeping, etc.

M. de Gasparin is one of the most distinguished modern French agriculturists; his opinions are those of a practical man, looking carefully and objectively at every aspect of a question. Thus, on small and large properties, he writes: "If we have to pronounce on the advisability of large or small properties in a country, let us first remember that, like all other industries, agriculture wants capital, and that the size of an estate must everywhere be proportionate to the average available capital of the tenants (*Cours d'Agriculture*, v. p. 253)." He considers FARMING as superior to MÉTAYAGE, because "the exact and complete distinction between the interests of the landowner and of the farmer affords the powerful stimulus which

has brought cultivation to its degree of perfection. The proprietor is obliged steadily to ameliorate the value of his estate in order to maintain or raise his rent at the expiration of the lease, and the farmer, impelled by competition to pay the highest possible rent, . . . makes use of the largest possible circulating capital and the more advanced methods to secure a profit in his undertaking (*Cours d'Agriculture*, v. p. 302)." Still Gasparin had stated in his *Recueil de Mémoires* (ii. p. 105) that "métayage is not an arbitrary arrangement independent of social conditions, but a necessary contract, wherever the rural population is not in possession of capital," and in his *Cours d'Agriculture*, (v. p. 324) he points out that under this system "both the owner and the tenant have an inheritance to transmit to their family, the former his land, the second his tenure. . . . Inferior to farming as a system of cultivation, *métayage* is superior in many other respects."

Strongly impressed with the importance of the cultivator being sufficiently paid, M. de Gasparin insisted, in his first publication (*Des petites Propriétés*), on the advantage of high agricultural wages: "In countries where the peasant is well fed, high wages are only high in appearance; their high rate is compensated by the strength and energy of the worker" (p. 9). E. Ca.

GASPARINO, Bartolomeo (17th century), a Bolognese theologian.

Gasparino wrote on the measures by which the government in the pontifical states sought to regulate the corn trade. He devoted the first part of his work to the theory of price, and collected the doctrines of the canonists on the Justum Pretium. The altered circumstances of the times induced him to adopt different principles. According to him, price is founded on utility, as well as on supply; therefore he declares the *legitimate price* to be an untrue price when established without considering such circumstances, and when it is not regulated in such a manner as to bring prosperity both to buyer and seller, replacing to the latter the cost of production.

De legitimo et naturali rerum venalium pretio præsertim circa frumenta, Forolivii, 1634.

A. B.

GASSER, Simon Peter (1676-1745). After having studied at Leipsic and Halle, he lectured on law at Halle, and was called by King Frederick William I. of Prussia to the first chair of economy founded in the Prussian dominions, at the university of Halle, in 1727. It is known how intensely the king was devoted to the economic development of his states, according to the methods of the mercantilists. Gasser's purely practical tendencies, and his disinclination to theory, were in strict concordance with the king's personal aims. His writings on law are all in Latin, but he published in German his introduction to the economic, political, and cameralistic sciences (*Einleitung zu den oekonomischen, politischen, und Kameralwissenschaften*, 1729), although he never went beyond the first part, in which he successively deals with state domains, royal dues, taxes, cattle-breeding and rights of pasture, minor agriculture, peasant services and dues, forestry, etc. The book is dedicated to king Frederick William I., "the great *Œconomus*, and still greater soldier."

Gasser is at heart a matter-of-fact man of his time, with no anticipation of a still remote future. The revenue derived from the state domains and royal dues was to cover the civil expenditure; taxation proper, the military expenses. He deems the voting of taxes by assemblies quite useless, as the existing services are well acquainted with what the land can bear, and are better able to remonstrate in case of need. Still he is no blind admirer of the king's favourite *Plus* (bonus) policy, as he knows "things which cannot be estimated in money."

He observes of theoretical rules, that in their application a great deal always depends on personal skill and ability, and judiciously lays stress on the fact that the various parts of the kingdom being very unequally developed, each must be dealt with according to the level it has reached. His clear practical insight also leads him to take a discriminating view of the relative merits and demerits of extensive and intensive agriculture: tillage with oxen is cheapest and safest in some places and with horses in others. He has a strong bias in favour of large family estates and trusts (*fideicommissa*) (see Fideicommissum), and although he confesses that the peasantry were heavily burdened, he objects to a policy of alleviation of their burdens, and prefers to leave things as they were.

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, pp. 371-376.] E. Ca.

GAUDIN, Martin Michel Charles. See Gaëta, Duke of.

GAUGER, the name by which the exciseman was some years ago not unfrequently known, is a term of considerable antiquity. It occurs in 5 & 6 Edw. VI. ch. 16, and again in 12 Car. II. c. 23; so that it was legally recognised as an official title: it was used as such in the old form of commission to officers of excise. It is obviously derived from the duty of gauging or measuring casks of wine or spirits which was first established by 27 Edw. III. (1352). It is found in Scott *passim*, and was used by Burns, but it appears to have fallen into disuse since the passing of the Act 12 Vict. c. 1.

C. A. H.

GAUTIER, Jules (1781-1858), was born at Bordeaux and died at Paris. He began life in trade, and became a deputy for the Gironde in 1823. He was one of those who signed the "address of the 221" at the breaking out of the revolution of 1830. He became a peer of France in 1832, and sub-governor of the Bank of France in 1833. He was minister of finance for some months (from the 31st March to the 11th May

1839), and finally became a senator in 1852. He was the author of a considerable number of official reports, but the work which won him his greatest reputation as a liberal economic thinker—liberal, considering the period when he lived—is his book *Des banques et des institutions de crédit en Amérique et en Europe*, 1839, 1 vol. large 8vo. "A system of free competition is no doubt more favourable than any other to the progress of trade. The absence of every fetter and restraint, absolute liberty in fact, marks the soil in which commerce grows the quickest and flourishes the best. It is especially to prudent self-interest that recourse must be had to avoid the dangers with which the course of credit is beset." It was a deputy-governor of the Bank of France who wrote these sentences, and during the time when he held that office. A. C. f.

GAVELKIND. Before the Norman Conquest this term was applied to lands which paid GAFOL or rent, either in money or in kind. The Norman Conquest generally introduced feudal tenures into England. But in some parts of the country land is still held by the customs of gavelkind. In the county of Kent this survival of old customs is the rule, and land is held to be gavel-kind unless it can be proved either that it was never subject to this tenure, or that it has been disgavelled by custom or otherwise. Outside Kent this tenure is a rare exception. The chief peculiarities of gavelkind are as follows :—(1) if the holder died intestate his lands passed to all his sons as co-heirs, without any preference for the eldest; (2) the tenant can alienate at the age of fifteen; (3) estates were deviseable by will at a date when other lands are not subject to testamentary disposition; (4) lands never escheated on conviction of felony.

[Elton, *Tenures of Kent.*—Digby, *History of the Law of Real Property.*] R. L.

GAZETTE. Announcements of an official nature are, in England, made in the *London Gazette;* in Scotland, in the *Edinburgh Gazette;* in Ireland, in the *Dublin Gazette*. Such announcements are evidence as to any matters in which the crown or the government is concerned (see King *v.* Holt, 5 Term Reports, 436), but in the absence of express statutory provisions, they are not in themselves evidence of matters concerning private interests only. As to the dissolution of partnerships, etc., the Partnership Act, 1890, provides (§ 36) that "an advertisement in the *London Gazette* as to a firm whose principal place of business is in England or Wales, in the *Edinburgh Gazette* as to a firm whose principal place of business is in Scotland, and in the *Dublin Gazette* as to a firm whose principal place of business is in Ireland, shall be notice as to persons who had not dealings with the firm before the date of the dissolution or change so advertised." As to the bankruptcy proceedings in England, it is enacted by the Bankruptcy Act 1883, § 132, that "the production of a copy of the *London Gazette* containing any notice of a receiving order, or of an order adjudging a debtor bankrupt, shall be conclusive evidence in all legal proceedings of the order having been duly made, and of its date." E. S.

GEBUR (modern *boor*), an Anglo-Saxon term for a villein. The *Rectitudines Singularum Personarum*, of the 10th century, describes him as doing service, week-work, and paying rent (*gafol* or *gablum*). Vinogradoff thinks that in Norman times the word was inexactly used and becoming obsolete (see GABLATORES).

[Seebohm, *English Village Community.*—Kemble, *Saxons in England*, vol. i.—Vinogradoff, *Villainage in England.*] E. G. P.

GEE, JOSHUA, a merchant, known only by his writings on commerce and manufactures, published 1725-50. In these he expressed a keen anxiety to see the government of Great Britain, in the face of decaying agriculture, declining woollen industry, and Gallicised tastes, intervene more actively to foster and regulate trade and manufacture; that this kingdom is capable of raising within itself, and its colonies, materials for employing all our poor in those manufactures, which we now import from such of our neighbours who refuse the admission of ours. Influenced by Petty, he gave a descriptive analysis of England's foreign trade and also an historical sketch of legislation affecting wool. He proposed that the export of wool be absolutely prohibited, but in a second pamphlet expressed a preference, in order to prevent overproduction and increase of smuggling, for a limited export regulated by a system of local registration. A reply, in general terms, may be read in Defoe's *A Plan of the English Commerce*, pt. ii., with some account of the commodities each country we trade with take from us, and what we take from them, with observations on the balance.

Gee was no mercantilist of the somewhat mythical sort who were supposed to care only for the retention and increase of bullion as such. His great solicitude was to see agriculture and manufactures occupying with profit all the available manual stock in England, a considerable part of which in his day was infesting town and country as beggars and vagabonds. He held this could be at least more promptly and efficiently brought about by protective legislation. The *specific* motive for immediate legislation lay he thought in the fact of Louis XIV. having compelled "The wearing of French manufactures" in France, "which before used to be supplied from England, and turned the trade so much against us"; also in the effect produced by the peace between England and France early in the 18th century, namely, a great influx of English into France, and a consequent diffusion of taste for French fashions and French goods in England.

Gee was a contributor to the *British Merchant*, and is the author of the following :—

The Trade and Navigation of Great Britain considered; showing that the surest way for a nation to increase in riches is to prevent the importation of such foreign commodities as may be raised at home, London, 1729, 8vo.—*An Impartial Enquiry into the Importance and Present State of the Woollen Manufactures of Great Britain, as likewise the Improvements they are capable of receiving*, Lincoln and London, 1742, 8vo.—*The Grazier's Advocate, or Free Thoughts of Wool and the Woollen Trade*, London, 1742, 8vo.

C. A. F.

GEIJER, Eric Gustav (1783-1847), an eminent Swedish historian and poet; appointed professor of history at the university of Upsala in 1817. His principal writings are *Annals of the Kingdom of Sweden* (*Svea Rikes Häfder*, Upsala, 1825), and *History of the Swedish People* (*Svenska Folkets Historia*, Örebrö, 1832); neither of them brought down to his own time. The latter has been translated into English by J. H. Turner (London, 1845). Geijer wrote besides many political and philosophical essays, especially in the *Litteratur-bladet*, a monthly journal edited by himself (1838-39). A series of articles in this journal, on *The Poor-laws and their Bearing on Society*, have been reprinted in English, and published separately (Stockholm, 1840). The "chief purport" of the treatise "is to vindicate the freedom of labour." Geijer traces the causes of the growth of poverty from ancient times, and deals especially with the poor laws of Sweden, but poverty in England is also discussed, and the Poor Law of 1834 is favourably criticised.

[Turner, Introduction to *History of the Swedes*, translated by J. H. Turner, London, 1845; Geijer, *Minnen*, Upsala, 1834.] R. H. H.

GEMELLI, Francesco (1700), a Piedmontese eclectic writer.

He considered agriculture the most important industry in every country. He agreed with Filangieri in theory; he did not go far enough to follow him in complete free trade, though he was willing to admit free trade in corn at home, and to allow a perfect free trade in corn to avoid famine in Europe; but, since an agreement on this point is not probable, he thinks that every sovereign should study the peculiar conditions of his own state. Hence he praises the reforms in Tuscany since it has access to the open sea; he praises the policy followed in England, because the price of corn there is regularly higher than elsewhere.

Rifiorimento della Sardegna, proposto nel miglioramento di sua agricoltura, Turin, 1776.

A. B.

GÉNÉRALITÉ. In 1551 the French king, Henri II., appointed sixteen *trésoriers généraux* to supervise the collection of taxes throughout the kingdom. The district assigned to each of these officials was called a *généralité*. When Richelieu set himself in the 17th century to break down the traditional independence of the provinces, he made use of the *généralités* as the administrative districts of his intendants. Henceforward, until the creation of departments in 1790, the district thus designated was the chief unit of local administration, and when the states-general were summoned for the last time in 1788, the deputies were elected from each *généralité*, instead of from the *bailliage* or *sénéchaussée*. In the 18th century France contained twenty-six *généralités*, and there were also seven intendancies in provinces which had been added to France since the time of Richelieu.

[Gasquet, *Précis des institutions politiques et sociales de l'ancienne France.*] R. L.

GENOA, BANK OF. See Banks.

GENOVESI, Antonio (1712-1769), born near Salerno and died at Naples, took holy orders in 1736. In 1741 he taught metaphysics at the university of Naples. He was intimately acquainted with Bartolomeo Intieri, who induced him to follow Broggia and Galiani in the study of economics; and when, in 1754, by the advice of Intieri and with funds liberally supplied by him, the teaching of economics, then termed mechanics and commerce, was established at Naples, Genovesi was called to the chair. He was "the most distinguished and the most moderate of all Italian mercantilists. . . . Commerce was for him not an end only, but also a means by which the products of industry at large were brought to the right market. He, moreover, distinguished between useful commerce which exported manufactured goods and brought back in return raw material, and harmful commerce which exported raw material and imported foreign goods; he also insisted that useful commerce calls rather for liberty than for protection, while upon harmful commerce the strictest embargo should be laid, or at least it should as far as possible be bound hand and foot" (Cossa, *Introduction to Pol. Ec.*, translation, p. 235).

These ideas, neither new nor original even in his time, were maintained by Genovesi in many of his works, and brought together, but without any systematic order, in his *Lezioni di Commercio ossia di Economia Civile* (Napoli, 1765, e. ii. ediz. 1768-70, 2 vols.). Though the *Lezioni* do not form a regular treatise, they contain the author's opinions on the mercantilist system and the most important principles of economics, which he terms *Civile* "*la scienza che abbraccia le regole per rendere la sottoposta nazione popolata, potente, saggia, polita*" (the science which embraces the laws which make a nation populous, powerful, wise, and cultured), limiting thus the science to the increase of population and the production of wealth.

As to population, Genovesi follows the mistaken principle of his times, exaggerating the advantage of a large population, proposing that government should encourage marriages by granting privileges and honours. He says that the population ought not only to be numerous but supplied with comforts, and he sees the relation between population and means of subsistence or production of wealth.

As a writer he is a mercantilist, though he does not regard money as the only form of riches; he says that the wealth of a nation is quite apart from the quantity of money treasured up.

He derives the idea of value from demand, distinguishing different degrees of demand according to their abstract importance in several categories, maintaining that a thing which satisfies a want repeatedly has a higher value than what satisfies only a few wants or the same only sometimes (*può soddisfare ad un bisogno più volte, ha maggior prezzo che non quella, la quale o non può soddisfare che pochi bisogni o al medesimo qualche volta*). What is able to satisfy a great want is of more value than what satisfies a small want (*una cosa fatta a soddisfare il maggior bisogno si apprezza più che quella la quale non è fatta che a soddisfare ad un minore*); and further he asserts that the quality of things influences the value. Graziani (*Storia della teoria del valore in Italia*, Milano, 1889, p. 108) justly remarks that in this Genovesi approaches the important question which GALIANI answered: namely, why do luxuries generally cost more than necessaries? In this he is obliged to have recourse to the element of scarcity, a line of argument which he does not know how to reconcile with those previously mentioned. Genovesi's want of originality is obvious, as F. Ferrara has shown (*Bibl. dell' Econo.*, 1ª. S. vol. iii. Introduz.) in contradistinction to the exaggerated opinion which Bianchini held respecting him (*La scienza del ben vivere sociale*), since the SOCIALISTS OF THE CHAIR persist, erroneously, in considering him as a precursor of their opinions. This tendency is also attributed to Genovesi, as well as to BECCARIA, VERRI, and ROMAGNOSI by the French socialist B. MALON; which is a further example of the errors of the socialists in their historical criticism of political economy.

"According to Gobbi the Neapolitans FORTUNATO (1760), Strongoli (1783), and VENTURI (1798), belonged to Genovesi's school, and then there was also ZANON of Udine (*Lettere*, 1756-67), Todeschi of Ferrara (*Opere*, 1784) and Marcello Marchesini of Istria (*Saggio d'Econ. Pol.*, Napoli, 1793)."—Cossa, *Introduction to Pol. Ec.*, translation, p. 236.

Besides his philosophical works, Genovesi wrote: *Ragionamento intorno all' agricoltura, con applicazione al Regno di Napoli* 1769 (Scrittori classici italiani di Ec. Pol. Custodi, p. ii. vol. ix.).—*Altro Ragionamento*, ed. (ibid.).—*Ragionamento sul commercio in generale* 1750 (id. vol. x.).—*Ragionamento sulle manifatture* (ibid.).—*Ragionamento sullo spirito della Pubblica Economia* (ibid.).—*Digressioni Economiche* (ibid.).

[For the works of Ferrara, see A. Bertolini, *La Vita e il Pensiero di Francesco Ferrara*, 1895.] A. B.

GENTLEMAN, TOBIAS (fl. 1614), was "born a fisherman's son by the sea-side and spent his youthful time at sea about fisher affairs." He published *England's Way to win Wealth, and to employ Ships and Marriners*, etc. London, 1614, 8vo, Reprinted in the *Harleian Miscellany* (1809), vol. viii. This pamphlet was the result of a conference between the author and John Keymor, whose *Observation made upon the Dutch Fishing about the year 1601*, was printed from the original manuscript, for Sir Edward Ford, in 1664. *England's Way*, etc. evidently owes much to Keymor's investigations. It contains a good description of Dutch fishing in English waters and of the ports on the east coast. The author urges the importance of developing the herring fishery, and attributes the prosperity of the Dutch to their activity in this respect. His tract is frequently quoted with approval by 17th century writers, *e.g.* MALYNES, who gives an abridgment of it (*Lex Mercatoria*, c. xlvii.). W. A. S. H.

GENTZ, FRIEDRICH VON (1764-1832), an eminent German publicist, was born at Breslau. His father was an official of the mint there; through his mother he was connected with the family of the minister Ancillon. He studied at the Joachimsthal Gymnasium at Berlin, to which city his father had been transferred, and afterwards at Königsberg, where he came under the influence of KANT. In 1786 he was appointed secretary of the general directory, and afterwards became Kriegsrath. His life at Berlin seems to have been for some time a dissipated and aimless one; an illness led him to change his course and follow more serious pursuits; and the outbreak of the French Revolution still further awakened his intellectual activity. He was an ardent admirer and well-wisher of the Revolution till repelled by its excesses, when he became its determined opponent, and a warm advocate of the English constitutional system. This change in his opinions is indicated by his translation—a masterpiece in its kind—of Burke's *Reflections* and of the anti-revolutionary writings of MALLET DU PAN and Mounier. He discussed political events and handled financial questions with great ability in several journals—amongst others in the *Neue Deutsche Monatschrift*, a periodical which he founded, and for some years conducted. He also published in 1797 a German version of D'IVERNOIS' work on French financial administration, and in 1801 (in French) an *Essai sur l'état actuel de l'administration des finances et de la richesse nationale de la Grande Bretagne*. The economic views in favour of free industry, which he had learned from Adam Smith, are exhibited in his letter (1797) on the accession of Frederick William III., which is said to have offended the king and hindered Gentz's promotion. He was believed to be in the pay of the British Government, as he warmly applauded their policy; but there can be no doubt that the writings by which he earned their gifts expressed his genuine convictions. What made such pecuniary aid almost necessary to him was the extremely expensive and wasteful management of his private affairs, which kept him in difficulties all his life. He had domestic troubles, due, it is said, chiefly to his own conduct; and, such advancement as was suitable to his powers being no longer open to him in Prussia, he left that country in 1802, and, after residing some months in Dresden where he entered into relations with Metternich, went in the same year to Vienna, where he

became a member of the imperial council. Before settling finally in Austria he paid a visit to England, made the personal acquaintance of Pitt and other leading politicians there, and obtained a regular pension from the British government. We cannot here follow in detail the course of his general political action, which is indissolubly connected with the history of Germany. Up to 1812 he fought, as a literary volunteer, side by side with STEIN as a relentless enemy of Napoleon and his system, and an earnest and uncompromising advocate of German independence. He drew up a number of vigorous and telling memoirs directed against the oppressive policy of France, which, however, for a long time failed to rouse the energies of the Austrian court or to impress upon it the necessity of joint action with Prussia. All through the course of the wars with Napoleon, and in the negotiations which followed them, his ready and powerful pen was in frequent requisition, and all the most important state-papers of the allies were his work. After the peace he exercised much influence on the internal politics of Austria; his tendencies then became retrograde, and he contradicted the principles of his earlier years. He seems to have been affrighted by the growth of revolutionary ideas, and especially by the excesses of democratic journalism; and devoted himself to the support of existing governments, and the maintenance of the restored states-system of Europe. He was employed to draw up the protocols at many congresses of princes and ministers, and became the favoured and richly-rewarded champion of reigning powers, and a resolute antagonist of the spirit of the age. But he felt that this spirit would be too strong for all opposing forces, and towards the end of his career endeavoured to reconcile the principles of legitimacy with the dogma of the sovereignty of the people. To the end he remained true to the liberal economic doctrines he had imbibed from the *Wealth of Nations*.

[Editions of selected writings of Gentz have been published by W. Weich, 5 vols. 1836-38, and by G. Schlesier, 5 vols. 1838-40. His Correspondence with Johannes v. Müller and others has been edited by Prokesch-Osten, Schlesier, and Mendelssohn-Bartholdy. The last-named has also published a biography of Gentz, 1867. In addition to such of his writings as have been already named may be mentioned his *Politische Parodien*, 1799; *Ueber den Ursprung und Charakter des Kriegs gegen die französische Rev.*, 1801; and *Fragmente aus der Geschichte des politischen Gleichgewichts in Europa*, 1804; which last, for the glowing patriotism which it breathes, has been compared to Fichte's *Reden an die deutsche Nation*.] J. K. I.

GEOGRAPHY, COMMERCIAL (CONNECTED WITH GREAT BRITAIN). During the 19th century the world has been passing through an economic revolution utterly without precedent. In spite of the commercial enterprise shown by various European nations in bringing distant countries into touch with each other, up to the end of the 18th century and even during the earlier part of the 19th century each country remained for the most part self-sufficing as regards the chief necessities of existence. The wants of the great mass of slowly expanding populations were supplied through the medium of a vast number of local markets, serving as depôts for the corn and raw material for clothing produced in the surrounding districts. Agriculture and home industries of every description were carried on side by side; it was only the finer species of manufactured articles that found an outlet in foreign markets. Prices varied largely in different districts, according to the varying supplies of the local market. Proximity to a sea-coast, or navigable river, or canal, enlarged the area of supply, but, as a rule, each locality produced what it required for ordinary consumption, and the growth of population was necessarily limited by the enormous difficulty, in the existing state of communications, of drawing its food supplies from a distance. Foreign goods, such as the precious metals, tea, sugar, tobacco, spices, wine, silks, and muslins, which might bear the cost of expensive transport, formed part of the market wares of every European country which had distant commercial dealings, but such foreign products formed but a small portion of the local trade compared with the indigenous products. Even in the United Kingdom, where there were greater facilities for internal movement than in the rest of Europe, land-transport met with almost insurmountable obstacles. A broad-wheeled waggon drawn by eight horses, and attended by two men, took three weeks to carry four tons of goods between London and Edinburgh (*Wealth of Nations*, bk. i. ch. iii.), while a coach took a week or more to go the same distance. Under such conditions, prevailing even in the most progressive countries, stationariness of production and population alike remained the prevailing feature of the economic world. During the present century the ever-increasing application of steam-power to industry has tended more and more to transform the old condition of things; by facilitating the transport of the heavier agricultural products it has brought the interior of every country into touch with the coast, and therefore extended the whole range of commercial dealings. Chicago, for instance, at a distance of 4000 miles, is now much nearer to London than Edinburgh was sixty years ago, and the carriage of a quarter of wheat from Delhi to Liverpool costs now only a little more than half a sovereign. The local market for all the ordinary necessities of life has more and more become part and parcel of the world's market. The poorest British

household may now find its wants satisfied by every quarter of the globe. Its flour may have come from India, its meat from Canada or New Zealand, and the raw material of its clothes from America or Australia.

In effecting this great economic revolution Great Britain has been the chief agency. Her prolonged struggle with the naval and military forces of Europe, organised by the genius of Napoleon, left her burdened with an enormous national debt, but it left her mistress of the seas, able to appropriate the results of the commercial enterprise of Europe, and to augment it with an energy all her own. Without the risk of any European rivalry, she was allowed a free hand in consolidating her Indian Empire, developing her Canadian colony, founding new settlements in Australia and New Zealand, and paving the way for an African protectorate. During the last seventy years she has made good use of her great mineral resources—coal and iron—to establish markets in every quarter of the world. The area of the British Empire, including dependencies, colonies, and spheres of influence, is now estimated by Mr. J. Scott Keltie at about 11,391,000 square miles, more than one-fifth of the whole land area of the globe. It is three times the size of Europe, nearly three million square miles larger than the whole of the Russian empire in Europe and Asia, nearly nine times the size of the German empire at home and abroad; nine million square miles more than the whole of the French dominions, and just about as large as the whole of Africa. This immense territory is inhabited by something like 383,000,000 souls, embracing almost every type of humanity, about the same population as that of all Europe, and constituting from one-fourth to one-fifth of the population of the world. Its products are of infinite variety, and the only supplies which at present its population must draw largely from foreign countries are corn and cotton. The trade of the empire is valued at about £1,700,000,000, about one-third of the trade of all other civilised countries put together. Of this total the trade of the United Kingdom is £1,014,000,000 while £686,000,000 is to be credited to the empire beyond our shores. Of these £686,000,000, about £352,000,000 belong to the 7,000,000 odd square miles of colonies proper, with a population of nearly 14,000,000, mostly whites; and £334,000,000 to the tropical and sub-tropical possessions covering an area of only about 4,096,000 square miles, but with a population of 326,000,000, chiefly coloured. In order to protect the carriage of commodities that circulate between the most distant portions of this widely-scattered empire, Great Britain has found it necessary to hold certain points of vantage along the main sea-routes. Along the quickest route to our Indian empire are to be found the strongly-fortified stations of Gibraltar, Malta, and Aden, the latter garrisoned by Indian troops. The magnitude of our commercial interests in this direction is proved by the fact that the transit trade of Malta amounts to nearly £50,000,000, and that, out of the total number of ships (4257) that passed through the Suez Canal in 1904, 2679 were British, the gross tonnage being respectively 18,661,092 and 12,164,591. The danger to which these interests are exposed from the hostility of Russia or the rivalry of France, has been held to justify the occupation of Cyprus and Egypt.

In India and Ceylon, British shipping has the protection of Bombay and Trincomalee, and in a lesser degree of Kurrachee, Colombo, and Calcutta; and it has been proposed to add to the number of fortified stations. Farther east, Singapore commands the entrance to the Chinese seas, while in those seas Hong-Kong forms the central stronghold of British power. If we take the alternative route to the east round Africa, a similar series of fortified stations at convenient distances from each other is to be seen,—Sierra Leone, St. Helena, Cape Town, and Mauritius. The importance of Cape Town to British commerce cannot be over-estimated. It has been calculated by Lord Brassey that £90,000,000 of commerce centres at or passes this point every year, including £20,000,000 of outward trade to Australia, £13,000,000 to the Cape itself, and portions of the Indian, Chinese, and other eastern trade. But if, as might well happen in the event of a European war, the Suez Canal were to be closed, at least £150,000,000, and possibly £200,000,000 of British trade would be forced to go round the Cape. At the converging points of the two great eastern routes we find the important Australasian stations of King George's Sound, Thursday Island, Melbourne, Sydney, and Auckland. Going westward across the Atlantic we find fortified stations in Halifax, Bermuda, St. Lucia, and Jamaica, and farther south the Falkland Islands, lying on the route round Cape Horn. In the Pacific, Esquimault and Vancouver will conveniently form the basis of protection for the routes opened up to the east by the completion of the Canadian Pacific railway, while the Fiji Islands, supplied by nature with excellent harbours, lie across the path of ships sailing either from British Columbia or round South America to the Antipodes.

The existence of these well-selected stations on all the chief lines of communication is the greatest element of strength in the naval supremacy of Great Britain, and upon their safety in time of war would depend the preservation of British commerce. From these stations would have to be drawn those supplies of coal without which no modern fleet can keep the sea for more than a few weeks. And inasmuch as Great Britain has, in all the ports of the world directly under the control of its government,

adopted the policy of free-trade, and is favoured by no differential tariffs, even where its self-governing colonies have adopted a protective system, it may fairly claim, while guarding its own commerce, to be guarding that of the world at large.

To appreciate the absolute dependence of Great Britain on its commercial relations with the rest of the world, we have only to look at the economic features of its existence. Sixty years ago one-third of its working population consisted of agricultural labourers and one-third of artisans. Now only one-tenth are agricultural labourers, and three-fourths are artisans. As a consequence of this change, Great Britain can no longer feed itself. She has now (1906) to draw more than three-quarters of her supplies of corn and flour from abroad. The United States, Canada, India, Russia, Argentina, Australia, and New Zealand send her corn, maize, and rice. It is the same with her meat supplies. It has been calculated that the quantity of meat food at any time in the United Kingdom is only sufficient for three months. Hundreds of thousands of live cattle and many hundred thousands of tons of meat have to be imported into the country every year from across the sea, the United States, Canada, South America, Australia and New Zealand; even the home supply of eggs, butter, and cheese has to be supplemented from abroad; while the ordinary comforts of every breakfast-table—tea, coffee, cocoa, and sugar, are entirely supplied from each of the four great continents. For these articles of daily existence alone Great Britain has to pay over £190,000,000 to the rest of the world, and if she were cut off from the outside world for even a few days, every household would feel the pressure of a sudden rise in prices. But not merely does Great Britain depend for its daily food on foreign supplies; it largely depends on the same source for its daily wage. With the exception of coal and iron, the raw material of British industry comes chiefly from abroad. Wool is imported to the value of over £20,000,000 from Australia, New Zealand, Africa, South America; cotton to the value of £41,000,000 from America, India, Egypt; wood to the value of £25,000,000 from Canada, Russia, Scandinavia, United States, Honduras; flax, hemp, and jute, to the value of £10,000,000, from Russia, India, and other countries. But it is not sufficient for Great Britain to import food and the raw material of her industries; she has to have access to markets for her manufactured products. About one-half of the British exports consists of more or less manufactured fabrics. The export of cotton manufactures reaches £72,000,000, of woollen manufactures £20,000,000, and of linen and jute £8,700,000; of metals, hardware, and cutlery the exports amount to about £35,000,000, and of machinery to over £18,700,000.

The trade of the United Kingdom itself, excluding exports of foreign and colonial produce, may (1903) be divided into four great portions:—

	Imports.	Exports.
	£	£
With Europe . . .	246,000,000	123,000,000
,, United States . .	128,000,000	21,000,000
,, British Possessions .	151,000,000	127,000,000
,, Other foreign countries	71,000,000	75,000,000
	596,000,000	346,000,000

Great Britain's export trade with Europe is to a very great extent made up of woollen, cotton, and linen manufactures, metals—especially iron and copper—coal, and machinery. To a lesser degree she sends leather, hardware, and chemicals. Her European imports show every possible variety. She takes corn from Russia, Germany, Austria, Turkey, France, Roumania; cattle and meat from Belgium, Holland, Denmark; butter, poultry, eggs from Belgium, Denmark, Russia, Holland, Germany, Sweden, France, Italy; cheese and milk from Switzerland, Holland, Belgium, France. From France, Germany, Italy, Spain, and Portugal she takes sugar, wine, oil, fruit; of the raw material of industry she imports flax, hemp, and wool from Belgium, Italy, Russia; timber from Norway, Sweden, Germany, Russia; lead and iron from Belgium and Spain; of manufactured fabrics she takes silk and woollen from France, Belgium, and the Netherlands.

The commerce between Great Britain and the United States is much less varied in nature than that between Great Britain and Europe. It is almost entirely the exchange of manufactured articles for food or the raw material of industry. The United States sent Great Britain, in 1902, corn and cotton to the value respectively of about £21,700,000 and £29,000,000, and meat (dead and alive) to the value of about £26,000,000. She took in exchange iron, cotton, linen, woollen, flax, hemp, and jute manufactures. The only articles of food she takes from Great Britain are delicacies such as biscuits, pickles, sauces, and marmalade, though she imports sugar and tea from British possessions. The total export and import trade of the United States now amounts to about £542,000,000 sterling, of which about £168,000,000 is with the United Kingdom.

But the trade between the United Kingdom and the United States, though far exceeding the proportions of that between the United Kingdom and any one foreign country, is itself largely surpassed by that between Great Britain and the British empire, amounting to over £276,000,000. At the head of the list stands British India. Great Britain finds there her largest market for cotton goods and yarn, of which the average import amounts to over £18,000,000.

Iron, copper, and machinery make up another £7,000,000, out of the total value of British imports of about £41,000,000. From India Great Britain takes in exchange cotton, jute, seeds, tea, coffee, rice, and indigo. In 1902 one-twelfth of the foreign wheat came from India, and of the tea, which used to come almost entirely from China, more than seven-eighths came in 1902 from India and Ceylon. Of the total trade of India nearly half is with the United Kingdom. The total trade of Ceylon is £15,897,000, and the British share is about £5,793,000. The chief exports, besides tea, are coffee, cinchona, plumbago, and cocoa-nut products.

The trade of Straits Settlements—consisting of Singapore, Penang, and Malacca—is largely a transit trade, but there is also a considerable local trade in the exchange of tin, spices, cutch, gambier, gutta-percha, with the cotton and iron goods of the United Kingdom. The total trade amounts to about £143,000,000 sterling annually, but of this England's share is only between £21,000,000, and £22,000,000. The total number of vessels that cleared at the ports during 1903, exclusive of native craft, was 9519, with a tonnage of 9,213,846 tons. Hong-Kong is the farthest point east in the British Empire, and is the great centre of British commerce with China and Japan. Its trade amounts to about £11,000,000, and of that about £5,600,000 is with Great Britain. The trade of Hong-Kong, like that of Singapore, is chiefly a transit trade carried on by over 23,000 vessels and nearly 16,000 junks.

The commercial intercourse of China is largely with the United Kingdom and the British colonies, and is carried on through the thirty-nine trading ports of the Empire. The exports to and imports from Great Britain amounted in 1903 to over £12,000,000, the former being chiefly of tea and silk, and the latter of cotton, iron, and woollen goods. The import of cotton goods from Bombay is rapidly growing, while that of Indian opium is falling off, though it still remains, next to cotton, the chief import, valued at about £6,000,000. The trade of Japan is of a somewhat similar character to that of China, but its exports are rather more varied. It takes £4,592,000, chiefly cotton and woollen fabrics, iron, and machinery, from Great Britain, but it only exports to it about £2,300,000. Its chief export trade is with the United States and with China.

Turning south, we come to the tropical British dependency of North Borneo, administered by a chartered company, chiefly producing sago, rice, gums, coffee, timber, spices, gambier, gutta-percha, tapioca, and tobacco. Adjacent to it on the north-west are the sultanate of Brunei and the district of Sarawak, which, in addition to their specially tropical products, are said to be rich in minerals, especially coal. Off the coast of Borneo lies the little island of Labuan, which seems likely to become an important naval station in the East Indian Archipelago. Last among our purely tropical settlements in the eastern seas must be mentioned New Guinea, with its still undeveloped resources, waiting the help of coloured labour.

Passing across the Pacific we find many islands belonging to the British empire. There is an export trade with these in copra, guano, sugar, and fruit, and an import trade in hardware, machinery, drapery, bread-stuffs, and timber, principally with Great Britain and her colonies, which has been encouraged by the new sea-route between Vancouver and Australia and New Zealand. In view of the piercing of Central America by a canal, our West India possessions are admirably placed for sharing in the transit trade that would spring up. The competition of the beet-sugar of Europe rendered these islands less valuable than they were, but the removal of the sugar bounties has given them more hope. Besides sugar they export cocoa, cinchona, tea, coffee, and fibres, while their trade in fruit is rapidly developing. The total trade of British West India amounts to about £12,000,000, one-third being with Great Britain. On the South American continent there is only one piece of country under the British flag—British Guiana, and it is the only part of South America secure against disorder. Its trade, similar to that of the West Indies, amounts to about three and a half millions sterling—£1,500,000 with the mother country. With the whole of South America the trade of Great Britain was in 1903 about £55,000,000, having increased considerably during the last decade. The chief exports are animal products and wheat, in exchange for cottons, woollens, iron, and machinery.

We come last to the three great colonial settlements of the British empire in the proper sense of the term—Canada, Australasia, and South Africa. Canada covers an area of 3,745,000 square miles, but the northern portions of it can hardly be regarded as habitable by people of European extraction. Its population is about 5,370,000, and since the opening up of the western portions it has been rapidly growing, swollen as it is by an annual addition of about 80,000 to 100,000 emigrants. Its total trade has now reached the amount of £94,000,000, Great Britain and the United States both sharing in it largely. Its chief exports are timber, cattle, agricultural produce, fish, and minerals, including gold. Its imports are largely manufactured articles, of which it took in 1903 from Great Britain about £12,000,000. Off the coast of Canada is the oldest British colony, Newfoundland. It has only one industry of any commercial value, and that is fishing. Its exports are almost entirely marine produce, amounting to over £1,800,000

sterling. Compared with Canada, the commercial development of Australasia has been remarkably rapid. With a population of only 4,549,000 it has a trade of £174,000,000, of which about £62,000,000 is with the United Kingdom. The British imports into Australasia embrace nearly every article of home manufacture, iron (wrought and unwrought), cutlery, woollen goods, apparel, haberdashery, cotton and linen goods, machinery, paper, books, chemicals, and spirits. In exchange Australasia exports gold, copper, lead, wool, meat, wheat, hides, sugar, butter, and wine. Australasia is the great supplier of wool for the textile industries of Great Britain. Of the total imports of wool into the United Kingdom in 1903 amounting to 604,961,364 lbs., 378,510,995 lbs. came from Australasia.

Africa, though on its northern shores for centuries past taking an important share in the trade of the Mediterranean, has only begun to develop commercially of recent years. Settlements have been made by various European nations along its western and eastern coasts, and in all that portion of the interior which is suited for European colonisation. Great Britain has now, since the war of 1899-1902, the greater part of the continent south of lat. 10°, including Cape Colony, Natal, the Orange River Colony, the Transvaal, and an extensive territory north and west of these. The external commerce of Cape Colony amounted in 1903 to £60,400,000, of which £43,200,000 was with the United Kingdom; while that of Natal, the Orange River Colony, and the Transvaal together was over £57,000,000, more than £34,000,000 being with the mother country. The principal exports of this region are gold, diamonds, wool, hair, hides, ostrich feathers, and sugar. We also hold Nigeria, the Gold Coast, Lagos, Gambia, and Sierra Leone in the north-west, with a trade amounting to about £10,000,000; while our large settlement in the east, including the protectorate of Uganda, Somaliland, and Zanzibar, provides, with Walfisch Bay in the south-west, the remainder of the total export and import trade of British Africa, excluding Egypt, roughly estimated at over £130,000,000, of which more than two-thirds is with the United Kingdom, and a large part with other British possessions. The trade of the territories along the Mediterranean shore is also important. The exports and imports of Egypt amount to about £42,000,000: the export of cotton and cotton seed being about £19,000,000; cereals, beans, and sugar making up the other chief commodities. The trade of Tunis, Algeria, and Morocco makes up another £38,000 000; cereals, wine, sheep, and cattle being the chief exports. The rest of the trade on the east and west coasts may be roughly estimated at £21,000,000.

Of all this vast commerce circulating in the world, England is the centre. Not merely does she pass through her ports a larger proportion of that commerce than any other country, but her ships carry more commerce than those of all the other countries of the world put together. She has also supplied most of the capital for developing railway communications in India, Canada, South Africa, and Australasia, and thereby brought vast territories into touch with commercial enterprise. England has no doubt had great natural advantages. Her climate has facilitated continuous work, her soil supplied her mineral wealth, her insular position safeguarded her; but it is the intelligence, energy, and courage of her people that have won for her in the past a commercial supremacy unique in the world's history (see COMMERCE, BRITISH; COMMERCE). This supremacy is now, however, threatened, and attention is being earnestly directed towards maintaining it, better commercial education and tariff reform being discussed with that object.

GEOMETRICAL RATIO OR PROGRESSION. Three or more quantities are in geometrical progression when, as in cases of sums of money at compound interest, each after the first is equal to the preceding one multiplied by some constant factor. For example, 1, 3, 9, 27, when the constant factor or "common ratio," as it is called, is 3, and 100, 101, $102\frac{1}{100}$, $103\frac{3}{100}\frac{1}{0}$, when the common ratio is $1\frac{1}{100}$, are in geometrical progression. Malthus, who maintained that food could only be increased in an ARITHMETICAL RATIO (*q.v.*), observed that since any number of pairs of human beings can each have as many children as one pair, the population of a country, if it were regulated by procreative power alone, would be multiplied in each successive equal interval of time by a constant factor, or, to put it more shortly, would "increase in a geometrical ratio." The point of Malthus's comparison of the two ratios lies in the fact that if food could only be increased in an arithmetical progression, the addition which could be made to its production in a given period would never grow, while if population increased in a geometrical progression, the addition which would be made to the number of mouths in the same period would constantly be growing. For eighty years after Malthus first wrote, the population of Great

Britain continued to grow in a geometrical progression, the censuses showing that, roughly speaking, it multiplied itself by $1\frac{3}{100}$ every ten years.

[Todhunter's *Algebra*.—Malthus, *Essay on the Principle of Population*, bk. i. ch. i. and elsewhere throughout. Though Malthus was doubtless the first to apply the phrase "arithmetical progression" to the increase of food, he was not, of course, the first to apply the phrase "geometrical progression" to the growth of population. It is *e.g.* suggested by the opening of the article on population in the *Encyclopédie*, and is actually used by Voltaire (*Dictionnaire philosophique* in *Œuvres complètes*, vol. xx., p. 253).] E. C.

GÉRANDO, Joseph Maria, Baron de (1772-1842), was born at Lyons and died at Paris. His life, especially in his youth, was full of dramatic incidents. He was on the eve of taking orders when the massacres of September 1792 deterred him from this step. He retired to Lyons and sided against the Convention when that city was besieged in 1793. Wounded, imprisoned, and condemned to death, he still contrived to escape and to find a refuge in Savoy. He returned to France after the amnesty, and joined the army as a private (*chasseur à cheval*). While he was in garrison at Colmar he competed (in 1799) for a prize offered by the Institute. He gained the prize; and the jury, astonished that a common soldier should have won such a distinction, begged, with success, that he might be transferred to Paris. He rapidly rose to high position; he became secretary-general in the office of the ministry of the interior. In this post he remained eight years; he then became a counsellor of state—a dignity of which the Restoration did not deprive him—and in 1830 a peer of France. In 1819 and 1820 he had given a course of lectures on administrative law. Moral science was the study which he preferred. In 1806 he had been elected to the Academy of moral and political science; and when, in 1832, this section of the Institute, which had been suppressed in 1816, was reconstituted, he was restored to the position in it he had formerly held. We shall pass by his philosophical works, and even those connected with the moral sciences, and shall refer only to the one of them which deals with political economy, that entitled *De la bienfaisance publique*, 4 vols. 8vo, 1839, a powerful book, dealing with a wide range of subjects but somewhat diffuse, the writer having covered too much ground in his work. There was no question that he was competent to deal with these subjects, having administered the Blind Asylum for thirty-five years. He had also taken part in many charitable associations, for savings, mutual help, etc., in which his assistance had been very valuable.

His other works of the same class were: *Tableau des sociétés et des institutions religieuses, charitables et de bien public de Londres*, 1 vol. 12mo, 1824.—*Le visiteur des pauvres*, 1820-1837. Of this there have been several editions, and the work received the *prix Montyon* from the French Academy.—*De l'éducation des sourds-muets de naissance*, 2 vols. 8vo, 1827, and finally *Des progrès de l'industrie dans leur rapport avec le bien-être, physique et moral, de la classe ouvrière*, which received a prize from the *Société industrielle* of Mulhouse, 1841-45, and has gone through several editions. A. C. f.

GERMAN SCHOOL OF POLITICAL ECONOMY. "Political economy in Germany up to the present time has been a foreign science. . . . It was imported from England and France as a ready-made commodity, and the German professors and those who taught it remained no more than scholars." This oft-quoted expression from Karl Marx's *Das Kapital* (vol. i. appendix) is on the whole justified, if applied to the period since Adam Smith, but does not correctly apply to pre-Smithian times, when the economic precepts termed collectively "the cameral sciences" (see Cameralistic Science) formed a distinct doctrine not till later affected by any foreign influence.

The "cameral sciences" (from *camera*, chamber, in particular the chamber in which the revenue and expenditure of the sovereign were administered) had a wider scope than the political, or "national" economy (*Volkswirthschaftslehre*) of the present day. In the narrower sense, as cameral science proper, the study comprised merely the financial administration just mentioned; in its wider sense it embraced not only the doctrines relating to the administrative measures for the public welfare, but also the technical side of production, *e.g.* agriculture, mining, technology, commerce, etc. The immediate object of the cameral sciences was to educate a competent staff of state officials. When absolute government was supplanted by English constitutional ideas the cameral sciences retreated in their turn before political economy as represented by Adam Smith. Survivals of them exist nevertheless in Germany up to the present day. Established as it was by the Golden Bull of 1356, territorial sovereignty in Germany did not attain to full development till after the peace of Westphalia (1648). Hence it was only since this last date that cameral science came forward as an independent body of doctrine. In more ancient times it is treated as a supplement to jurisprudence.

Hence also it results that the history of political economy in Germany falls into three main sections:—I. the period before the end of the Thirty Years' War; II. the interval between the Thirty Years' War and Adam Smith; III. from Adam Smith up to the present day.

I. *The period before the end of the Thirty Years' War* (1648).—Germany during the middle ages presents a state of affairs re-

sembling that of other European countries. It is only among the exponents of CANON LAW that we meet with disquisitions on economic relations. The standpoint corresponds to the theological basis of the main doctrine. Natural economics are more pleasing in the sight of God than economics based on money. The encroachments of the latter are to be opposed by severe usury laws (see INTEREST). Germany has no teacher in this line who overtops his fellows, as, for example, France has in her Bishop ORESME (died 1382).

With the approach of modern times and the victorious advance of monetary economics, a change also took place in theory. The Humanists (see HUMANISM), as adherents of absolute government copied from classic ideals, discussed the means by which that system of government, as opposed to the feudal organisation of society, could be established, putting forward views akin to the mercantilism of a later age (see MERCANTILE SYSTEM). This holds good for the *Institutio principis christiani* of Erasmus, translated under the title of *Unterweisung eines frummen und christlichen Fürsten* (1521), which is the first independent work on these matters. It is dedicated to Charles V. and culminates in the advice that a sovereign should follow a thrifty régime, and, in the event of his needing a tribute, should in the first place levy it on the goods of foreign merchants. There can be no doubt that this work was a material incentive to the scheme brought forward in the imperial diet in the winter of 1522-23 for consolidating the imperial customs. It proposed to encircle the empire, including the Netherlands but excluding Switzerland, with a customs line and a duty of 4 per cent *ad valorem* on imports and exports. The project was defeated through the opposition of the mercantile interest in the imperial towns.

The reformers, especially LUTHER, contribute with more or less discursiveness to the discussion of the economic situation, without, however, showing any marked originality. They hold a kind of middle position between the standpoint of canon law and that of the mercantilism of territorial sovereignty.

A somewhat lively literary controversy, chiefly conducted by jurists, arose towards the middle of the 16th century respecting the currency. The question whether coins should be minted at their full nominal value, or at less than their full nominal value in metal, was the apple of discord in a semi-official paper war, which became celebrated, between the two branches, Ernestian and Albertian, of the princely house of Saxony (1530). The reign of the most remarkable territorial sovereign of his time, the Elector Augustus of Saxony (1553-86), soon after gave occasion for several more important economic works, notably Von OSSA's *Prudentia regnativa* (written 1556, published 1607). More than a century later (1717) it was republished by THOMASIUS and made the basis of his economic lectures.

Special mention under this period may further be made of OBRECHT, professor of law at Strassburg, with his posthumous work (1617) entitled *Fünff unterschiedliche* secreta politica *von Anstellung und Vermehrung guter Policey*, etc., in which he urges the necessity of a fund of money (*ærarium sanctum*) for the sovereign, and proposes to connect with it a system of fire insurance. He also discusses a special institution to provide for children (*ærarium liberorum*) on almost modern insurance principles. The names of the chief originator of the so-called "*Hausvœter* literature" of rural economy — T. Colerus (*Œconomia ruralis et domestica*, 1591-1605), of the jurist T. Bornitz (*De rerum sufficientia in republica et civitate procuranda*, 1625), and of the professor of law at Tübingen and subsequently at Ingolstadt, Chr. BESOLD (*De ærario*, 1620), also deserve mention, the two latter being more or less encyclopædic in treatment. A transition between this and the next period is afforded by K. KLOCK, whose book *De contributionibus* (1634), written during the Thirty Years' War, contains a detailed and rather advanced theory of taxation, in which some attempt is made to construct a progressive system.

II. *The period between the Thirty Years' War and Adam Smith* (1648-1790).—Seldom has it ever befallen a nation to experience an overthrow, both in its internal and external relations, similar to that which Germany sustained between 1618 and 1648. Prosperity was annihilated and the nation lacerated to death. The lead in politics and culture was henceforward, for centuries, surrendered to the western states of Europe. It was no easy task which confronted territorial sovereignty, the principle of which had, since the peace of Westphalia, been made one of the essential parts of the imperial constitution. The land laid waste had to be brought into cultivation again, and, for this purpose, had to be re-populated, and the state debt incurred by the war to be liquidated. Scientific skill was called in to help. The theory of administration or cameral science, which at that period was attaining its full development, thus became on one side a theory of agriculture; on another, a policy of population; on a third, a science of state revenue, or finance. And hence there grew up the composite title under which, from the beginning of the 18th century, these subjects were taught at the universities, viz. "economic, police, and especially cameral science" (*Oekonomische Polizei- und* (besondere) *Cameral-wissenschaft*).

The science split into two "confessions," corresponding to the religious dualism of the empire. There was a Catholic branch, group-

ing itself around the house of the Hapsburgs; and a Protestant branch, the central force of which gradually developed together with the growing ascendency of the Hohenzollerns.

In the Catholic group the sectarian character is less prominent. It starts with J. J. BECHER (*q.v.*), whose brilliant work, *Politischer Discurs von den eigentlichen Ursachen des Auf- und Abnehmens der Reiche, Städte und Republiken*, etc. (1668), might even to-day be read with profit. Dedicated, in the second edition, to the emperor, Leopold I., it maintains that "*die volkreiche und nahrhafte Gemeine*," a populous and well nourished community, should be the aim of territorial administrative policy. Without the means of subsistence there is no population; the converse also holds good that without an adequate population there can be no proper means of subsistence, since human beings are dependent on each other. Hence the statesman has impartially to keep in view both these poles on which the welfare of the state turns. In so doing he must guard against the three cardinal foes of well-being, namely *monopolium* (monopolies); *polypolium* (industrial anarchy); and *propolium* (usurious forestalling). Becher's proposals for preventive organisation border more or less on socialism. He detested merchants who imported from abroad goods that may also be produced at home, and abused them roundly as the real "propolists." On the other hand, men of business who invested their capital in the promotion of native industry seemed to him the "pillars" of society. The whole political system ought to be based on true religion (Catholicism). Nevertheless the clergy has to stand within, and not without, the state, and must be subject to civil law. The development of Becher's ideas is continued by F. W. HORNECK'S *Oesterreich über alles wann es nur will* (1684). One proposition in it has become celebrated, viz. "it were better to give two thalers for a commodity and keep them in the country, than to give only one which leaves the country." Horneck attaches cardinal importance to the industrial independence of his country, and especially with regard to France. To compass this he would prohibit in general all foreign manufactures, and do this without waiting till all the corresponding industries were started in the country, inasmuch as they would at once spring up out of the earth. The third of this group was W. von SCHRÖDER, author of a book dedicated to the Emperor Leopold, *Fürstliche Schatz- und Rent-Kammer* (1686). Here highest importance is ascribed to the financial interest of the ruler, which ultimately coincides with the national interest. The sentence, "that the wealth or the poverty of the country is caused, not by import and export of money, but by the equilibrium of manufacture" (cp. lix.), is characteristic of the writer's standpoint. This being so, Schröder should not be termed, as he is by many, *e.g.* by ROSCHER, a strict mercantilist in the sense of confounding wealth with metallic money. There is in fact no "strict" mercantilist in this sense amongst the German cameralists.[1]

The Protestant section presents a richer, if not exactly a more important, literature. At the head stands V. L. von SECKENDORFF (*q.v.*), whose work *Der teutsche Fürstenstaat* (1655) is written in a strictly Lutheran spirit. The Protestant disposition comes out yet more keenly in the later work *Der Christenstaat* (1685), which seeks to show "what things in church and state are Christian and right, and what can be reformed according to the principles of Christianity" (*i.e.* of Protestantism). Seckendorff had set himself the task of initiating young statesmen into the theory and art of government. His *Fürstenstaat* is, therefore, essentially didactic in character. The leading idea is the coincidence between the interest of sovereign and people, whom he wished to see as numerous as possible. "The greatest treasure of the country consists in numbers of well-nourished people." After he had spent the chief part of his life in the service of the Dukes of Gotha, he was appointed chancellor of the newly-founded university of Halle in the service of the Elector of Brandenburg, but died in the same year (1692). In the reign of the Great Elector of Brandenburg, Frederick William the Great (1640-1688), a violent paper controversy took place concerning the excise. It was opened by the work *Entdeckte Goldgrube in der Accise*, by Chr. Teutophilus (pseudonym for Tenzel), 1685. In it the Great Elector is extolled for keeping on foot a standing army (*miles perpetuus*) for the maintenance of his Protestant supremacy, for which the "sweet-tempered, gently-flowing excise" was a far more fitting fiscal means than the "violent levy." This advice, as we know, was not unheeded by the prince.

Cameral studies underwent an important development during the reign of king Frederick William I. of Prussia (1713-1740). Although

[1] The statement that "wealth is money" I have come across but once in the economic literature of Germany, viz. in the second of the three pamphlets concerned with the currency controversy between the two branches of the ruling house of Saxony mentioned above (1530). (See pp. 66 and 70 of the new edition prepared by W. Lotz, Leipzig, 1893.) This little tract, put together merely for controversial purposes, *Das Münz-Belangende Antwort und Bericht*, etc., is justly stigmatised by Roscher as being "strikingly ill-written" and "sophistical," and can in no case rank as representing a prevailing tendency of thought. It is much more common, in cameralistic literature, to find sentences apparently postulating identity between wealth and population. Yet it would again be incorrect to regard this view as especially characteristic of cameralism. On closer inspection the two notions, wealth and population, are found to be distinct, while they are related as reciprocally cause and effect. The wealth or well-being of the nation consists in the equilibrium, conditioned by progress, of both elements. A. O.

no friend to the university system, he held that in connection with his reorganisation of the Prussian civil service the establishment of cameralistic chairs was necessary. The professorship at Halle university was given to GASSER, till then professor of law, while that at Frankfurt on the Oder was bestowed on Dithmar the historian (1727). From the date of the latter's book, *Einleitung in die Oekonomische Polizei- und Cameralwissenschaft* (1731), the division of subjects indicated by its title remained unchanged till the time of SONNENFELS. Dithmar also was the first to start an economic journal in Germany under the title *Oekonomische Fama* (from 1729).

From this date also specialised treatises began to appear. J. R. von ROHR (1688-1742) set forth "economic" science, *i.e.* the theory of rural economy, in his *Compendiöse Haushaltungsbibliothek*. Through his work *Silvicultura œconomica* (1713), H. C. von Carlowitz became the father of the economics of forestry. P. T. MARPERGER (1656-1730) achieved in his own writings an entire literature of commerce. The theory of population found its classic representative in T. P. SÜSSMILCH (*q.v.*), whose famous work, *Die göttliche Ordnung in den Veränderungen des menschlichen Geschlechts* (1742), which appeared in the reign of Frederick the Great (1740-1786), may be looked upon as the programme of that monarch as regards the politics of population. Süssmilch takes as his text the scriptural injunction, "Be fruitful and multiply." The king considered it as "un axiome certain, que le nombre des peuples fait la richesse des États."

Two side channels, one philosophical and one statistical, now flow parallel to the main stream of the Protestant branch of cameral science.

At the head of the former stands LEIBNITZ, who, in his *Bedenken von Aufrichtung einer Societät in Deutschland zur Aufnahme der Künste und Wissenschaften* (1669), expresses opinions in essential agreement with Becher's economic ideas. G. MORHOF, professor at Kiel, reviving the old Greek division of practical philosophy into ethics, politics, and economics, in his large work, *Polyhistor* (1688 and 1692), treated comprehensively of the literature and history of the last-named subject. Chr. THOMASIUS of Halle, in his popular philosophical lectures, dealt fully with economic matters, taking as his basis the writings of Ossa and Seckendorff. Political economy is specially appreciated by Chr. WOLFF, at first in his *Vernünftige Gedanken vom gesellschaftlichen Leben der Menschen* (1721), and then in his *Œconomica methodo scientifico pertractata* (1754), the standpoint being throughout a moderate mercantilism.

The statistical parallel line takes its origin in the writings of the father of the history of German law, H. CONRING (*q.v.*) of Helmstedt (d. 1681). It is continued by G. SCHMEIZEL (d. 1747), who included in his university lectures at Jena and Halle a *collegium politico-statisticum*, and received further development from his pupil, G. ACHENWALL (*q.v.*, d. 1772) at Göttingen, and gained for him, though inappropriately, the sobriquet of a "father of statistics." He was followed at Göttingen by A. SCHLÖZER, the author of the well-known definition, "Statistics are stationary history, and history is continuous statistics." In contrast to the English "political arithmeticians," such as PETTY, GRAUNT, HALLEY, and others, the chief strength of his method lies not in the figures "Zahlen," but in the description in words "Wortbeschreibung." This "Staatenzustandskunde" (science of the condition of states), in its geographical aspects—is further developed by BÜSCHING (d. 1793).

It was thus that matters stood in Germany when foreign science began to exercise an influence on cameral science, which till then had moved entirely within its own national limits. The movement began in the work of the diplomatist and friend of Frederick the Great, T. F. von Bielfeld — *Institutions politiques* (1760; German edition entitled *Lehrbegriff der Staatskunst*, 1761). This, though destitute of originality, was an epoch-making book for Germany, inasmuch as it dealt with matters entirely outside the range of the cameral sciences of that day, and, as it was written in French, is exclusively based on French economic works. For the first time the German reading public became acquainted with such authors as VAUBAN, MELON, DUTOT, FORBONNAIS, etc. From that time the influence of foreign writings on cameralistic literature became permanent.

The merit of having united into one systematic whole the collected antecedent tendencies of the Catholic and Protestant sections as well as of the later foreign influences, belongs to J. H. G. von JUSTI (d. 1771). Justi had been in the employ both of Austria and of Prussia, as well as for a time in that of Hanover (Göttingen). The earliest of his principal works is *Staatswirthschaft* (1st ed. 1750); his later writings are but more comprehensive expositions of it. Justi follows in general the divisions of Dithmar, but he establishes the science of trade or commerce, as a separate sub-division to be detached from the science of political administration. To Justi can be traced the scheme, which was subsequently carried out in various places, of establishing in the German universities, not only separate chairs, but entire faculties of political economy, with six or seven professors. His saying that a state can never be over-peopled is well known. In political philosophy his model is MONTESQUIEU, with whose preference for the English constitution he is in sympathy. English economic literature, on the other hand, was almost entirely unknown to him. It was reserved for a British citizen, Sir J. STEUART

(*q.v.*), a partisan of the house of Stuart, to introduce a knowledge of it into Germany. He fled to the Continent after the battle of Culloden (1746), and for a time enjoyed the hospitality of the courts of Baden and Wurtemberg. During this period Steuart composed the celebrated *Inquiry*, etc., the English edition appearing in 1767, the German translation (in two versions), 1769. The work made a great stir, but its influence was soon weakened by the intrusion of the doctrines of the French Physiocrats.

The system of the physiocrats could find no soil so favourable as that of Germany. What proved its special attraction in that country was its metaphysical element. At many of the smaller German universities, some of which are now closed, the chair of philosophy was united to that of the cameral sciences. QUESNAY'S theories, professing to form a philosophical system based on economics, were in striking correspondence to this arrangement. Great enthusiasm arose for the *science nouvelle*, which became known chiefly through the *Éphémérides du citoyen*, published from 1767 onwards (see ÉPHÉMÉRIDES).

At the head of its adherents stood A. SCHLETTWEIN (*q.v.*), formerly *Privatdocent* at Jena, and in 1763 taken into the service of the Margrave KARL FRIEDRICH of Baden. Both these men entered on the experiment of introducing the IMPÔT UNIQUE (*q.v.*) into some villages of Baden (see MIRABEAU, V. R., Marquis de). The margrave, moreover, was the author of the celebrated *Abrégé des principes d'économie politique*, which was revised by DU PONT and Quesnay, and appeared in the issue for 1772 of the *Éphémérides du citoyen*. Schlettwein's zeal was equalled by that of the state secretary of Basle, Isaak ISELIN (*q.v.*) whose periodical, *Ephemeriden der Menschheit* was started in 1776 as a pendant to the Parisian organ similarly named. A prominent position among German economists belongs to the professor of military construction at Kassel, J. MAUVILLON (*q.v.*) of French descent. In his *Sammlung von Aufsätzen über Gegenstände aus der Staatskunst, Staatswirthschaft und neuesten Staatengeschichte*, published in 1776, occurs the first use of the terms "physiocrat" and physiocratic system," which were derived from the word "physiocratie," chosen by Du Pont as the title of a collection of essays published by him; Mauvillon challenged any opponents to a public contest. The glove was taken up by more than one, the first to respond being the Kassel professor, C. W. Dohm, in an article which appeared in the *Deutsches Museum* for 1778, entitled *Ueber das physiokratische System*, followed in 1780 by Von PFEIFER'S *Der Anti-physiokrat*, etc. On behalf of the system then appeared K. F. FÜRSTENAU *Versuch einer Apologie des physiokratischen Systems* (1779); E. SPRINGER *Ueber das physiokratische System* (1780); also Mauvillon's own *Physiokratische Briefe an den Herrn Professor Dohm* (1780). A middle position was taken up by G. A. WILL, *Versuch über die Physiokratie, deren Geschichte, Literatur, Inhalt und Werth* (1782). The contest, which was conducted in the most chivalrous manner, had no favourable issue for the system. Its fall was brought about less by the arguments of its opponents than by the rapidly increasing preponderance of the doctrine of Adam Smith.

Specially noteworthy among the opponents of the Physiocrats is J. von SONNENFELS (*q.v.*), professor of financial and political science at Vienna from 1763. He borrowed his arguments from Quesnay's vehement French opponent, FORBONNAIS, and entered the lists more especially against the IMPÔT UNIQUE. The belief in the desirability of the maximum increase of population, which had been, by the teaching of the Physiocrats, thrust more into the background, emerges with renewed energy in Sonnenfels. The measure of the population in a state is set, not by the means of subsistence, but by the opportunities for employment. The increase of the latter is accordingly the duty of the statesman. Sonnenfels distinguished two kinds of balance in trade, the "numerical," or monetary, balance, and "the balance of advantage," *i.e.* the balance of employment. The one can be active while the other is passive. If *e.g.* Austria and Portugal exchange linen to the value of £2,500,000 for diamonds to the value of only £2,000,000, the numerical balance is unfavourable to Austria, but the balance of advantage is favourable. To Sonnenfels also is due a new classification of economic subjects, indicated already in the title of his principal work—*Grundsätze der Polizei, Handlung und Finanz* (Principles of Police, Commerce, and Finance, 1st ed. 1765). The science of police was to detach the branch dealing with the measures for the public welfare, and to confine itself to the doctrines relating to the maintenance of the public safety. The former should be included in the science of commerce, by which arrangement that science is made to embrace approximately the same subjects which in our days are dealt with by political economy. What was hitherto cameral science proper became the science of finance. This is essentially the classification as now used in the German universities.

Towards the end of the 18th century political economy in Germany becomes a chaos first cleared in the 19th century by the victorious advance of the doctrines of Adam Smith. Original thinkers like Justus MÖSER went their own way, but without producing any abiding influence. Others, such as J. BECKMANN of Göttingen (*q.v.*), JUNG-STILLING of Heidelberg (subsequently of Marburg), kept firm to the old cameralistic pattern, setting forth the doctrine in its completeness, *i.e.* inclusive of

technical methods of production, such as the theory of rural economy, forestry, mining, technology, and trade, and for this purpose compiling countless text-books. Others again followed Sonnenfels. The remainder were divided into adherents of the Physiocrats, and adherents of Adam Smith. The teaching of the latter in particular made irresistible progress through its popularisation in the translated treatises of the French writer J. B. Say.

Cameral science, nevertheless, as already stated, has even at the present day not disappeared from Germany. In the south German states the cameralistic career is still a separate career in the state service, and for the preparation of its candidates the universities of Munich and Tübingen have special independent economic faculties; while elsewhere the subjects in question come under the jurisdiction of the faculties of philosophy or jurisprudence. The technological branches moreover are studied at polytechnical academies, as well as at special schools for agriculture, forestry, mining, and commerce. Modern political economy in Germany shows, however, still many traces of its past. Even though the epigonous attempt of Th. Schmalz, professor at Berlin, to infuse new life into cameral science by infusing physiocratic doctrine into it failed (*Encyclopädie der Kameralwissenschaft*, 2nd ed. 1819), yet the manuals of Rau of Heidelberg (d. 1870) stand with one foot in the old cameral science and the other in Adam Smith's doctrine. This also holds good as to Baumstark of Greifswald (d. 1889), who has been called "the last of the cameralists" (*Kameralistische Encyclopädie*, 1835). At the present time, however, during the 19th century, the Smith-Say tendency has prevailed in academic chairs and in the opinion of the public at large, and accordingly Karl Marx's assertion, quoted at the introduction to this article, respecting this period is, upon the whole, correct. During quite recent years political economy in Germany and Austria has taken an independent flight, and has exercised a most powerful influence over modern thought in other countries.

[Julius Kautz, *Die geschichtliche Entwicklung der National-Oekonomik und ihrer Literatur*, Wien, 1860.—Wilhelm Roscher, *Geschichte der National-Oekonomik in Deutschland*, München, 1874.—Gustav Marchet, *Studien über die Entwicklung der Verwaltungslehre in Deutschland von der zweiten Hälfte des 17 bis zum Ende des 18 Jahrhunderts*, München, 1885. Also the other standard works on the history of political economy.] A. O.

III. *The period from Adam Smith* (1790) *to the present day.*—Though the *Wealth of Nations* was translated[1] into German by Johann Friedrich Schiller (not the poet) as soon as it appeared, its influence in Germany and Austria was very inconsiderable till the end of the century. The most enlightened university of the day was that of Göttingen in Hanover; and the *Göttinger Gelehrten Anzeigen* (10th March and 5th April 1777), while it declared the book to be of great value, pronounced against its chief conclusions, especially in regard to economic policy. The statesmen of the time, when they troubled themselves about economic principles at all, inclined to the Physiocrats, till the shock of the French Revolution discredited everything French. But in 1817 Adam Müller, whose bias was against Adam Smith, speaks of him notwithstanding as "the greatest writer of all times in political economy"; and Müller nine years before had written against him in the tone of one who recognises his great and increasing power. Under Adam Smith, he says, "the science of national economy was no longer directed to a speculative examination of the resources of the state, but to a continual increase of the same in practice." In fact the man and the book were in Germany identified with the active pursuit of wealth as an end in itself. The condition of things described in Fichte's *Closed State* (1800), the eager competition for material riches all the world over, is regarded as Smith's ideal and aim. Garve, the popular philosopher, had popularised Adam Smith by presenting the public with a new translation (1794), and the Scottish economist was already creating a school in Germany. He had become to economics what Kant was to philosophy. The Prussian statesmen of the war of liberation were his followers to a great extent in finance. Many professors were with him. Professor Christian Jakob Kraus of Königsberg (1753-1807) carried his devotion even to the copying of literary peculiarities. Professor Georg Sartorius of Göttingen (1766-1828) departed from his master mainly in the matter of economic policy; he insisted on a number of exceptions to the principle of "natural liberty." Professor August Ferdinand Lüder (1760-1819) at first contented himself with discursive illustration of Smith's doctrines from books of travel and statistics, with too little regard to the facts of his own country, but fell by degrees into a scepticism which was as exaggerated as his earlier faith. Hufeland (1760-1817), Lotz (1771-1838), Soden (1754-1831), and Jakob (1759-1827), were little more than intelligent popularisers. As Garve's economics were connected with the philosophy of Wolff, the economics of Jakob were connected with the philosophy of Kant, of which he was an ardent defender. The influence of Fichte and Hegel on the progress of economics was slow to reveal itself.

The melancholy which accompanied the political depression of Germany in the early years of the 19th century, and which is shown

[1] This translation is in 2 vols. Vol. i. 1776; ii. 1778.

not only by Fichte's *Closed State* (1800), but by books like *Der gesunkene Menschenwerth* (anon. 1804), gave place to a manlier spirit after the war of liberation; there is an improved tone even in economics. The text-book of RAU, the Heidelberg professor (1792-1870), showed an activity of mind which was above mere reproduction of English writings, while the said writings, not only of Smith but of his successors, were really better known and better utilised than before. So important was Rau's *Lehrbuch* (1826) that it may be said to have held the field in spite of much criticism till Professor Adolf Wagner in our own time attempted to re-edit it, and then found he must re-write it. The features characteristic of German economics in its early period are not altogether absent in Rau. Economic books were largely written for the practical statesmen of Germany and not for the economic students, or even the statesmen of the world in general. Rau's book is partly written, like the old *kameralistische Lehrbücher*, for working politicians and diplomatists. But it contains also theoretical economics of a wider range; and its criticisms of the past are largely founded on really economic arguments, not as in what is called the "romantic" school largely on appeals to sentiment. At the same time it seems hardly fair to attach the name romantic to the works of men like Adam MÜLLER (1779-1829), when we consider that the romantic school in literature is on the whole in sympathy with the ideas of the French Revolution, and this "romantic school" in economics is in reaction against them.

From the peace of 1815 we may trace three lines of development in German economics, the theoretical, the historical, and the socialistic, though the lines sometimes cross each other. After Rau on the field of theory the work of Von THÜNEN (1780-1850) is most important. In *Der isolirte Staat* (1826) Von Thünen published investigations on the theory of rent substantially at one with the theory of RICARDO, but worked out independently. His conception is not, as the title might suggest, that of an ideal state, but of a theoretical simplification of the conditions of inquiry. The effect is shown, theoretically, of the distance of equally fertile zones of land from the town as their centre, when all outside influences are conceived to be removed. The influence of situation on rent is thus presented in a figure which shows how nearly the abstract method may approach the pictorial. Von Thünen himself attached even more importance to his theory of natural wages, described by him mathematically as the square root of ap where a is the necessaries of life and p the product of capital and labour. Wages are not simply necessaries, but should increase with the product. Von Thünen is sometimes claimed as a socialist, but his attitude was rather that of a landowner, who was very advanced in his social programme, but could not altogether forget his own order.

HERMANN (1795-1868), the Bavarian minister, was in one respect more worthy than even Von Thünen to rank beside the great English and French economists. His *Staatswirthschaftliche Untersuchungen* (1832) cover all branches of purely economic theory, and there is hardly any part of the subject on which he has not left fruitful suggestion. Like Von Thünen, he showed how a practical man could reason abstractly, though it may perhaps be a sign of a practical bent that in his book he devotes most space to production. He makes a clear distinction between matters technical and matters economical. He dwells on "subjective" aspects of goods and wealth that were afterwards brought into prominence by the Austrian school. The distinction of consumer's capital from productive capital, and joint action from collective action, the analysis of the various elements in cost, and of employer's profits, and the relation of cost to price and to value, are very characteristic. The second half of his book is indeed largely a treatise on value, as was said of the *whole* of Ricardo's. There is perhaps no single German economic work that leaves on its readers so deep an impression of strength as Hermann's; and yet it would be hard to say in what particular his work effected a profound change in economic speculation. Until Professor Marshall paid him due recognition, Hermann's name was little known by English economists, BANFIELD being in this respect a notable exception.

Since Hermann, there has no doubt been much theoretical work done in Germany, but it has as a rule taken the shape of monographs, as of MANGOLDT on *Unternehmergewinn*, Schäffle on *Ausschliesende Absatzverhältnisse*, or else it has occurred incidentally in the course of a treatise perhaps headed *Volkswirthschaftslehre*, but containing more of history, statistics, and politics than of abstract reasoning. In Austria, on the contrary, excellent theoretical work of the old type is being done, and it began in a reaction against the German historical school of political economy. Between this historical school and the theoretical we may take men like LIST as occupying a midway position. After NEBENIUS (1784-1857), LIST (1789-1846) has the chief merit of persuading the states, and sections of states, to adopt free trade within their borders and a uniform tariff outwards,—to institute in other words a customs union (ZOLLVEREIN). Baden, and more effectively Prussia, led the way; and between 1828 and 1852 the Zollverein had drawn nearly all the minor states into its fold.

This movement is in many ways to be compared with the English agitation against the

corn laws and for free trade. Yet the Zollverein secured only what England had possessed for some centuries, and the United Kingdom since 1707 and 1800; there was to be free trade within, and a uniformity in the protective duties against the foreigner. List was a powerful advocate of both domestic free trade and protection against the foreigner. He agreed with COBDEN and BRIGHT in desiring that "political economy should descend from the studies of the learned, from the chairs of the professors, from the cabinets of the statesmen, into the counting-houses of the men of business, the offices of public servants, the dwellings of the landowners, the county meetings of the agriculturists, — to become the common property of all educated citizens" (*National-System*). But this must not be the ruling political economy, which deals with the whole world, as if the universal peace had been already established. Till political strife has ceased, it will be needful for political economy to be national and not cosmopolitan. A protective system will develop the "productive powers" of each several nation, and fit it better for the ultimate state of brotherhood and peace and universal free trade. Political economy should be much more the study of these productive forces than, as hitherto, the study of exchange and value. Like A. COMTE, List had his *law of the three stages*, and he made some show of justifying it from history.

List was, however, not a good representative of the rising historical school. The historical school, of which the main position is that all economical doctrine is relative to the particular epochs in which it appears, and has nothing in it permanent or true for all times, was better represented by SCHÖN, HILDEBRAND, Schäffle, ROSCHER, and Knies. Whether it can claim descent from SAVIGNY and the jurists, or only from Gervinus and the historians, is a question which need not be decided here. It is discussed by Prof. C. Menger (*Methode der Socialwissenschaften*, 1883, bk. iv. ch. iii.) (see HISTORICAL SCHOOL).

Since the time of Hermann some of the best work done in Germany, even in theory, has been done by adherents of this school, and this shows the elasticity of their chief principle. Schäffle has written on *Exclusive rights of Sale* (1867), L. von STEIN on finance and administration (1860), Knies on money (1873 *seq.*). Very significant too is the presence in such a book as Roscher's Political Economy of the old economic discussions of capital, wages, profits, rent, and taxation. Even the extreme section treat the theory of the currency and money as comparatively fixed and permanent, and the Malthusian law of population is so treated on the whole by Roscher, RÜMELIN, and Wagner. There are in fact at least three groups, which may be called a right, a left, and a centre. Roscher and Schäffle, belonging to the right, use deduction freely; RÖSLER, HELD, NASSE, less often; Schmoller and Brentano would fain avoid it altogether, though (like Thorold ROGERS in our own country) they are not able to preserve complete consistency. As was said above (article A. COMTE and ENGLISH EARLY ECONOMIC HISTORY), the historical economists are really historians who have studied economics rather than economists *pur sang;* and this appears especially in the left and centre, — in the historical work of Schmoller, Ochenkowsky, and Nasse.

The difficulty of preserving the threefold classification of German economists appears when we come to deal with the SOCIALISTS OF THE CHAIR. Such a prominent writer as Professor Adolf Wagner or Professor Cohn or Professor Rümelin might find a place among either the socialists or the historical economists. The same might be said of LANGE, who has written the best book on John S. MILL yet published, Mill being known in Germany much better by his *Logic* than by his *Political Economy*. Wagner's work, besides his discussions of taxation and finance, owes much of its value to his constant sense of the bearings of law and philosophy on economical questions. He does not go so far as Schäffle and others in claiming that economics itself should be an ethical science; and his recent commendations of Marshall's *Principles* would show that he is not far from the purely theoretical point of view. In fact the division into three schools is logically defective, though practically convenient. It may serve to point out (1) the men, comparatively few in Germany, who have confined themselves mainly to abstract theory; (2) the men who, without entirely abandoning theory, have looked more to concrete economic facts, especially of past ages; and (3) the men who use both history and theory to support a political scheme—the active intervention of the state in economic movements. Instead of being exclusive, the principles of the three classes are tenable together.

SOCIALISM, as representing not only a conflict of doctrine with doctrine in universities and in the book mart, but almost necessarily a struggle with the government of the day, has had a much more exciting history than orthodox and historical economics. Fichte, who was, with reservations, a socialist (see FICHTE), contrived to avoid this political conflict; and his philosophical successors were even farther from danger. But the Hegelians of the left,—MARX, LASSALLE, Engels, more particularly,—took an active part in political agitation on the side of socialism; and their combination of political and intellectual audacity made them a formidable power.

As the school of abstract theory drew inspiration from Adam Smith and his followers,

the socialists were inspired by the writings of OWEN and READ, THOMPSON and GRAY, but not to the same extent. The influence of the French revolution of 1848, and of the corresponding movements in Germany, was probably much greater; and the intellectual armoury of the socialists was furnished very largely by RICARDO, already known to the Germans in BAUMSTARK'S translation (1837).

Karl MARX, in his *Manifest* (1848) and *Lohnarbeit* (1849), maintained the doctrine that wages are, and must be, simply the cost price of living, and—though this is more clearly brought out in the *Kapital* (1867)—that the gains of capital are due to a production by the labourer for which no wages are paid. That wages mean bare necessaries, and value is cost price, are doctrines that may be drawn from Ricardo with a fair appearance of reason. On this foundation Marx raises his doctrine of surplus value: it means that under threat of starvation workmen produce for the employer more than is enough for their maintenance, but this extra-product goes not to them but to him as the master of the situation. Without the imposing apparatus of illustration from English bluebooks with which *Das Kapital* is provided, Marx would not have made so strong an impression on economists. His contemporary, RODBERTUS (1805-75) had the advantage in power of hard reasoning. Like Von Thünen, he talked like Ricardo, with little or no knowledge of the English writer. He had the disadvantage of being averse from much political agitation, and not disinclined to political compromise. On the other hand, his doctrines on the subject of wages, the normal working day, and capital, are so like those of Marx that the question of priority has been often debated. The famous "iron law," so often identified with German socialism, is strictly speaking the formula of neither Marx nor Rodbertus but of LASSALLE, the gifted and scholarly but too rhetorical and impulsive agitator (1825-64). Lassalle organised the German socialists into a formidable political party; and it is he who is to be specially credited with the creation of state socialism (see SOCIALISM), in its modern form. He threw scorn on SCHULZE-DELITSCH, and his attempt to regenerate society by means of co-operation; but only because he desired co-operation to be subsidised and promoted by the state itself.

The "socialists of the chair," who become noticeable, name and thing, especially after the Austro-Prussian war, are described by one of themselves, Professor Nasse, as owing something of their influence as moderate state socialists to the success of the Prussian bureaucracy at a time when it was a political necessity; and traces of the connection are readily to be seen.

The economists of the present generation may perhaps be better classed under six than under three heads. There are (1) the "Epigoni" or successors of the old classical school, including such men as Karl Braun, Treitschke, Max Wirth, as earlier they included PRINCE SMITH and MICHAELIS. They are usually identified with the MANCHESTER SCHOOL of English politicians. They are still of considerable weight in the journals and on the platforms of the country as well as in parliament.

There are (2) the men of what has been called the "theoretical renaissance," among whom Philippovich and the mathematical economists Launhardt, Auspitz, and Lieben are to be reckoned. They are more or less closely associated with the Austrians (see AUSTRIAN SCHOOL). We can hardly count Dühring and other revivers or transplanters of CAREY'S doctrines, among them; but Dietzel, though a keen critic of the Austrians, must have a place.

(3) In the third place we have the historical school with its various groups; and (4) fourth the socialists of the chair, among whom Wagner and Schmoller, and (earlier) Held, are to be included. Schäffle must have a place, though his recent writings against social democracy have accentuated the difference between his very moderate state socialism and socialism pure and simple. Samter, though sometimes reckoned *Katheder-Socialist*, is almost to be reckoned among the socialists pure and simple. The latter (5) have Bebel and Liebknecht for their chief political champions. Even with his pen Bebel is by no means a mean adversary. Engels, though he lived in England, is to be reckoned as of this school, and in many respects the most powerful writer in it, though Kautsky is not far behind him. The description of the organisation of the party, and the history of its various congresses and journals, belong rather to politics than to economics. The repressive law of October 1878, which lasted above ten years, gave socialism the benefit of persecution. The social democrats of Germany polled 1,700,000 votes in 1893, and returned forty-three members to the Reichstag. The insurance laws of 1883 (sickness), 1884 (accidents), and 1889 (old age) showed that the government had determined to outbid their opponents. It is well known too that Bismarck, who was then in power, had not disdained to learn something from Lassalle. (6) The Christian socialists, under Döllinger, Bishop Ketteler of Mainz and Canon Moufang of Mainz, as Roman Catholics, and latterly Todt, Stöcker, and other Protestants, have no claim to independent economic doctrine; but as social reformers they have, like the socialists of the chair, rivalled the social democrats or socialists pure and simple, and they have contributed to socialistic politics the new element of religion.

The chief associations and journals connected more or less with economics may be mentioned briefly. The free traders have their "economic

congress" (*Volkswirthschaftlicher Kongress*) and Economic Society founded in 1858; and they have done much to remove feudal obstructions and keep the extreme protectionists in check. Something more positive was wanted, however; and in 1872 Schmoller convened a meeting at Eisenach, which issued in the institution of the union for social politics (*Verein für Sozial-politik*) (1873). The union may justly claim a share in the making of the insurance laws; and it has from the first acted in avowed rivalry with the social democrats. It meets for discussion once a year, publishes transactions, and is in many ways like the economic section of the British Association with the addition of a directly practical aim. It has included such men as Nasse, Roscher, Held, Knapp, Mithoff, Conrad, Engel the statistician, Brentano, Wagner, Philippovich, Schönberg, and Miaskowski.

The leading economic journals of Germany represent very clearly the state of economics in that country. The *Jahrbücher für National-ökonomie und Statistik* (edited by Conrad, and frequently called "Conrad's *Jahrbücher*") admit chiefly theoretical, statistical, and descriptive articles without respect of schools. The *Jahrbuch für Gesetzgebung* ("Schmoller's *Jahrbuch*") is more closely allied with law and history. The *Vierteljahrsschrift für Volks-wirthschaft und Kulturgeschichte* is the organ of the free traders; the *Archiv für Soziale Gesetzgebung und Statistik* (Berlin), edited by Braun, deals chiefly with social reform, and also the *Sozial-politisches Wochenblatt*, formerly brought out by the same editor. The *Zeitschrift für Sozial-und Wirthschafts-geschichte* (Freiburg), is the organ of the purely historical economists. Some of Professor Oncken's best historical work has appeared there. The *Zeitschrift für die gesammte Staatswissenschaft* (Tübingen) has been edited by Fricker, Schäffle, and Schönberg, and is fairly catholic. The most temperate and valuable of the socialistic periodicals is *Die Neue Zeit* (Stuttgart). Good economical writing is frequently to be found in the *Preussische Jahrbücher* and *Göttingische Gelehrten Anzeigen*, while it occasionally happens, though more seldom than in England or America, that important articles on economic subjects find their way into journals that are printed for the general reader. In Germany, more than elsewhere, the writing of elaborate articles on economical or social topics has come to be regarded as a kind of condition precedent of a government appointment; and the result is a tendency towards over-production of such articles (see BOUNTIES).

The production of books on economical subjects goes on also without ceasing; but as yet economic theory, if not neglected altogether, is treated by most writers very eclectically, and economics may be more truly described as being in a state of transition in Germany than in England or America. This is shown not only by the minute divisions of schools, which recall the political particularism of old Germany, but by the variety of points of view adopted in such a collection of economical treatises as Schönberg's *Handbuch* (1882) or in such a work as the *Handwörterbuch der Staatswissenschaften*, completed 1894 under the editorship of Conrad, Elster, Lexis, and Loening.

It ought to be added that among the valuable monographs published in Germany in the present generation, not a few, like those of Lange, Hasbach, Walcker, and Leser, deal with English economists; and the intercourse between English and German economists was probably never so close as it is now. This is the more welcome as the conditions of life in the two countries are tending to become more and more similar, and the same problems will face the thinkers and legislators in both of them. The influence on economical speculation of the condition of the particular country where it is carried on is always considerable. It is not by accident that the weight of economic opinion in Germany is in favour of Malthus and in France against him. The success, too, or failure of particular social schemes, as co-operative banking, or labour colonies, has helped to influence the views of the learned concerning theoretical possibilities. The same kind of lesson has been taught by the changes in currency. The adoption of a gold standard, after the war of 1870, has led to an active discussion of questions of currency; and the effects that followed the change have made German economists cautious in their theoretical decisions on the subject of the standard. A commission was convened in 1894, but brought no such thorough sifting of opinion in the matter, such as was effected two years before in Austria (1892) by the great currency commission. It remains to be said that the change, so far as it introduced a uniform coinage throughout the German empire, is admitted on all hands to have been a valuable reform.

Science, 1894).—Roscher (Wilhelm), *National-ökonomik in Deutschland* (1874) (an English summary is given by Ingram, *History of Pol. Econ.*, 1888, pp. 184 *seq.*)—Cliffe Leslie, T. E., *Fortnightly Review*, July 1875, a review of Roscher, reprinted in *Essays in Political and Moral Philosophy*, 1879, pp. 167 *seq.*, under the title "The History of German Political Economy."—Contzen (Heinrich), *Geschichte der Literatur und Bedeutung der Nationalökonomie oder Volkswirthschaftslehre*, 1881 (2nd ed.) [somewhat didactic].—Resch (Peter), *Geschichte der*

deutschen Nationalökonomie im 19ten Jahrhunderte (1889) [too meagre].—Eisenhart (Hugo), *Geschichte der Nationalökonomik*, 2nd ed., 1891 [the best general history]. — Nasse (Erwin), *Quarterly Journal of Economics* (Harvard) i. (1886), 498 *seq.*—Cossa (Luigi), *Introduction to the Study of Pol. Econ.* (Eng. transl., 1893), pp. 399 *seq.*—Rae John), *Contemporary Socialism* (2nd ed., 1891) "The Economic Movement in Germany."—Dawson (W. H.), *German Socialism and Ferdinand Lassalle*, a biographical history of German socialistic movements during this century, 1888, and *Germany and the Germans*, 1894.—Schmoller (Gustav), *Zur Litteraturgeschichte der Staats- und Socialwissenschaften* (1888) (On Fichte, List, Carey, Stein, etc., down to Hertzka and Menger).—Hasbach (Wilhelm), *Economic Journal*, i. 509 *seq.* (Sept. 1891), "Recent Contributions to Economic History in Germany."—Philippovich (Eugen), *Quarterly Journal of Economics*, v. pp. 220 *seq.* (January 1891), "The Verein für Sozialpolitik." A good account of the new insurance laws is in the *Forum* for October 1889, by Prof. Taussig: who also gives a good account of the theory of wages as it has developed in Germany since Hermann, *Quarterly Journal of Economics*, Oct. 1894. In the *Edinburgh Review* for Sept. 1828, there is an article by M'Culloch headed "Prussian Political Economy;" but it is a mere review of a French translation of Schmalz's *Political Economy*, and notes the free-trade doctrines of that physiocratic Epigonos, without any general survey of his contemporaries. For other remarks on modern German school, especially on Wagner, see Marshall's, *Principles of Economics*, 3rd ed. vol. i.] J. B.

GERSON, Jean Charlier de (1363-1429), of the village of Gerson near Rheims, the famous chancellor of the university of Paris, contributed in the wide range of his written sermons and tractates to the theological economics of scholasticism. He is especially interesting as one who by his breadth of view and eminent gifts of piety and statesmanship, was drawn in opposite directions when dealing with economic ethics, now upholding the scholastic theories of "divine and natural law" (see Jus Divinum, Humanum, Naturale), now driven to compromise by the teaching of experience; forced to conclude that the former might, because of the hardness of men's hearts, never be so imperative as not to permit the advisableness, and sanction the validity, of some less absolute code of civil rules. Thus in his sermon *De reddendo debito* he approves of the assize of "wine and bread and the like," inasmuch as no amount of sermons, or multiplication of preachers would ever be sufficient to correct the fraudulent and excessive prices demanded by self-perjuring tradesmen. Again Usury is repeatedly and utterly condemned by him as contrary to divine and natural law, essentially bad and not to be made good. Yet he admitted its contingent benefits, approved of a legal (low) rate of usury as likely to check abuse of it, and at the council of Constance, when a sweeping measure to abolish usury was called for, he quashed the motion by demanding that a distinction between a fair and a usurious contract should first be made out.

The *Tractatus de Contractibus, de Venditione, et Emptione* contains essentially his contribution to the analysis of Exchange together with his chief disquisition on usury. In it he describes the various forms of contract, and defines it as a kind of mutual justice and a legitimate exchange of property, not to be condemned because the bargain may incline to the relatively greater advantage now of buyer, now of seller. He discusses also the function of the state in relation to contracts, recognising its right to modify them, but resenting multiplication of statutes and penalties as an intolerable yoke. Against usury he adduces the usual arguments, scriptural and classical. He also endeavours to prove that, since to use money is to consume it, none but the owner of it can use it. Hence the "iniquity of the usurer" in receiving back what has ceased to be his, and more into the bargain, or rather "out of the bargain." And generally it is rather the mutual injustice imputed to lending on interest that moved Gerson. Taking advantage of the credulity of the buyer, or the urgency of his need, is to him usurious business equally with receiving money *ultra sortem* (*i.e.* as interest). And in the "accidental" circumstance of a *commutativa justitia* attending lending at interest he saw grounds for mitigating his condemnation. The loan might avert ruin or crime in the case of the borrower. Hence it might be tolerated, "lest a worse thing befall us." In all cases the decision lay between the "dual tribunal of intrinsic and extrinsic conscience, the one of the church, the other of secular politics."

[Charlier de Gersonii, *Opera*, Parisiis, 1606, esp. vol. ii.—Funk, *Geschichte des kirchlichen Zinsverbotes*, Tübingen (Universitätsschriften), 1876.]

C. A. F.

GHENT, Henry of (1217 ?-93), schoolman, born in that city at the commencement of the 13th century, was the son or descendant of a tailor. He was educated at Tournai, where he was a canon in 1267, and archdeacon in 1278. He was known as "Doctor Solemnis," and besides many theological and metaphysical works, is believed to have written *Quodlibetum de Mercimoniis et Negotiationibus*, of which the only copy in MS. was formerly in the abbey of St. Val Sainte Marie near Valenciennes (Val. Andreæ, *Bibliotheca Belgica*, London, 1643, p. 345). This book is now lost, but Cossa considers that the author appears to have shown in it "a somewhat juster understanding of commerce, its lawfulness and utility, than most of his contemporaries" (Cossa, *Introduction*, etc., 2nd ed. Eng. Translation, p. 147).

[F. Huet, *Recherches sur Henri de Gand*, 1838.—B. Hauréau, *De la Philosophie Scolastique*, t. ii.—*Histoire Littéraire de la France*, t. xxii.,

H. R. T.

GHETTI, Ludovico, was one of the humanist philosophers who flourished in Florence and Tuscany during the 15th century. Ghetti applied himself to finance, and the system of taxation, a problem much discussed at that time in Florence, where very different methods had been tried.

"Savonarola, the Christian reformer, was in favour of the rating of real property; Guicciardini gives a scheme for levying taxes on a sliding or proportionate scale" (Cossa, *Introduction to Pol. Econ.*, translation, p. 156). Ghetti advocated the Impôt Unique (*q.v.*).

[For the history of the influence of the humanists on political economy, see Cossa, *Introduction to Pol. Econ.*, translation, p. 157.—And for fuller detail, Toniolo, E., *Scolastica ed umanismo nelle dottrine economiche al tempo del risorgimento in Toscana*, Pisa, 1887.]

A. B.

GIANNI, Francesco Maria (1728-1821) born at Florence. His works on economics do not mark any progress in science, but his great reputation rests on his sagacious co-operation in the great economic reforms of Leopold II. of Tuscany. In carrying these out, perhaps assisted by a study of the works of Bandini, he advocated free trade in corn. This step, proposed after 1756, led on to complete free trade in grain and food in Tuscany (1767).

In his *Meditazione sulla teoria e sulla pratica delle Imposizioni e Tasse pubbliche*, Gianni considers custom-houses as means to obtain the equilibrium and sometimes a surplus on the balance of international trade; but when he speaks of the grain trade, with a singular contradiction he evinces himself a regular free-trader. Firm in his opinions, after having triumphed in the liberal reforms of 1767, he opposed by several *Memorie* the edict of 1792, which deprived Tuscany of its free government.

He maintains that liberty alone can produce prosperity, and trade needs no restraints to enable it to thrive, as clearly shown in Tuscany during twenty-four years.

Gianni did not write a treatise on this question; even in his *Memorie Speciali*, which deal with the subject, he never discusses theory as Fabroni did, but his arguments are supported by facts, which render them far more convincing.

[Gianni's *Memorie*, his speeches, and other writings are carefully collected in the *Raccolte degli Economisti toscani* (Firenze, 1847-49, 4 vols.) which contain Gianni's and Fabroni's works.]

A. B.

GIBBONS, James Sloan (19th century), was born in Wilmington, Delaware, in 1810. He was a merchant in Philadelphia, and removed to New York in 1835, where he became identified with banking interests. He wrote *Banks of New York, their Dealers, the Clearing House, and the Panic of 1857*, New York, 1859 (reprinted 1870), pp. 399. Gibbons gives in this a detailed and vivid description of the administration of banks, and discusses the causes of the panic of 1857, attributing it to the expansion of bank credit. He also wrote *The public Debt of the United States: its Organisation; its Liquidation; Administration of the Treasury; the Financial System*, New York, 1867, pp. xii. 276, in which he condemns the loose administration of the national finances, and the heavy taxes upon labour.

D. R. D.

GIFT in its modern sense means a voluntary transfer of property. According to Roman law an agreement to make a gift may be a valid contract, but English law does not enforce promises of that nature unless made by deed under seal. On the other hand English law does not restrict the power to deal with property by way of gift, while Roman law and some modern systems of law contain such restrictions. According to French law a person leaving on his decease one child or other descendant may not dispose of more than one-half of his property by way of gift, and if he leaves two children or other descendants his gifts may not exceed one-third (if three or more, one-fourth) of his property (*Code Civil*, art. 913). An English donor need not consider the claims of his family, but the law to a certain extent protects his creditors, inasmuch as it allows gifts to be set aside in certain cases, either by virtue of the provisions of the Bankruptcy Act or under one of the statutes of Elizabeth against voluntary conveyances (see Legislation, Elizabethan; Donatio Mortis Causa).

E. S.

GIGINTA, Miguel de (16th century), a canon of Elna in Roussillon, and author of several works on the treatment of the poor: *Tratado de Remedio de Pobres* (A Treatise on the Remedy for Poverty), Coïmbra, 1579; *Exhortacion á la Compasion de los Pobres*, Madrid, and Saragossa, 1584; *Cadena de Oro del Remedio de los Pobres* (A Golden Chain of the Remedy, etc.), Perpignan, 1584; and *Atalaya de Caridad* (A Watchtower of Charity), Saragossa, 1587. In a *Memorial* approved by the cortes of Madrid in 1586, and inserted by Don Firmin Iglesias in his *Beneficencia en España* (Madrid, 1876, vol. ii. p. 1169, Appendix ix.), Giginta insists upon the necessity of establishing *Casas de Misericordia* (Houses of Mercy) to be kept distinct from hospitals for the sick. The test of labour was to be applied under penalty of a diminution in the allowance of food. As the stubborn poor will thus be impelled to leave the house, the author hopes that charitable persons will deny all help to such vagrants, and reserve their alms for the well-conducted poor duly appointed by the house to collect alms at the gates of churches, or market-places, etc. The houses of mercy were thus to be supported by pious donations and foundations. The cortes

petitioned King Philip in favour of this scheme, but with scanty success.

GILBART, James William (1794-1863), was of Cornish descent, though born in London. He was at first in a London bank, until it stopped payment in 1825; in 1827 he went as manager, first to the Kilkenny, and afterwards to the Waterford branch of the Provincial Bank of Ireland. On the formation of the London and Westminster Bank in 1834, Gilbart became its manager. He did much to secure the successful establishment of joint-stock banks. In 1836 the Bank of England procured an injunction against his bank "prohibiting their accepting any bills drawn at less than six months after date." Gilbart evaded the difficulty by inducing the country banks corresponding with the London and Westminster to draw bills upon it "without acceptance." Gilbart also gave evidence before various parliamentary committees, and secured the insertion of a clause in the renewal of the Bank Charter Act in 1844, granting to joint-stock banks the power "to sue and be sued by their public officers," and also the right of accepting bills at less than six months' date. He became F.R.S. in 1846. Much of his leisure was devoted to the promotion of literary and scientific institutions among the middle and working classes. He was the author of several useful works on banking—the principal treatises being devoted to familiarising the public with the methods and advantages of banks. He also wrote on logic. He bequeathed a sum of £1250 to King's College as an endowment for an annual course of lectures on banking. The *Gilbart Lectures* were commenced in 1872, and are continued to the present time.

Gilbart's works, besides some essays, are (the dates applying in all cases to the first edition):

A Practical Treatise on Banking, 1827.—*History and Principles of Banking*, 1834.—*History of Banking in Ireland*, 1836.—*History of Banking in America*, 1837.—*An Inquiry into the Causes of the Pressure on the Money Market in 1839*, 1840.—*The London Bankers*, 1845.—*Lectures on the History and Principles of Ancient Commerce*, 1847.—*Logic for the Million*, 1851.—*Elements of Banking*, 1852.—*The Laws of the Currency*, 1855.—*The Moral and Religious Duties of Public Companies*, 1856.—*Logic of Banking*, 1859.—*Social Effects of the Reformation*, 1860. An edition of Gilbart's works was issued after his death, London, 6 vols. 1865, but it does not include all the above-mentioned works.

[*Dictionary of National Biography*; Biographical Notice prefixed to the collection of Gilbart's works, 1865.] R. H. H.

GILBERT, Thomas (1720-98), son of Thomas Gilbert of Cotton, Staffordshire; barrister in 1744; land agent to Lord Gower, M.P. for Newcastle-under-Lyne, 1763-68; and Lichfield, 1768-95, wrote on Poor Law Reform; promoter of Gilbert's Act (*q.v.*).

GILBERT'S ACT. The act 22 Geo. III. c. 83, for the better relief and employment of the poor, was commonly known as Gilbert's Act, from the name of its proposer, who represented Lichfield in parliament. The preamble states that the sufferings and distress of the poor are great from two causes, viz. (1) the incapacity of overseers, who misapply funds and favour litigation; (2) the want of proper regulation and management of workhouses. To remedy these evils it makes the following changes in the law. The provisions of 9 Geo. I., which had allowed of the union of small parishes for certain purposes, are extended. Parishes, not more than ten miles apart may combine together, when two-thirds of the ratepayers assessed at £5 and upwards desire it, may build a common workhouse, and borrow money on joint credit. In all such cases, the churchwardens and overseers are released from the duty (imposed by 14 Car. II. c. 12) of relieving the poor, but continue to be responsible for the collection of the rate. The relief of the poor is entrusted to three persons nominated by the justices of the peace, viz. the guardian, who represents his parish at the monthly board, and may be paid up to £10 yearly; the governor, who is charged with the management and discipline of the workhouse; the visitor, who inspects the workhouse, checks accounts, and is generally charged with supervision. In all parishes, whether incorporated or not, the workhouse is to be used only for the aged, sick, and infirm. Able-bodied labourers are to be found work, and the wages they earn to go towards their maintenance. In any case in which the guardians refuse relief, an appeal may lie to the justices.

The act was repealed by the act 34 & 35 Vict. c. 116. It was avowedly an experiment, and contained the germs of much good and much evil. Under the former head we may put (1) the enlargement of the area of administration, a principle made general in 1834; (2) the attempt to improve the status of administrators; (3) the permission to board out children. Under the second (1) the large powers given to the justices, which were soon abused; (2) the granting of relief in aid of wages, which developed into the allowance system (see Allowance System); (3) the practical abolition of the workhouse-test imposed by 9 Geo. I.

In 1834, when the Poor Law was remodelled, there were 67 incorporations under this act containing 924 parishes; in 1853, 14 containing 203; all have now disappeared.

GILDS.

Early History, p. 209; Religious Gilds, p. 210; The Gild Merchant, p. 210; Craft Gilds, p. 211; Gilds of Newcastle-upon-Tyne, p. 213; Gild System in Spain, p. 213.

Early History.—Mediæval gilds were voluntary associations established for mutual assistance. Various theories have been advanced concerning their origin. Some writers, especially Coote and Lambert, regard them as a continuation of the Roman *collegia* and *sodalitates*. There are certainly striking analogies between Roman and Germanic fraternities, but there is little evidence to prove their unbroken continuity of existence.

A more prevalent theory derives gilds wholly or in part from the early Germanic or Scandinavian sacrificial banquets, or drinking bouts. Brentano, Hegel, Wilda, and others, ascribe considerable influence to this heathen element. Sacrifice and banquet are indeed two of the earliest meanings of gild; but when a word has a variety of meanings, and may therefore refer to different things, those things have not necessarily an historical connection. It matters little whether the earliest signification of gild is sacrifice, expiation, penalty, feast, or payment; the solution of the question of verbal derivation does not necessarily affect the origin of gild in the sense of fraternity or society. The heathen sacrificial carousals lack two of the most essential elements of the later institution, namely, corporative solidarity, or permanent association, and the spirit of fraternal co-operation or Christian brotherhood. This last conception included a mixture of worldly and religious ideals—the support of the body and the salvation of the soul.

Another theory has recently been advanced by Dr. Pappenheim. He ascribes the origin of Germanic gilds to the northern "foster-brotherhood," or "sworn-brotherhood,"—an artificial bond of union generally between two persons, sometimes between more than two. After the performance of peculiar ceremonies, such as the intermingling of their blood in the earth, the contracting parties grasped hands, and each took the oath of brotherhood, swearing to avenge any injury done to the other. We cannot here state all the objections to this view (see Hegel, *Städte*, i. 250-253). It will suffice to say that the foster-brotherhood seems to have been unknown to the Franks and the Anglo-Saxons, the nations in which mediæval gilds first appear; and hence Dr. Pappenheim's conclusions, if tenable at all, apply only to Denmark or Scandinavia.

No theory on this subject can be satisfactory which wholly ignores the influence of the Christian church. Imbued with the idea of the brotherhood of man, the church naturally fostered the early growth of gilds, and tried to make them displace or absorb the old heathen banquets. While conceding the influence of Christianity upon the early development of gilds, we must not, however, ascribe their origin to this source. The work of the church was directive rather than creative. Gilds were a natural growth of civilisation, a natural manifestation of the associative spirit which is inherent in mankind. The same needs produce similar associations in different ages. While all such associations have striking resemblances, those of each age have peculiarities which indicate a spontaneous growth. It is not necessary to seek the germ of gilds in any antecedent age or institution. When the old kin-bond—the *maegth* or *sippe*—was dissolving, and the state was still undeveloped, individuals naturally united for mutual help.

The earliest references to gilds are found in the Carolingian capitularies of 779 and 789, and in the enactments made by the synod of Nantes, early in the 9th century, which last are repeated in the ecclesiastical ordinances of Hincmar of Rheims (A.D. 852). There are also vague references to sworn associations of some sort in the capitularies of 805 and 821. The Carolingians, like the Roman emperors, seem to have regarded such unions as dangerous to the state. The gilds of Norway, Denmark, and Sweden are first mentioned in the 11th, 12th, and 13th centuries respectively; those of France and the Netherlands in the 11th. In England they are not clearly referred to before the second half of the 9th century, though many writers believe that they were already in existence in the reign of Ine. We have little information concerning Anglo-Saxon gilds before the 11th century. To the first half of that century belong the statutes of the fraternities of Cambridge, Abbotsbury, and Exeter—the oldest gild ordinances of Europe. The object of the thanes' gild at Cambridge was to provide for the payment of the *wergeld*, in case a member killed any one, and to afford help in blood-feuds. In Orcy's gild at Abbotsbury, and in the brotherhood at Exeter, the religious element is more prominent, the chief object of the brethren's solicitude being the salvation of their souls. The fraternity at Exeter also extended assistance in case of conflagration. Feasting, prayers for the dead, attendance at funerals of members, the solemn entrance oath, fines for neglect of duty and for unseemly behaviour, contributions to a common purse, mutual assistance in distress, the gild-hall, periodical meetings—in short, all the characteristic features of later gilds already appear in the statutes of the Anglo-Saxon fraternities. Continental historians have made conjectural data concerning Anglo-Saxon gilds the basis of important deductions regarding the origin of municipal government throughout western Europe. Hence it is important clearly to sum up all that is known concerning this whole subject. The following three pro-

positions seem incontrovertible. (1) In the second half of the Anglo-Saxon period the gild is a well-known institution, but its prevalence has been greatly exaggerated. (2) There is no evidence to show that there was any organic or official connection between gilds and municipal government, much less that the latter emanated from the former. (3) There is no trace of the existence of either craft or merchant gilds before the Norman Conquest. Commerce and industry were not yet sufficiently developed to call for the creation of such associations.

It is difficult to classify gilds. We have already indicated the three chief classes: religious or benevolent, merchant, and craft or artisan gilds. Those thus far specifically mentioned belong to the first category. The last two categories, which do not become prominent anywhere in Europe until the 12th century, had, like all gilds, a religious tinge, but their aims were primarily worldly. They are, furthermore, distinguished from religious fraternities by being generally confined to a particular occupation or class of persons. We must now examine the later history of religious gilds, and then pass to the other two categories.

Religious Gilds.—After the Norman Conquest religious gilds multiplied in England. They were particularly numerous in the boroughs. Their ordinances and customs were similar to those of the above-mentioned Anglo-Saxon fraternities. The brethren were aided in old age, sickness, and poverty, often also in cases of loss by robbery, shipwreck, and conflagration,—for example, the gild of St. Katherine, Aldersgate, assisted any member if he "falle in poverte, or be aneantised thorwz (through) elde or thorw fyr oder water, theves or syknesse." Alms were often given even to non-gildsmen; lights were supported at certain altars; feasts and processions were held periodically; attendance at funerals of brethren, and at masses for the dead, was required. Some such functions appear in the ordinances of all kinds of gilds, but they are especially prominent in those of the religious brotherhoods. Some of these fraternities came to be closely connected with the municipal government; but, as a rule, they were simply private societies with a limited sphere of activity. They played an important rôle in the social life of England, especially as eleemosynary institutions, down to the time of their suppression in 1547. Religious gilds also flourished on the continent throughout the middle ages, and closely resembled those of England.

The Gild Merchant.—Students of political science are particularly interested in merchant and craft fraternities. The gild merchant came into existence in England soon after the Norman Conquest, as a result of the increasing importance of trade. Whether it was of indigenous growth or a transplantation from Normandy, it is difficult to determine. Until clear evidence of foreign influence is forthcoming, it may be safer to regard it simply as a new application of the old gild principle. But this new application may have been stimulated by continental example. The evidence seems to indicate the pre-existence of the gild merchant in Normandy, though it is not mentioned anywhere on the continent before the 11th century. It spread rapidly in England, being regarded by the townsmen as one of their most important chartered privileges; in the reign of John it was a well-known institution common to many English boroughs. But in some prominent towns it did not exist, notable examples of its absence are found in London, Colchester, Norwich, and the Cinque Ports. The smaller the town in which it existed the more conspicuous was the rôle it played. Its chief function was to regulate the trade monopoly conveyed to the borough by the royal grant of *gilda mercatoria.* The gildsman had the right to trade freely in the town, and to impose payments and restrictions upon others who desired to exercise that privilege. The ordinances of the fraternity thus aim to protect the brethren from the commercial competition of strangers or non-gildsmen. More freedom of trade was allowed at all times in the selling of goods by wholesale; and also in retail dealings during the time of markets and fairs. The ordinances were enforced by an alderman with the assistance of two or more deputies, or by one or two masters, wardens, or keepers. At the *morwenspeches*, or periodical meetings of the society, there was feasting and merry-making, new ordinances were made, members admitted, officers elected, and other business transacted.

Many writers assert that the gild merchant and the borough were identical, and that the former was the basis of the whole municipal constitution. But the records in the local archives show clearly that gild and borough, gildsmen and burgesses, were originally distinct conceptions; and they continued to be discriminated in most towns throughout the middle ages. Admission to the society was not restricted to burgesses; nor did the brethren form an aristocratic body controlling the whole municipal government. No good evidence has, moreover, been advanced to prove that this or any other kind of gild was the germ of the burghal constitution. On the other hand, the gild merchant was certainly an official organ or department of the borough administration; and its influence upon the economic and corporative growth of English municipalities was considerable.

The early relations of the craftsmen and their fraternities to the gild merchant are not clearly indicated in the meagre sources at our disposal. Many artisans seem to have been

admitted to the mercantile fraternity. They bought raw material and sold the manufactured commodity; hence they were regarded as merchants; no sharp line of demarcation was drawn between the two classes in the 12th and 13th centuries. Separate societies of craftsmen were formed in England soon after the gild merchant; but at first they were few in number and of much less importance than the general mercantile fraternity. The origin of the former is not to be attributed to the latter; there was seemingly no organic connection between the two classes of gilds, though many artisans probably belonged both to their own craft fraternity and to the gild merchant, and the latter, owing to its great power in the town, seems to have exercised some sort of supervision over the craftsmen and their societies. When any single body of artisans, such as the weavers or tanners, received from the king the right to have a gild, they secured the monopoly of working and trading in their branch of industry. Thus, with every creation of a craft fraternity the gild merchant was weakened, and its sphere of activity was diminished, though the new bodies were subsidiary to the older and larger fraternity. The greater the commercial and industrial prosperity of a town, the more rapidly did this process of subdivision into craft gilds proceed, keeping pace with the increased division of labour. In the smaller towns, in which agriculture continued a prominent element, few or no craft gilds were formed; and hence the old gild merchant remained longest intact and powerful in that class of boroughs. The period of the three Edwards constitutes an important epoch in the history of industry and gilds. With the rapid development and specialisation of industry, particularly under Edward III., craft fraternities multiplied and grew in power, many master craftsmen became wealthy employers of labour, dealing extensively in the wares which they produced. The class of dealers or merchants, as distinguished from trading artisans, also greatly increased, and established separate fraternities. When these various unions of dealers and of craftsmen embraced all the trades and branches of production in the town, little or no vitality remained in the old gild merchant; it was deprived of its independent sphere of activity. In short, the function of guarding and supervising the trade monopoly had become split up into various fragments, the aggregate of the crafts superseding the old gild merchant. A natural process of elimination, the absorption of its powers by other bodies, had rendered the old organisation superfluous. This transference of authority from the ancient general gild merchant to a number of distinct bodies, and the consequent disintegration and decay of the former, was a gradual spontaneous movement, which, generally speaking, may be assigned to the 14th and 15th centuries, the very period in which the craft gilds attained the zenith of their power. As the present writer's views on this subject appear to have been misinterpreted, it may be well to add that the gild merchant did not give birth to craft fraternities or have anything to do with their origin; nor did it delegate its authority to them. The development was one of slow displacement, or natural growth and decay, due to the play of economic forces.

The history of the English gild merchant is mainly of antiquarian interest. In some places it long survived either as a religious fraternity, shorn of its old functions, or as a periodical feast, or as a vague term applied to the whole municipal corporation. In most towns the name and organisation disappeared toward the close of the middle ages, and the institution was represented by the aggregate of the crafts.

The mediæval gild merchant played a less important rôle on the continent than in England. On the continent it occupies a less prominent place in the town charters and in the municipal polity, and generally corresponds to the later fraternities of English dealers, established either for foreign commerce or to regulate a particular part of the local trade monopoly. Its place in the civic government was in such cases similar to that of many later craft associations.

Craft Gilds.—The bond of union in a craft gild was at first that of common occupation; a craft fraternity comprised all the artisans in a single branch of industry in a particular town. In the 15th and 16th centuries "mistery" and "company" were the most common names for craft societies, though the old term "gild" continued to be used. Craft gilds first appear in England and on the continent early in the 12th century. Their origin was similar to that of the gild merchant; it was occasioned by the expansion of trade and industry, which increased the number of artisans. In banding together for mutual protection they simply followed a natural tendency of the age. It is not necessary to elaborate any more profound theory regarding the origin of these societies. As the trade of England continued to expand in the 13th century their number increased. In the 14th they were fully developed and in a flourishing condition; by that time each branch of industry in every large town had its gild.

The members elected officers who were most commonly called wardens. The chief function of the latter was to supervise the quality of the wares produced, so as to secure honest and excellent workmanship. Hence the hours of labour and the terms of admission to the society, including apprenticeship, were regulated. Members were also expected to make periodical payments to a common fund, and to participate in certain common religious observances, festivities,

and pageants. But the regulation of industry was always paramount to social and religious aims; the chief object of the fraternity was to supervise the processes of manufacture and the monopoly of working and dealing in a particular branch of industry. The organisation and the aims of the craft societies of the continent were similar to those of England.

There was at no time a general struggle in England between the gild merchant and the craft gilds, though in a few towns there may have been some friction between merchants and artisans. There was no conflict in England like that between these two classes in Scotland in the 16th century. Nor is there any close parallel in England to the great continental revolution of the 13th and 14th centuries, by which the crafts threw off the yoke of patrician government and secured more independence in the management of their own affairs and some participation in the civic administration—in certain cases even a monopoly of the latter, the civic constitution being remodelled with the craft fraternities as a basis. Such a conflict was easily avoided in a country where royalty was potent enough to suppress local dissensions and to exact obedience from the towns, and where borough government was mainly democratic until the 15th century. True, there were popular uprisings in England; but they were generally class conflicts between the poor and the rich, the crafts as such seldom taking part in these tumults. While many continental municipalities were drifting from an aristocratic to a more democratic *régime* in the 14th century, those of England were drifting in the reverse direction, toward oligarchy, toward government by a close "select body." As a rule the craft gilds obtained no paramount influence in the boroughs of England, but continued to be subordinate to the town government. Whatever power they did secure, whether as potent subsidiary organs of the municipal polity for the regulation of trade, or as the chief or sole medium for the acquisition of citizenship, or as integral parts of the common council, was, generally speaking, the logical sequence of a gradual economic development, and not the outgrowth of a revolutionary movement by which oppressed craftsmen endeavoured to throw off the yoke of an arrogant patrician gild merchant.

With the expansion of commerce and industry in the 14th century, though the organisation of most crafts was not greatly changed, two new kinds of fraternities appeared, and in the 15th century they became more prominent, namely, the merchants' and the journeymen's companies. The misteries or companies of merchants traded in one or more kinds of wares. They were pre-eminently dealers, who sold what others produced. They are not, however, to be confused with the old gild merchant, which originally comprised both merchants and artisans, and had the whole monopoly of trade in the town. The company of merchants was, in most cases, simply one of the many craft unions, or misteries, which superseded the gild merchant.

The appearance of journeymen, or yeomen, fraternities marks a differentiation or cleft within the ranks of some particular class of artisans, a conflict or divergence of interests between employers, or master artisans, and workmen,—an organised struggle which foreshadows modern strikes. The journeymen combined to protect their special interests—rates of wages, etc. But in most cases the new English fraternities, after struggling a while for complete independence, seem to have become subsidiary and affiliated organs of the older craft gilds. The movement assumed large proportions on the continent, and probably was wide-spread in England, though the published sources give us little information concerning the subject.

One more phenomenon in connection with the organisation of crafts is of considerable interest, namely, their tendency to amalgamate, which is occasionally visible in the 15th century, and still more frequently in the 16th and 17th. Several fraternities—old gilds or new companies—with their respective cognate or heterogeneous branches of industry and trade, were fused into one body. In some towns all the crafts were thus consolidated into a single fraternity; in this case a body was reproduced which regulated the whole trade monopoly of the borough, and hence bore some resemblance to the old gild merchant. It is interesting to observe that already in the 14th century a similar tendency toward the union of crafts is visible in some continental cities, notably in the Netherlands and in Westphalia.

A notable feature in the history of gilds during the Tudor period was the policy of the crown to bring them under public or national control. Laws were passed, for example in 1503, requiring new ordinances of crafts to be approved by the justices of assizes; and the authority of the companies to fix the prices of wares was thus restricted. The statute of 5 Elizabeth, c. 4, also curtailed their jurisdiction over journeymen and apprentices.

The statute of 1547 (1 Edward VI.) did not suppress the craft fraternities. They were expressly excepted from its general operation. Such portions of their revenues as were devoted to definite religious observances were, however, appropriated by the crown. The revenues confiscated were those used for "the finding, maintenance, or sustentation of any priest or of any anniversary, or obit, lamp, light, or other such things." Professor Ashley aptly calls this "the disendowment of the religion of the misteries." Thus Edward VI.'s statute marks no break of continuity in the life of the com-

panies or craft fraternities. But signs of decay had already begun to appear even before the Reformation, and these multiplied in the 16th and 17th centuries. The old gild organisation was breaking down under the action of new economic forces; its dissolution was due especially to the appearance of new industries, organised on a more modern basis, and to the extension of the domestic system of manufacture. The companies gradually lost control over the regulation of industry, though they still retained their old monopoly in the 17th century, and in many cases even in the 18th. The mediæval form of association was incompatible with the new ideas of individual liberty and free competition, with the separation of capital and industry, employers and workmen, and with the introduction of the factory system and mechanical improvements.

In the second half of the 18th century many craft fraternities still survived, but their usefulness had disappeared. Oblivious of their duties to the community, and intent only on self-interest, they had become an unmitigated evil. "They were," as Dr. Held aptly remarks, "ruins which hindered the building of new edifices; the old stones could not even be used in the new structures." There seems to be no evidence of lineal descent or organic connection between them and trades unions. The privileges of the old fraternities were not formally abolished until 1835; and the substantial remains or spectral forms of some are still visible in other towns besides London.

GILDS OF NEWCASTLE-UPON-TYNE. At Newcastle the ancient gilds have survived probably more distinctly than in most other cities of England. Three of the most important of them, the Merchant Adventurers, the Hoastmen, and the Masters and Mariners, have a corporate existence under royal charters. The Merchant Adventurers claim to represent the merchant gild granted to Newcastle by King John in 1215. They received their charter of incorporation in 1546 from Edward VI. under the name of the Merchant Adventurers of Newcastle-upon-Tyne, and the benefit of the charter is confined in express terms to merchants inhabiting Newcastle-upon-Tyne, who then belonged to the Society of Merchant Venturers in the parts of Brabant beyond the seas—a title by which the London Company of the Merchant Adventurers of England, who had branches at Newcastle, Yarmouth, and other maritime towns, were then known. Both before and after receiving the charter, they controlled, as a merchant gild, the foreign and domestic trade of the town. They were subdivided into three distinct fellowships: the drapers or merchants of woollen cloth, the mercers or merchants of silk, and the boothmen or merchants of corn. The Hoastmen, a gild for loading and disposing of coal and stones, were incorporated 1600 by Queen Elizabeth. The Masters and Mariners were incorporated 1536 by King Henry VIII.

Of the other existing gilds, about twenty-nine in number, two or three claim a corporate existence under early charters from the crown, but most of them are unincorporated fraternities constituted by ordinances granted to them by the borough corporation of Newcastle-upon-Tyne. In most of the companies the members no longer follow the trades or occupations designated, and in none of them do the companies exercise any control or influence over these trades or crafts; they principally exist to administer the property they have inherited or acquired. The stewards of the companies are the statutory representatives of the freemen of Newcastle, in whom the exclusive right of grazing the town moor, locally called the "eatage," is still vested.

[Some information as to these gilds may be found in Walker and Richardson's *Armorial Bearings of the Incorporated Companies of Newcastle-upon-Tyne*, 1824.—Brand's *History of Newcastle*, 1789.—Brown's *Short Account of the Customs and Franchises of the Freemen of Newcastle*, 1823.—Gibson's *Newcastle-upon-Tyne Improvement Acts*, 1881, and in *Extracts from the Records of the Merchant Adventurers of Newcastle-upon-Tyne*, published by the Surtees Society in 1895.—Mackenzie's *History of Newcastle*, 1827.—Walford on *Gilds*, 1888, which contains a chapter on Newcastle gilds.]

GILD SYSTEM IN SPAIN. GREMIOS or CRAFT-GILDS arose in Spain during the middle ages under the influence of the same causes as in the rest of Europe. Each separate kingdom of the Spanish monarchy had its own separate laws on the subject, but in all it was strictly kept in hand by the royal prerogative. In Barcelona alone, the *gremios* were exclusively

subordinate to the municipal authorities, even in matter of statutes and legislation, and the royal judges had no jurisdiction over them.

The first opposition against the exclusiveness of the *gremios* arose in Aragon towards the end of the 17th century, but the general opinion remained favourable to their existence for a century more, notwithstanding the striking abuses to which they had given rise. Thus in 1763 the five *Gremios Mayores* of Madrid (silk-weavers, clothiers, hosiers, grocers, and jewellers) succeeded in farming the royal revenue and in founding a privileged company, trading with its own vessels and owning factories in different parts of Spain. The *Gremios* preserved a legal standing up to 1834, although in 1775 CAMPOMANES (*q.v.*) had already proposed their reform in his *Discurso sobre la Educacion Popular*, and, ten years later, JOVELLANOS (*q.v.*) advocated their suppression in his report on the liberty of industry (*Informe sobre la libertad de las Artes*) submitted to the general council of commerce.

[Colmeiro, *Historia de la Economía Política en España*, vol. ii. pp. 237-251. For the regulations of the *Gremios Mayores* see LARRUGA, *Memorias Políticas* (1787), vol. i. pp. 105-169 and 283-314.]

E. Ca.

GIOGALLI, SIMONE (17th century), though not an economist, holds a distinguished place in the history of economic doctrine in Italy. He was a clever Venetian merchant, highly esteemed for a memoir presented to the board of enquiry for trade of the Venetian republic.

When consulted as to the causes of the falling away of the trade of Venice, once so prosperous, and the remedies for this, Giogalli presented the paper mentioned above (*Scrittura inedita di Simone Giogalli, negoziante veneto del sec. xvii.* Venezia, 1856), containing principles of economic liberty.

Giogalli's ideas certainly do not go beyond the narrow boundaries of his republic, but his aim was to foster the commerce of Venice through liberty, in order to establish competition with other markets. However far this was from an international free trade, it is remarkable considering that monoply, privileges, and heavy taxes were then the basis of national economic government.

A. B.

GIOJA, MELCHIORRE (1767-1829), born at Piacenza, died at Milan, studied first theology, then mathematics, economics, and statistics, to which last he applied himself steadily. The political vicissitudes towards the end of the last and the beginning of the present century involved his life: he was imprisoned several times, held and lost various positions, including that of director of the statistical office at Milan under the French; and on returning to that city after a short exile his writings were his sole means of support.

Gioja's works are on public economy, statistics, morals, education, and logic. "He could work hard, and his knowledge was extensive. Analysis was his strong point, but not criticism, where he showed himself captious and unbridled. Not a few of Gioja's observations are equally subtle and original, particularly in his theory of the association of labour of various kinds; but once get him with one of his tabulated statements in hand, and he is the very genius of pedantry" (Cossa, *Introduction to Pol. Econ.*, translation, p. 488). Gioja's greatest work, *Nuovo prospetto delle scienze economiche* (serie i. "Teoria." Milano, 1815-17, vols. i.-iv.) sums up what had been written on *economics, finance, and administration*: he opposed the price fixed for bread by authority (*calmieri*), and favoured large properties; he preferred the arts to agriculture, great manufactures to small ones, great merchants to small merchants, and large towns to small ones.

But while Gioja partly adopted the teaching of the English economists, he contributed to hinder the progress of economic science by a narrow harsh system of protection and government interference, in support of which he wrote *Discorso popolare sulle manifatture nazionali e tariffe daziarie dei commestibili ed il caro prezzo del vitto*, Milano, 1802.

Still he deserves praise for his acute observations on the theory of *associazione dei travagli*. He studies there all the advantages derived from these, justly considering them a cause of improvement in production. He also initiated with CUSTODI and ROMAGNOSI the *Annali universali di Statistica* (1824-1871), continued by Sacchi, which form one of the best collections of economic, statistical, and social studies which Italy can boast of. Among the many works of this author, besides the numerous writings in the *Annali* and his economic papers of local interest may be noted:—*Del merito e delle ricompense*, etc., Milano, 1818.—*Filosofia della Statistica*, Milano, 1826.—*Indole, estensione e vantaggi della Statistica*, Milano, 1809.—*Logica Statistica*, Milano, 1808.—*Tavole Statistiche*, etc., Milano, 1808.

A. B.

GIRARDIN, ÉMILE DE (1806-1886), born and died at Paris, was a man who carried everything to extremes. An unscrupulous speculator, an original and impartial thinker, a devoted friend, active in business, eminent as a man of letters, and constantly seeking notoriety, he loved discussion above all things, though it should only end in paradox. He was proud, rash, brave, and chivalrous. The natural son of Alexander Comte de Girardin, he accepted his lot in life with courage, almost glorying in it. He was appointed inspector-general of the *Beaux Arts* in 1828. Two years later he founded the journal *Le Voleur* afterwards *La Mode*. After the revolution of 1830 he warmly took up the cause of cheap periodical literature. This of all the acts of his life was the one which brought him the best deserved reputation.

He proposed to Casimir Périer to apply that system to the *Moniteur universel*, then the official journal, and to reduce its price to one sou. The minister refused, with a smile of contempt—he was not far-sighted enough to perceive what a force the cheap press might become. Girardin, repulsed by him, founded

the *Journal des connaissances utiles* at the price of four frs. a year. This obtained 130,000 subscribers. He next became the champion of savings banks, freely spending his own money, though he was then not wealthy, to encourage them. Next he established the *Musée des familles*, a periodical which was a formidable competitor to the *Magasin pittoresque*. After founding other periodicals, he plunged into such speculations as the mines of Saint Bérain. After this Girardin commenced his first important attempt to establish a cheap daily paper. On the 1st July 1836, *La Presse* appeared, a journal costing forty frs. a year, while all the other great newspapers were charging eighty frs. Success attended this bold enterprise. It brought on, however, a duel with Armand Carrel, in which Girardin had the misfortune to kill his opponent. He made a vow never to fight a duel again, this last had been his fourth, and, whatsoever the provocation, kept his oath. In 1834 he became a deputy, and retained his seat till 1848. He professed at that time to belong to no political party, and to be attached to no form of government, declaring himself on different occasions in favour of absolute liberty. The revolution of 1848 came on, and notwithstanding all that he had said he took up a side, warmly professing confidence in the new order of things. But this state of feeling did not last long. He was annoyed at not being elected a member of the constituent assembly, and was embittered by an illegal imprisonment which he suffered. He sacrificed his political sympathies to his personal animosity against General Cavaignac. He took an active part in the presidential elections of the 10th December 1848 in favour of Louis Napoléon Bonaparte, who knew his character so little that he omitted to appoint him one of his ministers—ministerial position being at this time the height of Girardin's ambition. The unsteadiness of his principles and the force of public opinion drove him into isolation—the undisciplined character of his mind retained him in that condition. At last a district of the department of the *Bas-Rhin* sent him to parliament only a short time before its violent dispersion. The second of December drove him into exile, whence he speedily returned, connected himself again with *La Presse*, left it, returned to it, quitted it again, then bought the newspaper *La Liberté*. His fertile pen revived the prosperity of that journal. Shortly after this Girardin got into favour at court and was named a senator, unhappily in time to urge his country into the war of 1870 so fatal for France. He then founded the paper *La France*, supported the government of Thiers, and energetically attacked Marshal MacMahon. The last ten years of his life were scarcely less active than those which had preceded, but the public paid no further attention to him.

Among the great mass of his works a good many were concerned with political economy, the following being the more important: *De l'instruction publique en France*, 1838.—*De la liberté du commerce et de la protection de l'industrie.* Letters exchanged between Ad. Blanqui and Émile de Girardin, Paris, 1846-47, 8vo.—*L'abolition de la misère par l'élévation des salaires*, 1850, 8vo.—*L'Impôt*, 8vo, 1853. In this last work he declared himself in favour of a single tax, which he proposes to make the basis of an insurance against those risks which disturb owners in the enjoyment of their possessions.—*Questions administratives et financières*, 1858. A. C. f.

GIUSTINIANI, D. Bernardo, was a priest (17th century). He is known in connection with a dispute as to lawful and unlawful forms of exchange. The application of the then existing theories of the canonists on usury led to difficulties in the new contracts entered into by dealers in the different kinds of exchange. According to the canonists, profit on exchange was lawful, provided it was real and did not conceal usury. The *cambio colla rincorsa*, as it was called, which Padre Giustiniani opposed, was practised in order to conceal usury. He describes it thus: "Titius, an inhabitant of Genoa, requires 1000 scudi, and asks Cajo, a money-lender, to supply them; saying to him, 'Arrange this for me on bills on Piacenza.' This is done as follows:—Cajo writes to his agent in Piacenza telling him to pay the sum to himself, crediting himself and debiting Titius, and after computing the charge to remit the debt and credit to Genoa—and thus it is done." In this manner money was borrowed in the kingdom of Naples, and as much as 30 per cent per annum paid. Giustiniani shows clearly that all this is merely a semblance of an exchange operation entered into to conceal a loan of money on usury. Some money-lenders even told him that they did not really send letters of exchange, but only made notes in their books. Starting from the principle, prevalent in those days, that usurious loans of money are wrong, Giustiniani's reasoning is sound. *Breve trattato delle continuationi dei Cambi*, Genoa, 1619.

GLANVILL, Ranulf (died 1190, at the siege of Acre), sheriff, judge, and chief justiciar, 1180, under Henry II. He fought for the king against the Scots in the rebellion of 1174; in 1185 he took the cross, which perhaps accounts for his being deprived of the justiciarship on the accession of Richard I. He took a large part in carrying out Henry's legal and judicial reforms, especially in organising the *Curia Regis*—the later king's bench. A collection of the laws of England was drawn up by him (Hoveden, end of 1180), and he wrote a treatise, *De Legibus et Consuetudinibus Regni Angliæ*, which "deals principally with procedure or the mode of

enforcing legal rights, but incidentally also with the rights themselves" (Digby, *Real Property*, 68). Incidentally therefore, apart from the invaluable information concerning the legal practice of the time, much light is thrown upon the tenure of land through all classes, and upon the status, both legal and economic, of the serfs. If his account is too much coloured by legal theory and maxims of the Roman law, giving no hint of the variety of rights and customs ascertained by historical research, Glanvill remains valuable as the earliest writer who has left any definite description of the land economy of his time.

[Roger of Hoveden (Stubbs), ii. Pref. xxii. and iii. Pref. xxiii.—Kate Norgate, *Angevin Kings*, ii. 279 and notes.—Extracts in Stubbs's *Select Charters*, and Digby's *Hist. of the Law of Real Property*.] E. G. P.

GLEBE LAND. Church land. The endowments of the church have consisted mainly of land from very early times: to each parish church belonged a number of pieces of land varying in size and position according to the nature of the soil and the manner of cultivation, and these have been added to by more recent gifts. The word glebe, which meant simply farm, has become restricted in meaning, and now means land belonging to a parish church, which the parson may farm himself or let for a short term of years, forming, with tithes, etc, the endowment of the church.

GLOCK or GLOCKE, see KLOCK, KASPAR.

GLUT is a name (cp. glutton) given to abundance by those who, for any reason good or bad, look on it as pernicious.

An unusual abundance of a particular commodity often reduces its price so much that it is injurious to the interests of those who produce the commodity for sale, *i.e.* in order to exchange it for other commodities. These persons accordingly say that there is a glut, or that the market is glutted, whenever there is so much of the commodity they sell that it cannot be disposed of at prices fairly remunerative to them. Purchasers on the other hand merely say that the commodity is plentiful and cheap.

Ricardo (Principles, ch. xxi., in *Works*, p. 176), following J. B. Say (*Traité*, L. i. ch. xv.) and James Mill (*Commerce Defended*, p. 81), denies the possibility of a "universal glut"—a glut, that is, of all commodities taken together simultaneously. Malthus, following Sismondi (*Nouveaux Principes*, L. iv. ch. iv.), holds in his *Political Economy* (p. 353 ff.) that a "general glut" is possible, and in his *Definitions* (p. 247) he says "a glut is said to be general when either from superabundance of supply or diminution of demand, a considerable mass of commodities falls below the elementary costs of production." [For a discussion of this question see DÉBOUCHÉS, THÉORIE DES; OVER-PRODUCTION.] E. C.

GODFREY, MICHAEL (d. 1695), brother of Sir Edmundbury Godfrey, was a financier and closely connected with Paterson in the formation of the Bank of England, of which he became the first deputy-governor in 1694. Macaulay states that he was one of the ablest, most upright, and opulent of the merchant princes of London of his day. He appears also to have been connected with Heathcote and PATERSON in their opposition to the monopoly possessed by the East India Company. Godfrey was killed in the trenches before Namur, whither he had been sent to the king in reference to money matters. His death caused a fall of two per cent in the price of bank stock. He was author of *A short account of the Bank of England*, London, 1694. The formation of the bank called forth strong opposition, and this tract of twelve pages was written in its defence, pointing out the advantages to be derived from it, especially as regards the lowering of the rate of interest throughout the country, and answering the objections made by its opponents. These, according to Godfrey, were chiefly goldsmiths and others who foresaw that their exorbitant gains were likely to be reduced.

[Thorold Rogers, *The first nine years of the Bank of England*, Oxford, 1887.—Macaulay, *History of England*.—Saxe-Bannister, *Writings of William Paterson*, 1859, vol. ii.] R. H. H.

GODIN, JEAN BAPTISTE ANDRÉ (1817-1888), was born at Esquéhéries, Aisne, France, and died at Guise, Aisne, after a life of beneficent activity as a captain of industry. The son of an artisan, he was but poorly educated, and in his twelfth year left school to join his father in the ironworks. At seventeen he started on a tour of France as a journeyman. The industrial revolution and the ideas of FOURIER and SAINT SIMON combined to dissatisfy him with the wages system as he saw it, and he determined that if ever he rose to be an employer of labour he would endeavour to raise the level of the workman's life and make it more pleasant and less laborious. In 1837 he returned to his native village, and after his marriage in 1840 opened a small factory for apparatus for heating, with one or two assistants. Employing the process of casting for portions of stoves, etc., not hitherto made in that way, he soon succeeded in increasing his business, until in 1846 he employed some thirty hands, and found the lack of communication at Esquéhéries becoming a serious drawback. He therefore removed his factory to Guise, on the river Oise. At the time of Godin's death in 1888 the annual output of his works exceeded in value four millions of francs (£160,000), of which nearly one half was

paid out for wages to upwards of one thousand workpeople.

Godin proved a model employer. His constant solicitude for the comfort of his workmen, with whom he kept in the closest touch as their colleague rather than their master, exhibited itself in his encouragement of benefit and insurance and co-operative societies, his establishment of free schools, nurseries, libraries, theatres, clubs, etc. in his social palace or FAMILISTÈRE, founded in 1859, and in the gradual introduction of a system of profit-sharing, developing through industrial partnership into a co-operative company on a broad basis, which should continue to work smoothly even after its founders had personally passed away. This well-built and well-organised CITÉ OUVRIÈRE offers many collective facilities for comfort and enjoyment rarely within the reach of individual workmen elsewhere; and the solidarity of its members in their social and industrial relations constitutes a guarantee of continued stability.

After the revolution of 1848 Godin subscribed £4000 (at that time the third of his fortune) towards the ill-starred expedition of Considérant to form a Fourierist community in Texas. The failure of this expedition was in some sense a disillusion to Godin. With his more practical intelligence he laid the plans of his own *Familistère*, and successfully carried them out. In 1870 he was elected *conseiller-général* by the republican party, and as president of the municipal commission of Guise, during the military occupation of that town by the Germans, he inspired it to refuse to pay any contribution to the victorious army—a refusal which the Germans were unable to overcome. In 1871 Godin was elected deputy for his department, and remained a member of the Chamber till 1876, when he withdrew from practical politics to devote the rest of his life to the management of the *Familistère*, the publication of its journal, *Le Devoir*, and the elaboration of his industrial and political ideas in the writings mentioned below. In 1882 he was created a knight of the legion of honour. In 1886 he married his second wife, who had for twenty-five years acted as his secretary, and has since edited his posthumous work, *La République du Travail et la Réforme Parlementaire*, 1889.

The other principal writings of Godin are: *Solutions Sociales*, 1871.—*La Richesse au Service du Peuple.*—*Les Socialistes et les Droits du Travail.*—*La Politique du Travail et la Politique des Privilèges.*—*La Souveraineté et les Droits du Peuple.*—*Mutualité Sociale*, 1880.—*Le Gouvernement: ce qu'il a été, ce qu'il doit être*, 1883. In these works he exhibits the bold and original qualities which distinguished him as a man of affairs, but shows the limitations of an untrained mind. He proposed the abolition of inheritance by intestacy, except by direct descent, and graduated death-duties rising from 1 per cent on £80 or less to 50 per cent on £200,000, the state devoting the proceeds to the payment of its expenses, to the exclusion of all other forms of taxation. By this means he considered all members of the community would be provided with equality of opportunity. He urged peace between nations, and between the industrial classes of a nation, the latter result to be attained by the legal association of masters and men into groups of common interest.

[See the articles CITÉ OUVRIÈRE and FAMILISTÈRE, and the works there referred to.] H. H.

GODWIN, WILLIAM (1756-1836), author of *Enquiry concerning Political Justice*, London, 1793, 4to, the 2nd edition with material alterations, 1796, 8vo. The great doctrine of the treatise was declared by Godwin himself, *Thoughts on Dr. Parr's Spital Sermon*, 1801, to be the perfectibility of man. The characters of men are blanks, which their external circumstances, and, above all, political institutions, fill in. Justice is a general appellation for all human duty. Government is an evil, but necessary; "it finds our rights invaded, and substitutes an invasion less mischievous for one that is more so." It is perpetuated "by the infantine and uninstructed confidence of the many"; but its action should be circumscribed within narrow limits. Society can only declare and interpret, it cannot enact. Private property in the labour of others is unjust, but is not therefore to be violently uprooted. Still, the goal must be complete equality of conditions. In treating of the benefits of a system of equality, Godwin is confronted with the objection from the principle of population. His answer is the conjecture of Franklin that "mind will one day become omnipotent over matter." The speculations of Godwin—in the essay on "Avarice and Profusion" in *The Enquirer*, 1797, 8vo—provoked the *Essay on Population* (see MALTHUS). In the *Thoughts on Dr. Parr's Spital Sermon*, pp. 54-77 are devoted to the essay, but, at that time, the main proposition of the argument appeared to Godwin "no less conclusive than new." He only complained of the limitation of the checks to misery and vice, so that the inclusion of the prudential checks, in later editions of the essay, may be in part due to Godwin. As time went on, however, and the views of the essay became more generally adopted, the attitude of Godwin grew more hostile, until in 1820 he published his work *Of Population*, which had taken two years in writing, and which purports to be a complete refutation of the essay.

[Godwin's argument will be found ably criticised in Mr. Bonar's *Malthus*, London, 1885, pp. 364-371; see also *William Godwin*, etc., by C. Kegan Paul, 2 vols. 1876; and the article in the *Dictionary of National Biography*, vol. xxii. p. 64, by Leslie Stephen.] H. E. E.

In his *Enquirer*, a series of essays (1797), there is an essay on "Riches and Poverty"

(pt. ii. essay i.), in which amongst other things Godwin maintains that one evil result of poverty is the absence of leisure entailed on the poor man. He looks forward to a time when the economy of resources, better division of labour, and better division of wealth. will make it unnecessary for any one to give more than one-tenth or even one-twentieth part of the labour now bestowed on the earning of a livelihood (cp. More, Owen).

Another essay, on "Avarice and Profusion," deals with the question of luxury in the manner of Tolstoi. If the rich would relieve the poor, they must *share* their labour, not by inventing new luxuries set the poor new tasks. Human wants need to be diminished rather than increased. Equality is always Godwin's chief aspiration. A third essay, on "Beggars," is adverse to indiscriminate charity as creating professional beggars, "the most abject thing upon the face of the earth"; but the course of the author's reflections on this matter does not run smooth. He insists that our feelings of humanity demand some indulgence.

Anarchism has never, on the whole, been so consistently, so patiently and so peaceably worked out into its details as in Godwin's *Political Justice* (1793). The use of violence in any form, even in penal laws, is absolutely condemned. The spread of intellectual enlightenment is to work the whole change. War is treated as due to the too limited intercourse between individual citizens of one nation and those of another, governments and diplomatists having too much power (cp. Cobden).

Yet Godwin's allusions to the economists are not complimentary. He refers to the famous example of division of labour in the *Wealth of Nations* (pin-making), only to sneer at it; "The division of labour, as it has been developed by commercial writers, is the offspring of avarice" (*Pol. Justice*, vii. viii.).

At a later period of his life, when Malthus seemed to have convinced even Godwin's friends, the *Essay on Population* naturally became the object of Godwin's special enmity. With the aid of his friend Booth, he attacked its principles and its figures with all the force he could muster. The geometrical and arithmetical ratios are rejected. The increase in the American population is declared to be exceptional. He sums up his reasoning in three arguments:—(1) Population in many states is not increasing at all; (2) every new improvement enables the two ratios to start at par; (3) the excess must begin with the infants, and infants need comparatively little food and give us fair warning. Positively he contends that in all cases where there is excess the cause lies in political institutions (Godwin, *Population*, 1820, pp. 485 *seq.*). He was too sanguine in believing he had routed his opponent; many admirers of the *Political Justice* and *Caleb Williams*, will regret that the author of these remarkable books should have written so much that was of little merit.

J. B.

GOGEL, Isaac Jan Alexander (1765-1821), born at Vugt (North Brabant), member of a business house at Amsterdam, played a great part in the revolutionary and French period of 1795-1815, being a warm adherent of the patriotic (anti-Orangist) party. He was the head of the department of finance, first from 1798-1801, then under the Pensionary Schimmelpenninck (1805), under King Louis Napoleon (1806-1808), and the French government (1810-1813), when he was also a member of the French *Conseil d'État*. After the restoration he undertook a manufactory of blue at Overveen near Haarlem, and lived there until his death (1821). He was an economist especially in a practical sense. The present Dutch system of taxes is to a large extent his work. His ideas on this subject may be learned best by studying that system itself as it existed in the years 1805-1810, and his work: *Memoriën en Correspondentiën betrekkelijh den Staat van 's Rijks geldmiddelen* (Memorials and Correspondence on the State of the Finances of the Kingdom), written by the order of King William I., first published 1844, by the author's son. His principles are these: Taxes should be proportional to the wealth of the contributors, and to the measure of protection they stand in need of. Direct taxes are to be preferred to indirect, the latter being only allowable for fiscal ends, and to draw contributions from the less wealthy classes. Yet he is an opponent of an income-tax because he does not believe in the possibility of obtaining the necessary information. The mode of levying ought to be simple, the laws clear; he recommends few functionaries, centralisation, and special judges.

When a director of the Amsterdam loan-bank (1801), he proposed the creation of a general bank of issue and deposit, intended to be a private concern under government control. This plan was strongly opposed, but a few years later (in 1814) it became the basis of the charter granted to the Netherland Bank.

Gogel was a staunch adherent to the rule of *laissez-faire* in matters of trade and commerce. He disapproved of duties on articles of export, *e.g.* tobacco, in opposition to the Emperor Napoleon I., and vigorously opposed a measure proposed by Louis Napoleon containing a new regulation of gilds (1808). A. F. v. L.

GOLD

Gold as consumed in Industry, p. 218; Gold as Standard, p. 220; Gold Bullion, as a Commodity at the Mints, p. 224; Gold, Distribution and Production of, p. 225; Gold Certificates, p. 226; Gold Notes, p. 226; Gold Points in Foreign Exchanges, p. 226.

Gold, as consumed in Industry. Gold was probably employed for ornament before

it came into use as money, although in the earliest records the monetary use is mentioned as much as the other. Its application to ornamental purposes was probably very ancient. There are instances of its having been applied to industrial purposes among savages who were unacquainted with iron and other metals. Its employment in the arts, so far as our records go, appears to have originated in the east, probably in India. It is now chiefly used for watch-cases, chains, rings, and other articles of jewellery; for plate and similar ornaments; for gilding, as gold-leaf and wire; in dentistry, etc., etc.

It is very difficult to form an estimate of the amount used for purposes other than coinage; and in all serious calculations of this quantity no opinion is expressed as to the requirements of Asia. A very great deal of gold is undoubtedly consumed in the arts in India, more, probably, indeed, than in any other single country. Mr. S. Pixley estimated very tentatively, in giving evidence before the Gold and Silver Commission in 1886, that £5,000,000 of gold were annually exported to India for this purpose alone; but as the total annual imports of gold into India are now less than that sum, there is doubtless some over-estimate here.

As regards former centuries, JACOB has endeavoured to arrive at an approximate idea of the proportion of the precious metals applied to industrial uses; but we have no means of judging how far he was correct, even for the time when he wrote. He considered that the proportion of the precious metals (gold and silver) applied to purposes other than coin was one-tenth of the whole quantity produced in the 16th century, and one-fifth in the 17th; while he concludes that in the 110 years, 1700-1810, "the quantity of gold and silver which was converted into other objects than coin amounted to two-thirds of that which was left in Europe, after the part which was conveyed to Asia is subtracted from the total produce of the mines." But Jacob's estimate of the quantity of gold annually consumed in industry about 1830 is undoubtedly much too high, although he was at considerable pains to make careful inquiries. A better estimate is that of A. von HUMBOLDT, who supposes the European consumption in 1824 to have been about 9200 kilogrammes.

The only official inquiries on this subject are those instituted in recent years by the director of the United States mint. In that country a return is now annually furnished by the state and by private firms of the amount of gold used for industrial purposes. A certain amount, estimated recently at from $1,500,000 (£300,000) to $3,500,000 (£700,000), is then added as the value of coin melted down by jewellers and others for repairs and similar requirements. The whole amount appears by these returns to have increased considerably of late years, being about $11,000,000 (£2,200,000) in 1880, $19,000,000 (£3,800,000) in 1892, and $29,000,000 (£5,800,000) in 1903. But these estimates are considered by English statisticians to be too high.

For the civilised world—*i.e.* Europe and the United States—the best estimates are undoubtedly those of the late Dr. A. SOETBEER. These are based on careful computations, and are deduced mainly from official returns of the quantities stamped by government in each country, these quantities being subjected to various corrections, and estimates being made of the amount which escapes stamping, or which is old material melted down, etc. His estimates are, for the period 1831-40, about 18,000 kilogrammes annually, and, in 1871-80, about 84,000 kilogrammes annually, while he puts the whole quantity of gold used in industry during the period 1831-1880 at 2,070,000 kilogrammes. These are the net quantities—*i.e.* a deduction has been made on account of old material re-melted, but gold melted from coin is included. For 1883 he considers the gross consumption to have been 110,000 kilogrammes, less 20,000 kilogrammes for old material, or 90,000 kilogrammes net. Since then the requirements have still further increased, and the net consumption, following Soetbeer's calculations, must be put, in 1890, at between 100,000 and 120,000 kilogrammes. It is impossible to say how much of this represents coin melted down. In making the above calculations Soetbeer accepts the estimate of the director of the United States mint for that country. English economists generally hold Soetbeer's figures to be slightly too high, this being possibly due to his incorporation of the American values.

As regards the quantities consumed in different countries, Soetbeer gives the following (annual average, about the year 1885):—

	Gross Use.	£ mill.	Subtract for old Material.	Net Use.	£ mill.
	kg.		per cent.	kg.	
United States	21,700	*2·71*	*10*	19,500	*2·44*
Great Britain	20,000	*2·50*	*15*	17,000	*2·12*
France	21,000	*2·62*	*20*	16,800	*2·10*
Germany	15,000	*1·87*	*20*	12,000	*1·50*
Switzerland	15,000	*1·87*	*30*	10,500	*1·31*
Holland and Belgium	3,200	*·40*	*20*	2,500	*·31*
Austria-Hungary	2,800	*·35*	*15*	2,400	*·30*
Italy	6,000	*·75*	*25*	4,500	*·56*
Russia	3,000	*·38*	*20*	2,400	*·30*
Other countries (Europe)	2,300	*·29*		2,000	*·25*
Total	110,000	*13·75*	..	89,600	*11·20*

No opinion can be given of the stock of gold actually in existence in a form other than bullion or coin.

A point still to be considered is, what proportion do these quantities bear to the whole amount of gold annually produced? According

to the statement of the United States Mint Report, combined with the earlier estimates of Dr. Adolf Soetbeer, the value of the production of gold in the world since 1860 is £1,305,000,000. It is estimated that 30 per cent of this, £390,000,000, is employed in the arts and industry. Deducting this, we have a value of £915,000,000 to be added to the coinage of the world.

The weight of this is stated as 315,000,000 ounces of fine gold. Of this, there may be estimated as 95,000,000 ounces employed in industry. It is impossible to estimate the amount of old material employed in this manner. The figures for 1903 were, according to the same report, 3,690,000 ounces, valued at £15,000,000, new material only being taken into account.

Papers*, Nos. C., 5099, 5248, 5512.—Dr. S. M'C. Lindsay, *Preisbewegung der Edelmetalle seit, 1850*, Jena, 1893.] R. H. H.

GOLD AS STANDARD. In history gold appears first as a valuable commodity. Thus in the new world the Peruvians, at the time of the Spanish invasion, valued, used, and treasured the metal, but do not appear to have employed it as a medium of exchange. Rare and highly esteemed, portable, durable, readily divisible, homogeneous, and easily worked, it soon came into use independently among many nations, and at early stages of civilisation, as a medium of exchange, to facilitate the process of barter. Thus the Mexicans used quills of gold dust for this purpose at the time of Cortes. And in the old world, among the Anglo-Saxons of the 9th century, rings of gold, the chief treasure of the kings, seem to have served as a medium of exchange, and by weight as a rough measure of value (Beowulf). These two functions of the metal are not in fact easily separated. The next great stage in the adaptation of the metal as an exact measure of value was the introduction of coinage—an invention which appears to have had a single origin to the east of the Mediterranean, and was adopted by different peoples at different chronological epochs, though at nearly the same stage of economic development. Among the Greeks its progress may be traced almost from its beginnings by extant coins.

Uncoined gold may be a measure of value, but it can hardly be a standard. A measure of value may be said to become a standard when recognised and defined by law, when legal payments are estimated in legal units appointed for that purpose. Thus oxen may be said to be recognised in some Germanic codes as a standard of value, side by side with gold and silver coins. When a piece of gold received the stamp of a king or a city it was thereby effectively declared to be such a unit.

It is unnecessary to enter on the barren discussion whether value can really be measured. Accurately or inaccurately, it is measured in millions of daily transactions, and the attempt to devise an accurate standard measure begins almost with the beginning of history. The definition of value "as power in exchange," though it leaves much to be desired in lucidity and theoretical completeness, may be accepted for the purposes of discussion. The object whose power in exchange is most nearly constant with all persons and at all times will make the best standard measure of value.

Since very early times gold coins have been used as a standard of value, but gold itself can hardly be said to serve as a standard of value until mint regulations have been devised to secure that the value of gold coins shall exactly conform to the value of the gold contained in them. The necessary regulations are these: (1) Gold coins of a certain stamp may only deviate within narrow and fixed limits from a well-known standard of weight and fineness (see REMEDY). To secure this end, means must be taken to withdraw periodically from circulation coins that have become light through wear and tear. (2) All who bring gold bullion to the mint must have the right to receive in return an equivalent in the form of coins. If the coinage of gold is not *free*, the action of the government may tend to a restriction of the coinage, and *pro tanto* raise its value above bullion level. The custom of coining for government profit, usual in ancient and mediæval times, and not altogether unknown in our own, tends to this result. Again, if coinage is not *gratuitous*, there is a margin of possible variation between the value of gold as bullion, and the same *plus* the charge for seigniorage (see SEIGNIORAGE). (3) Exportation and melting of coins must be permitted without restriction. Otherwise the supply of coins may from time to time exceed the needs of the community, and the value of the coins will fall below bullion level.

If the government of any country enacts that gold coins issued under the above conditions shall be unlimited legal tender in payment of debts contracted in the terms of the customary measure of value, gold is in that country a standard of value. Given these conditions, gold will be the sole standard of value, if the issue

of other legal tenders is so regulated and limited that their value shall always conform to the value of the gold coins, of which they represent a definite multiple or fraction.

If both gold and silver are freely coined, and are unlimited legal tender in payment of all debts, at a fixed rate, a certain number of silver units being treated as equivalent to one gold unit, we have a joint or bimetallic standard of value. Gold is still a standard, so long as it circulates in the country at all on these terms, but it is a standard jointly with the other metal: the two standards are inseparable so long as the system works. This system, with all the conditions necessary to the maintenance of a joint standard, was in force in France from 1803-1874. A similar system is of high antiquity. It would appear that coins of gold and silver circulated at a fixed rate in Greek cities: the rate being $12\frac{1}{2}$ to 1. Philip of Macedon seems to have made both his gold and his silver coins full legal tender, at this fixed rate, and his gold coins had a wide circulation even outside the Macedonian empire. Under the Roman republic and early empire gold and silver coins circulated at a fixed rate, the unit of value being the silver DENARIUS, or the SESTERTIUS (money of account). Under Constantine the gold SOLIDUS became the chief unit of value; the denarius a subordinate unit. But we do not know enough about the mint regulations of the Greek and Roman states to say with any certainty whether gold or silver was the standard; or, if there was a true joint standard. It seems more probable that neither metal was the standard, but that the coins were a joint standard at a fixed rate, circulating at a price considerably above their bullion value.

Professor Soetbeer's researches appear to make it probable that the ratio of $12\frac{1}{2}$ to 1, as between silver and gold coins, was preserved throughout the Græco-Roman period by the custom of mint artificers and mint authorities; but we know nothing about the market for bullion. (See Mommsen, *Hist. of Rome*, on these points.)

Throughout the middle ages, and indeed till recent times, silver coins were the standard generally in Europe. The position of gold was undefined and anomalous.

Under another system, sometimes known as unrated BIMETALLISM, both gold and silver are freely coined and circulate at no fixed rate. It naturally results that one metal is by consent though not by law adopted as the standard of value, the relative value of the other metal being settled by private agreement for each case. This is not a true bimetallic system, the conditions of legal tender being confused; and may arise from circumstances such as existed in England between 1660 and 1717, when guineas of the nominal value of 20s. were freely coined, and also silver coins 20 shillings to the pound, the pound (money of account) being the unit of value. This system aimed at rated bimetallism—a guinea = a pound. But the silver coins were so overrated, mainly owing to their worn and clipped condition, that no one would give guineas at the legal rate,—guineas were accepted at a rate varying from 22s. to 30s. The standard of value, as is theoretically possible in a bimetallic community, was in effect a single metal—silver: or perhaps it would be more correct to say the silver coins,—which were also unlimited legal tender.

When the treasury in 1698 fixed 21s. 6d. as the highest rate at which guineas would be accepted by government in payment of taxes, a step was taken in the direction of true bimetallism, which was rendered possible by the recoinage of the silver currency in the latter years of the reign of William III. The last step was taken in 1717 (Newton's Reform), when guineas were made full and unlimited legal tender at 21s. This rate (about $15\frac{1}{2}$ to 1) was above the market rate, and occasioned a great influx of gold to the mint; the silver coinage having returned to its silver value. Nevertheless the bimetallic standard was maintained without serious difficulty until 1775, when a limit was placed for legal tender of silver coins by tale. In 1797 the Bank suspended gold payments, and the country was for some twenty years confined to the use of inconvertible paper. In 1816, with a view to the return to cash payments, gold was established as the sole unlimited legal tender and standard. The free coinage of silver, which had been suspended since 1798, was no longer permitted, and the legal tender of silver was limited to 40s.

The study of monetary science has led in the last two centuries to the adoption of mint regulations and improvements in coinage without which a true metallic standard cannot exist. The influence of Lord LIVERPOOL (father and son, *q.v.*) led to the adoption by this country in 1816 of gold as the sole standard. Since 1872 the chief countries of the civilised world have followed the example of England. It is important therefore to be able to observe and estimate any variations in the value of gold; and for this purpose it is necessary that the laws and circumstances which affect its value should be clearly understood.

The value of gold depends on interaction of demand and supply. Demand for gold is (*a*) demand for currency; (*b*) demand for the arts (see GOLD AS CONSUMED IN INDUSTRY); (*c*) demand for hoarding, which tends theoretically to vary inversely with the value of gold—a smaller hoard of dearer metal being equivalent to a larger hoard of the cheaper (see HOARDING). Alterations in the legal standard of any country will affect this demand in so far as they increase the amount of gold required for daily use in that country, which need not necessarily be the case.

If the value of gold falls or rises, more or less gold will be required to do the same work as currency. (*d*) Demand for banking reserves. This demand is to a certain extent alternative to the demand for currency (see RESERVES, BANKING).

The existence of an effective bimetallic area of considerable extent tends to keep the value of gold in all civilised countries at a bimetallic level. During the period 1803-1873, if gold appreciated in relation to silver, the demand for silver in France increased, and gold was exported. Similarly during the period of enormous gold production in California and Australia, 1850-1865, France was taking gold and exporting silver, and thus no serious deviation in the proportion between the values of the two metals from the standard of $15\frac{1}{2}$ to 1 was felt. 1853-1860 France coined £155,000,000 sterling in gold, and meanwhile exported great quantities of silver, especially to the east.

Of changes in the demand for gold the most important are those that may arise from alterations in the standard of any country. When Germany in 1872 adopted a gold standard, she at once proceeded to sell silver coins and buy gold for coinage. Between 1872 and 1878 inclusive, about £80,000,000 sterling of gold were coined in Germany. Austria-Hungary prepared for the adoption of a gold standard by the accumulation of a reserve of some £30,000,000 sterling, and Italy secured about £20,000,000 for the same purpose. Between 1873 and 1881 the United States coined nearly £100,000,000; which may be taken approximately as the additional demand due to the adoption of a gold standard by that country in 1878.

It will thus be seen that every country, by altering its mint regulations, has power to alter the metallic standard of value *pro tanto* in every other country using a metallic standard; and from this point of view the contention of those who desire to make currency arrangements a matter of international agreement may be accepted.

The demand for gold and silver as currency has until recent times been alternative. If more silver was used as currency, less gold, and *vice versa*. Recent changes have interfered with this substitution. The international measure of value, gold, has been more and more isolated; silver has been becoming a commodity like other commodities; any increase of supply of gold or any diminution of supply acts with full force upon the standard of value; there is no longer a question of the proportion of any new demand or supply to the total stock of gold and silver, but of its proportion to the total stock of gold alone.

This general change in the currency of the civilised world has been rendered possible partly by the enormous increase in the production of gold during the last fifty years, partly by the extension of the banking system, and the greater use of banking facilities, which enable a given amount of metallic currency to effect the exchange of a much greater amount of commodities. Gold, the international standard of value, still circulates in considerable quantities; but it chiefly serves as a reserve to support the fiduciary currency and the book-entry transactions which to a large extent replace it in ordinary use. But this system has its disadvantages. Any sudden demand on the available supply of gold may remove in one country or in many the support on which the fiduciary currency rests. Promises to pay may cease to be current; gold may be eagerly appropriated and jealously held; hence follow temporary fluctuations in the standard of value through increased demand, which disturb for a time all commercial relations.

On the side of supply the value of gold depends, primarily, on the stock in existence. The stock in existence can hardly be estimated at less than £1,500,000,000 sterling; it may well be more. Annual additions have little power to affect the value of so large a stock. But a great increase in production, extended over a long period, as has been the case since 1850, may considerably affect the value.

Some writers on economics have assumed that the value of gold depends solely on cost of production. Others have boldly stated that gold is always produced at a loss. It is probably true that some gold is always produced at a loss. The question with regard to gold is not one of the margin of profitable production, but of unprofitable production. When alluvial gold deposits are being worked this margin is very low. Many claims are worked at a loss under the incentive of gains secured in others. When gold is found in the quartz, at present the chief source of gold production, much capital is wasted in sinking shafts and erecting machinery for unprofitable mines. But no mine will long continue to be worked that does not produce enough to pay current expenses. Circumstances vary, and fluctuations are great. It is, however, certain that gold may continue to be worked below the marginal cost of production.

Such are the conditions that affect the value of gold—the most general and international standard of value. Under these complicated influences it would be surprising if the value of gold remained stable over long periods of time For short periods this value has great stability owing to the high proportion that the total stock of gold bears to any possible sudden changes in the amount demanded or supplied. An exception may perhaps be made in cases where inflated credit is suddenly shaken. The fall in prices that then occurs, accompanied by

an exceptional demand for gold, is in one aspect the result of a sudden and temporary variation in the standard.

But over long periods great changes have taken place in the value of gold. These changes have been on the whole in the direction of depreciation, but there have been long periods of progressive appreciation. Such changes are very difficult to measure. No certain and unalterable test of value can be applied. The price of wheat, and the money wages of unskilled labour, are useful tests, but leave much to be desired on the score of accuracy. But such questions, however interesting, have only academic importance in so far as they relate to remote periods. The attempt to estimate the fluctuations of gold within a lifetime or a generation is one that must be made, and has often been made. It involves the most important consequences for trade and social relations.

An appreciating standard of value benefits the creditor at the expense of the debtor. A depreciating standard benefits the debtor at the expense of the creditor. It is often argued that if instability is unavoidable, it is better that the debtor should gain than that the creditor should. The masters of industry and commerce are debtors on a large scale. If the money values of their commodities are constantly rising by small increments, trade and industry are affected by a constant stimulus, such as is believed to have affected them between 1850 and 1866, and to have been succeeded, about 1875, by a continuous and progressive depression in all countries that use the gold standard. The burden of government debt is also increased by a rise in the value of gold. The social effects are more obscure though not less certain than those which appear in industry, trade, and taxation. To estimate such changes in the standard the following tests may be applied. The prices of commodities may be studied. If a general rise of prices, lasting over a considerable period, can be substantiated, a fall in the standard may be suspected. If a similar fall in prices appears, then a rise in the standard may be suggested as a possible explanation. But we must see if there be not some general cause or causes affecting commodities that will account for such fluctuations.

The wages earned by labour at different times may also be compared, especially those of unskilled labour. But here the changes affecting efficiency, supply, and demand are more obscure, and their results very difficult to estimate.

Finally, we may observe the causes affecting the supply of, and demand for, the metal or metals established as the standard of value. If two or all of these tests give a similar result, we may consider the change of the standard as sufficiently proved; but it cannot be measured accurately.

To take the recent period 1850-1905: Throughout this period the supply of gold has been largely in excess of all known previous epochs. That increase was largest in the period 1897-1905. Again in the period 1851-1866 no great new demand for gold coinage arose, except in France; which liberated a corresponding amount of silver for use as currency elsewhere. The increased demand for currency must in great measure have been met by the constant extension of banking facilities.

A study of the general prices of commodities by means of index-numbers establishes for the period 1850-1870 a considerable rise. Comparing the depressed year 1850 with the depressed year 1869 by means of Mr. Sauerbeck's figures, we get a rise of prices of about 27 per cent, and other methods (those of Dr. Giffen, Prof. Soetbeer, Mr. Inglis Palgrave, the *Economist*), give very similar results, though the exact proportion is differently estimated. And this in a period when improvements in methods of production, and transport, and exploitation of new countries might have been expected to cause a general fall in prices.

A general rise in money wages between 1850 and 1869 can hardly be denied. Thus the fact of a fall in the standard of value between 1850 and 1870 seems proved; and 20 per cent is the most moderate estimate that can be accepted.

On the other hand, between 1870 and 1893, although the production of gold was still very great, it was less than in the previous twenty years. Great new demands on the stock of gold for currency were made by Germany, the United States, Italy, and Austria-Hungary. The consumption of gold for the arts increased, and has been very roughly estimated by Professor Soetbeer at 11½ millions sterling, nearly one half of the total annual production. The hoards of gold for war treasure by the great continental nations grew. The demand for gold in India (a new demand, specially important in the decade 1860-1870) continued, and absorbed, in the years 1870-1904, over £125,000,000. The bulk of trade over the whole world increased steadily, and a larger proportion of it was conducted on a gold basis.

The general prices of commodities which had previously risen showed during this period a considerable net fall; bringing them lower than they had been in 1850. The general level of wages was probably as low in 1905 as in 1870; though the fact of the fall, and especially its amount, is not so certain as the fall in commodities. This case is more uncertain than the other. The circumstances of demand and supply lead us to expect a rise in the standard; though, considering the great and continuous production of gold, it could not, on this ground alone, be certainly affirmed. The fall in commodities is a certain fact. But some such fall might have been anticipated from the

continued improvement of machinery, methods, and transport, and the development of new agricultural areas. And the wages of labour have not fallen in anything like the same proportion. The estimates of the appreciation of gold since 1873 and the corresponding depreciation of commodities have varied so much that it is hardly practicable to include them here—especially as at the present time (1905) the process appears to continue. Any estimate of this description must be very uncertain.

[This subject is so closely connected with that of bimetallism that a general reference may be made to the list given above under that head. The Report of the Indian Currency Committee, 1893, is the most valuable recent contribution to the literature of the subject. The following works may also be mentioned: Adolph Soetbeer, *Edelmetallproduktion und Werthverhältniss zwischen Gold und Silber*, 1493-1875, in Petermann's *Geographische Mittheilungen*, Gotha, 1879.—Dana Horton, *The Silver Pound*, London, 1887.—Del Mar, *A History of the Precious Metals*, London, 1880.—*A History of Money in Ancient Countries*, London, 1885.] S. M. L.

GOLD BULLION, AS A COMMODITY AT THE MINTS (see PRECIOUS METALS for bullion as an article of commerce, and GOLD AS CONSUMED IN INDUSTRY for use under that head). So many interesting and peculiar phenomena in the gold bullion trade, and so large a part of the status which it holds in relation to the standard of value, are due to the position in which gold stands at the mints of the world that, without trespassing upon its position in commerce and industry, or without touching upon the metallurgical and mechanical processes through which it passes before it appears clothed with the stamp of authority, a word may be said upon the treatment it receives as a commodity at the hands of the world's coining establishments.

All the mints of the civilised world are open to-day to this commodity in unlimited quantities at a fixed rate or price determined by law. The minor regulations differ in different countries, but the peculiar economic fact—an unlimited demand at a fixed and known rate—holds good for all alike. In England the royal mint, according to the act of 1870, must receive gold bullion when sent in parcels of not less than £100 nominal value. The master of the mint may refuse to receive, assay, or coin it if the standard value of the whole of the bullion is less than its gross weight, requiring a portion of it to be refined in order to bring it to standard fineness; and if the assay reports show that any of the ingots are brittle or contain iridium they will be returned to the depositor. For purposes of convenience it is customary to require intending depositors to give the deputy master of the mint two days' notice, and to furnish in duplicate forms, supplied at the mint, a statement of the mark and assay report on each ingot, and the name of the assayer on whose assay they purchased it. The ingots are then weighed by the proper officer of the mint, and a statement of their weights is added to each copy of the aforesaid forms, one of which is kept by the mint and depositor respectively. If the report of the mint's assayer differs from that furnished by the depositor, and is disputed by the latter, the consulting assayer of the mint makes a new assay, and his decision is final. When these conditions are complied with, and the bullion found to be 916·6, or eleven-twelfths fine, the full mint rate, £3 : 17 : 10½ per ounce, is paid without making any charge for coinage, but notice is not sent to the depositor, nor is the money actually paid, until the coinage of the bullion is completed.[1] This causes, therefore, a loss of time and interest on the value of the deposit to the depositor. He consequently prefers to take his bullion to the Bank of England, where he always receives its value immediately upon announcement of the results of the bank's assay, at a rate of £3 : 17 : 9, or 1½d. per ounce less than the mint rate. Thus as a matter of fact the English mint has in recent years dealt solely with the Bank of England for its gold bullion. When the Bank has a large stock in hand it requests the mint to take it and resume coinage of gold, and likewise when the mint desires to commence coinage of gold it sends notice to the Bank, which immediately furnishes or procures the bullion. The Coinage Act of 1870 in England has been modified in one particular by the Coinage Act of 1891, whereby light-weight coins, within the limits of reasonable wear and tear prescribed by law, will be received at the mint at their face value, whereas formerly they were dealt with merely as bullion and received according to weight. The injustice whereby the last holder had to bear the whole cost of loss by wear during the entire life of the coin has thus been removed, and the cost of recoinage is now charged to mint account. An exactly similar relation to that existing between the English mint and the Bank of England exists in Germany between the German mints and the Reichsbank. The present regulations governing the gold coinage of Germany are to be found in the order of the chancellor of June 8, 1875, and the Reichsbank law of

[1] England is the only country in which the price for gold is not quoted for the weight of the fine metal but for the "standard" weight—viz. for a quantity containing 11 parts gold and 1 part alloy, which is the proportion used for English gold coins, whilst in German, French, and American gold coins the proportion is 9 parts gold and 1 part alloy. Any deviations from the standard proportion in England are accounted for by deductions or additions to the weight brought into account, and in the same way in other countries the deviations from absolute fineness are accounted for by deduction, but, as a general rule, bars are not accepted unless they have a certain degree of fineness.

March 14, 1875, whereby 2784 marks are paid for every kilogram of fine gold, and the same is then coined into 2790 marks, thus allowing the mint a profit of 0·215 per cent to meet expenses of coinage. The Reichsbank pays exactly the same rate, and that immediately on ascertaining the weight and fineness, so that the mint is entirely dependent on the bank for the gold bullion it uses. The system in France and Italy, which countries are members of the Latin Union, differs somewhat from that of Germany and England. There gold bullion may be brought to the mints to be coined, and returned in coin of the realm upon completion of the work, usually within a period of ten to thirty days, but less a charge for coinage amounting to 6 francs 70 centimes per kilogram fine. In the United States of America the system is again quite different. Gold bullion is received at any mint or assay office. Of the former there are three, one each at Philadelphia, San Francisco, and New Orleans, and the assay offices are plentifully scattered over the country. The bullion is paid for at once upon ascertaining weight and fineness, generally within two days after deposit, at the rate of $20.67 per fine ounce. If the bullion is not of desired fineness, and requires parting and refining, a charge is made for the operation, and in addition an alloy charge for the necessary amount of copper to bring it to a standard of 900 fine.

With this review of the conditions upon which gold bullion may be deposited, or sold to the principal mints of the world, it will be readily seen that there is little inducement for the actual miner or producer of gold to take his product direct to the mints, and as a matter of fact, with the exception of small quantities at times brought direct to the assay offices of the United States in the western states, the gold received at the mints usually comes from refining companies through the hands of bankers and brokers. The man who possesses gold in a crude state rarely has it at the desired degree of fineness demanded by the mints. He, therefore, except in the United States, must go to a refining company where he usually sells outright at a somewhat lower figure than the mint rate, instead of employing the company to do the work on his account. The refining company turns out the gold in stamped ingots of standard fineness, and again passes over the commodity into the hands of bankers or brokers at a small discount rather than comply with mint regulations and lose interest on capital invested while awaiting the return. In the United States, however, where the return is immediately made, much more gold proportionally is deposited directly by refining companies than by bankers and brokers. However, it matters not through whose hands gold bullion may pass, or what road it may travel, there remains a remarkable economic phenomenon, not to be found in the case of any other commodity. There is always an open market or recipient, absolutely bound by law to accept this commodity in unlimited quantities at a known, and fixed, mint value or price; for value and price are here the same, there being no room for the subjective or time elements to enter in except in so far as the national laws of the different countries might be changed. If a man parts with his gold to any one else, or uses it for commercial or industrial purposes rather than take it to the mints, it is because his return is equal to the known mint rate, or because the difference is, in his eyes, equivalent to complying with some of the minor conditions, such as transporting the product to a mint receiving office, or waiting for his money return. Thus also, to whatever use gold may be put, its value can but slightly vary from that stated by law by the principal commercial nations of the world.

GOLD, DISCOVERIES OF. See PRECIOUS METALS, DISCOVERIES OF.

GOLD, DISTRIBUTION AND PRODUCTION OF. The economic distribution of gold as a medium of exchange is widely different from its geographical distribution as a metal. The United States of America, the United Kingdom, France, Germany, and the western countries of Europe generally, use the largest quantities of gold either for coinage or ornament. The United States are only in part an exception to the statement, as the gold-using states are not the gold-bearing states. Gold is to be found in small quantities in almost every country of the world. In the early ages of the world it probably came mostly from the East,—very likely from the present mines of India: it was next discovered in considerable quantities in South America; then at the beginning of this century in Siberia, in 1847 in California, and in 1851 in Australia. The rediscovery of the Indian mines, and the opening of those in Queensland, were important factors in the production of recent years, but hardly amount to the addition of a fresh area: British Guiana is in the same category; the recently-opened goldfields of South Africa and Canada have added to the known supply.

In 1903, according to tables compiled from U.S.A. mint reports (see *Statesman's Year Book* 1905), the yield of the different areas in order of fertility was as follows:

	Tons.	£ Mill.
Australia	160·54	*17·8*
United States	132·44	*14·7*
Africa	122·37	*13·6*
Russia	44·32	*4·9*
Canada	33·89	*3·8*
	493·56	*54·8*
From all other sources	92·22	*10·3*

The five areas enumerated now provide about five-sixths of the world's annual consumption of gold. South America, once the leading source of supply, is at present quite a minor area; the yield from South Africa increases.

Respecting the amount produced in the past, computations have been made by Dr. Soetbeer which are probably as trustworthy as any such figures can be. He places the production of gold "up to 1600" at 750 tons, and up to 1880 at 10,355 tons, and the stock of gold in the world in 1880 as 9500 tons. But Soetbeer's figures give the total production between 1493 (when America had been discovered) and 1600 as over 745 tons, and there must have been a considerable stock previous to this. The following table exhibits the increase of production of gold.

Annual Average.	Tons.	£ Mill.
1493-1520	5·80	·74
1601-1620	8·39	1·06
1701-1720	12·62	1·60
1801-1810	17·50	2·22
1841-1850	53·89	6·83
1851-1855	194·39	24·64
1856-1860	202·80	25·71
1861-1865	182·20	23·10
1866-1870	188·87	23·95
1871-1875	167·98	21·29
1876-1880	169·69	21·51
1881-1885	152·52	19·33
1886-1890	167	21·17
1891-1895	293·21	32·58
1896-1900	463·05	51·46
1901-1903	530·64	58·97

The annual averages fluctuate considerably. After 1830, when the Russian supply became important, the production increased nearly 50 per cent. In the ten years after 1840 it increased more than threefold: in the next decade, when California and Australia had been opened up, it had been increased again fourfold. There was a tendency in the supply to fall off steadily from that time for more than thirty years; but lately it has again been increased. The output for 1891, over 183 tons, was about equal to that of 1861, and it has since steadily increased to being, in 1903, over 585 tons. As further discoveries are being made in New South Wales, Western Australia, and British Guiana, the supply is not likely to diminish at present. The average annual production since 1848 has probably not been far short of one-tenth of the total production of gold in the preceding 350 years taken together.

Another interesting feature in the production of gold is the comparative fertility of the different areas of supply. Mulhall, taking 500 years to 1880, assigns 21·5 per cent of the total product to Spanish America, 19·7 to the United States, and 17·8 to Australia. But each year alters those proportions, and in 1903 about 23 per cent came from the United States, 27 per cent from Australia, 7 per cent from Russia, over 20 per cent from Africa, as will be seen by the table above.

[The First Report of the Gold and Silver Commission, C. 5099, 1887, quotes Soetbeer's table, and contains the evidence of Mr. Inglis Palgrave and Sir. R. Giffen. The figures for Australia can be found carefully collected in the *Victorian Year-Book* for 1892, pp. 333 *seq.*—Suess, *Zukunft des Goldes* and *Zukunft des Silbers.*] C. A. H.

GOLD AND SILVER WARE. (See HALL MARKING.)

GOLD CERTIFICATES. Twice in recent history the issue of gold certificates has been authorised in the United States. Power was given to the treasury department under the act of 3rd March 1863. They were discontinued by act of 1st December 1878, but again authorised 12th July 1882. These certificates are issued against deposits of gold in denominations of not less than $20 each, and are designed especially for use as bank reserves, and the settlement of clearing-house balances. The issue of these certificates is suspended whenever the gold in the treasury falls below $100,000,000.

[*Finance Report of the United States* for 1882, p. 171.—Compare Blue Book, *Committee on Indian Currency* (Gairdner's Evidence).—C. F. Dunbar, *Chapters on the Theory and History of Banking*, 1891.] D. R. D.

GOLD MINING ROYALTIES. (See ROYALTY.)

GOLD NOTES. On account of the popular prejudice in California to paper money of any kind, banks were permitted to be organised in the United States by the act of 12th July 1870, under the national banking law whose issues were to be redeemed in gold coin alone instead of in legal tender which included greenbacks and silver. In all other principal points, however, these institutions were similar to the national banks found throughout the United States. These banks, of which there were never many, were known as gold banks. By the act of 14th February 1880 authority was given to convert these institutions into national banks of the usual form.

[*Finance Report of the United States*, for 1875, p. 219; also for 1877, p. 155.] D. R. D.

GOLD POINTS IN FOREIGN EXCHANGES. The rates of exchange quoted between any two countries are for drafts or bills of exchange, and the price includes, besides the actual equivalent of the standard coin (*a*), some allowance for interest, according to the tenor of the draft, and (*b*) a premium which the seller demands for the economy and superior convenience of his draft, as compared with a remittance in bullion. This premium is greater or less, conversely to the amount of drafts in the market as compared with the demand for them, but it cannot, in any case, rise much above the cost of remitting coin, nor can it at all exceed that amount for any considerable time. The cost of remitting gold between London and Paris is somewhere about one-half per cent, or 4 per mille, Berlin about 5 per mille, and New York about 5 per mille. Therefore by

adding or deducting this rate to or from the MINT PAR (*q.v.*), we have a rate which is called the "gold point," or "bullion point," and at which bullion will be remitted one way or the other. The gold points on the London exchange with some of the principal countries are (1906)—

London on	Mint Par.	Gold Exports.	Gold Imports.
Paris . .	Fcs. 25·22½	25·12½	25·32½
Berlin . .	Mks. 20·43	20·33	20·52
Amsterdam .	Fl. . 12·10	12·04	12·15
Copenhagen .	Kr. 18·16	18·07	18·23
New York .	$. 4·827	4·867	4·89

These are the rates at which bullion remittances become generally profitable, but, as a matter of fact, gold movements begin before these points are reached, as some business houses with special facilities, or undertaking large transactions, find a profit in remitting gold at much closer rates.

In comparing these with current quotations, regard should be had to the other factor (*a*) referred to above—the allowance for interest. On the London exchange, rates, as usually given, are for three months' or ninety days' drafts, the only exchanges quoted "short" being those with Paris, Amsterdam, New York, and Calcutta.

Care must also be taken to distinguish between rates quoted in foreign money and those quoted in sterling. With France, Belgium, Italy, Germany, Austria, Holland, and the Scandinavian Union, exchanges are quoted in foreign money, at so many francs, marks, florins, etc., to the pound sterling; and, in these cases, the *higher* the quotation the more favourable it is to this country—*i.e.* the greater the amount of foreign money we have to receive. The *lower* gold point is that at which bullion will leave this country. With Spain, Portugal, Russia, India, and China, exchanges are quoted in sterling, at so many pence per dollar, milreis, rouble, or rupee, and the *lower* the quotation the more favourable it is to this country, whilst the *upper* gold point will mark bullion exports.

At some times and places, where a gold standard nominally exists, and the currency consists of inconvertible paper and of subsidiary coinage that is useless for export, the movements of the exchanges are independent of the "gold points," or, it should rather be said that new and fluctuating gold points are set up, governed by the cost of obtaining gold as well as of remitting it. R. W. B.

GOLD, QUEEN. See QUEEN GOLD.

GOLDSMITHS; GOLDSMITHS' NOTES. The date (namely about 1645) at which English goldsmiths extended their operations, from trading in money and the precious metals to a regular system of private banking, can be approximately fixed through a pamphlet entitled *The Mystery of the Newfashioned Goldsmiths or Bankers discovered* (London, 1676). This pamphlet informs us that the goldsmiths had extended their previous business to lending money and to most of the operations of modern banking, their largest advances being made to the king upon the security of the taxes. The goldsmiths allowed interest to those who placed money with them, and the receipts which they gave for these deposits passed from hand to hand as currency in much the same manner as Bank of England notes do now. That this business soon grew considerably is evident from the testimony of Sir Dudley NORTH in 1680, who, on returning from abroad after many years, was greatly astonished at the new practice of merchants and others making payments by drawing bills on bankers, *i.e.* goldsmiths. Hence it will be seen that the goldsmiths, from the middle of the 17th century onwards, assisted greatly to accustom people to the use of a paper currency. As instances of this it may be cited that the Long Parliament in 1649 agreed to accept Goldsmiths' Hall bills, as well as ready money, in payment for the bishops' lands (Scobell's *Acts*, ii. 86); and that in 1696 during the recoinage "all great dealings were transacted by tallies, bank bills, and goldsmiths' notes" (Davenant, *Discourses*, ii. 161). The English goldsmiths of the 17th century in issuing their notes acted on quite a different principle from the continental banks of that date. Most of the continental banks, for example the BANK OF AMSTERDAM (*q.v.*), professed to be merely banks of deposit of coin or bullion, and to hold in this form the full value of the bills issued against these deposits. Our goldsmiths, and the Bank of England following them, purported to give in their bills the equivalent of what they had received, but never pretended to take the deposit for any other purpose than that of trading with it. They did not make their issues square exactly with the deposits of coin and bullion entrusted to them, "but coined their own credit into money." This resulted occasionally in difficulties. The first recorded run on the private banks, or goldsmiths, was in 1667 after the disastrous defeat suffered by the English fleet at the hands of the Dutch at Chatham. Then the stoppage of the exchequer in 1672 seriously affected their credit; even their honesty was impugned; and in course of time it was found that paper money issued on the security of a small number of individuals, could not circulate profitably in competition with that of a powerful joint-stock corporation, such as the Bank of England became in spite of the goldsmith's opposition.

[The most interesting information as to the general banking business of goldsmiths is given in

the pamphlet of 1676 already mentioned (London, 4to, 8 pp.), which is quoted with additional remarks by Anderson, *Chron. Deduct. of Commerce*, year 1645. Also another pamphlet, *England's Glory in the Great Improvement by Banking and Trade*, London, 1694.—W. Cunningham, *Growth of English Industry and Commerce*, ii. 105, 222, 224.—Thorold Rogers, *First Nine Years of the Bank of England*, pp. 6, 21, 70.—Macaulay, *Hist. of England*, ch. xx.—Davenant, *Discourses on the Public Revenues and Trade of England* (1698), i. 265, and ii. 161.—*Mystery of the New-Fashioned Goldsmiths or Bankers Discovered*, 1676, reprinted in *Quart. Journ. of Economics*, Boston, Jan., 1888.] H. de B. G.

GOOD. This word forms a term sometimes used in the British colonies for a paper acknowledgment of a debt—something of the nature of an I.O.U. We have met several instances of such acknowledgments being deposited in cases of unauthorised borrowing from funds under the control of the borrower.

But the most distinctive use of the word was to denote government notes in British Guiana: it takes the form "good-for" in the currency history of the Cape Colony. In the case of Berbice in 1800 and 1809 the Court of Policy issued these notes of various amounts in guilders. Similarly in 1806 in Demerara "goods" secured on the colonial revenue were made a legal tender, and those of private persons competed with them in circulation. In the Cape the term "good-for" was confined apparently to the private note which competed with government paper up to the year 1822. Compare French *Bon, Bon pour*, etc.

[Chalmers's *History of Currency in the Colonies*, *s.v.*] C. A. H.

GOOD DELIVERY. An expression used on the stock exchange. A stock exchange security is not a "good delivery" if it has any defects on its face, *e.g.* mutilation, absence of the proper coupons or of any necessary revenue stamps, irregularity in the number; the name of the owner written on the document when payable only to bearer, etc., and in such a case a purchaser is entitled to refuse acceptance. In cases of dispute the decision of the committee of the stock exchange is conclusive. E. S.

GOOD-FOR. See Good.

GOOD FOR TRADE. "It is good for trade" is a very common popular answer to any condemnation of wasteful consumption or extravagant expenditure. That consumption, whether extravagant or not, of the produce of any particular trade is profitable to the persons actually engaged in that trade is obvious; no one doubts for instance that to break a window is good for the trade of the glaziers. It is hastily inferred from this that extravagant consumption is "good for trade" in general, or profitable to the whole body of producers. But so long as the amount of labour performed and its productiveness remain unchanged, an increased consumption of one sort of produce must be accompanied either by a decreased consumption of another sort of produce or by a decrease of savings. Consequently the expenditure which is "good" for one trade is equally bad for other trades. Whether the extra consumption of one kind of produce is made up for by a less consumption of other kinds or by a decrease of savings makes no difference. Diminished saving is just as "bad" for some trades as diminished consumption is for others; saving is "good" for the trade of all those who produce the kind of commodities which are saved and added to the capital of the country, *e.g.* machinery, factories, railways, ships, and houses. That unusual expenditure in one direction only benefits one set of trades at the expense of others was clearly recognised by many traders after the jubilee rejoicings in 1887, when they found that the extra consumption of the products of other trades was being compensated for by a diminished consumption of the products of their own.

GOODS AND CHATTELS. An ambiguous expression like the word Effects (*q.v.*) which, if used in a will, is generally construed as including the testator's whole personal estate unless the context requires a more restricted meaning. E. S.

GOODS OF THE FIRST ORDER; GOODS OF THE SECOND ORDER. See Production, Instruments of.

GOODS, CLASSIFICATION OF.

(1) Material Goods and Personal Goods, p. 229; (2) Durable Goods (Accumulable or Potential) and Transient Goods (Unaccumulable or Actual), p. 229; (3) Consumption Goods and Production Goods, p. 229; (4) Gratuitous Goods (or Natural) and Onerous Goods (or Acquired), p. 229; (5) Appropriable Goods and Unappropriable Goods, p. 229; (6) Transferable Goods and Non-Transferable Goods, p. 230.

The term goods has been used in a very general sense to denote any object of human desire. One of the purposes of a classification of goods is to provide the data for determining a definition of wealth adapted to economic science. But as hardly any of the objects of human pursuit are without some bearing on the science, there is a more important use in classifying them; namely, to bring out the different relations in which these various objects stand to economic activities. For this purpose it is necessary to consider such distinctions as are important in each of the different branches of the science. Accordingly, goods may be classified (1) from a general point of view; (2) from the point of view of production and consumption; (3) from the point of view of distribution and exchange. Under (1) goods may be divided into material and personal, and into durable and transient; under (2) into consumption

goods and production goods, and into gratuitous goods and onerous goods; under (3) into appropriable and un-appropriable, and into transferable and non-transferable.

1. *Material* goods and *personal* goods.

Material goods are those that depend on the properties and positions of material objects, not including human beings (*e.g.* food, climate, shelter provided by houses, transport of commodities). Personal goods consist of (i) attributes of individual persons (*e.g.* strength, knowledge, skill, a good conscience); (ii) relations between persons (*e.g.* social organisations, the esteem or trust felt by one person for another); and (iii) those benefits conferred by persons on themselves or others which do not involve any palpable change in the properties or positions of material bodies (*e.g.* advice, entertainment, protection, instruction). The act of rendering a utility to a person is called a *service*: a service is material so far as it effects an alteration in material things (*e.g.* cooking of food, cleaning and repairing household goods); while a service is personal which creates a personal utility (*e.g.* advice, instruction). The services of domestic servants are partly personal and partly material.

2. *Durable* (accumulable or potential) goods and *transient* (unaccumulable or actual) goods.

Durable goods are those which, being comparatively permanent, are capable of affording utility or a series of utilities at some future time; while transient goods are the actually realised utilities themselves. Among durable material goods are to be included houses and machines; and among durable personal goods, abilities and knowledge. Transient material goods would include warmth from fires; and transient personal goods would include professional advice and hearing of lectures. Durable goods may generally be regarded as the *potential* sources of *actual* or transient goods. But it is obvious that most of the things that are distinguished as transient goods (*e.g.* instruction) may produce more or less *durable* results; and, on the other hand, that durable goods (*e.g.* coal and food which are destroyed in use) may produce more or less *transient* results.

3. *Consumption* goods and *production* goods.

Man can create or destroy only utilities, not matter. The ultimate object of all economic activity is what may be called the *enjoyment* of utilities. On the other hand, some *sacrifice* of utility in the form of labour or effort is in general a necessary condition for creating utilities. Hence economic science has to take note of two antitheses: viz. (1) between the *destruction* and the *creation* of utilities; (2) between the *enjoyment* and the *sacrifice* of utility. The terms consumption and production would naturally be used to indicate the former antithesis; but, as a matter of fact, they have come to be used with more special reference to the latter. In other words, consumption implies *enjoyment*, whether this is or is not attended by the destruction of utility; and production implies the *sacrifice* of utility, provided this is undergone with the purpose of creating utility. Hence we have the following important division of goods into consumption goods and production goods. Consumption goods (*i.e.* enjoyment goods) are those which, being in the hands of the person destined to enjoy them, can be directly utilised for enjoyment without further expenditure of labour. Production goods, or auxiliary goods, are the unfinished products or instruments intended to be employed in aid of labour which can only be utilised by further expenditure of labour. According to these definitions, commodities in the hands of dealers, though otherwise completely adapted for direct enjoyment, are to be classed as production goods, because they are not in the hands of those destined to enjoy them, and, moreover, are only to be utilised by the labour of shop-attendants, errand boys, etc. On the other hand, a house of residence, even though occupied by some one other than the proprietor, is to be called a consumption good. Of course any durable consumption good is productive in the sense of affording, from time to time, many utilities; and, on this account, such durable consumption goods have been called "consumers' capital." But since the utilities afforded by a place of residence, for example, are direct and not indirect, it is called a consumption good, though in order to preserve its capacity for yielding utilities, it may require repairs and cleaning from time to time. Consumption goods are also called *goods of the first order*; while *goods of the second order* are those used for the direct production of goods of the first order, and so on. These distinctions are, however, not easily applicable (see PRODUCTION, INSTRUMENTS OF).

4. *Gratuitous* (or natural) goods and *onerous* (or acquired) goods.

Goods have also been distinguished according as their capacity to yield utilities is or is not due to human effort. The latter, being gifts of nature, have been called gratuitous; and the former, being acquired by labour, have been called onerous. Thus Ricardo speaks of "the original and indestructible powers of the soil." But it is obviously not easy to draw the line between what is in this sense original and what is due to labour and industrial organisation. For many purposes it would be more convenient to distinguish as gratuitous those goods which have been handed down to the present industrial generation without effort on their part, *e.g.* permanent properties of the soil and inherited personal aptitudes. But in any case the distinction would be difficult to apply with any exactness.

5. *Appropriable* goods and *unappropriable* goods.

In using the term appropriable, it should be explained that what is appropriated in any case is the *opportunity* of benefiting from goods; and this opportunity may or may not be secured by legal authority. Appropriation implies some *limitation* of opportunity; *i.e.* while a single individual or a set of individuals can enjoy the opportunity, others are excluded from it. Possession by an entire political community would, however, not generally be called appropriation. In this sense, such material goods as climate and air, and such personal goods as political and industrial

organisations, may be classed as unappropriable. Some appropriable goods (*e.g.* public roads and buildings, rivers and seas, commons, etc.) are actually unappropriated. Hence among appropriable goods we must make a further subdivision into appropriated and unappropriated.

6. *Transferable* goods and *non-transferable* goods.

Appropriable goods have further to be subdivided into *transferable* and *non-transferable*. The means and limits of transferability depend on legal as well as physical conditions. If one person A is in a position to choose whether he shall confer a benefit on B or on C, such a service may be called *transferable*, whether the transference is effected by contract between A and B or between B and C. Non-transferable appropriated goods are either material (*e.g.* opportunities of using public property or natural gifts) or personal (*e.g.* personal attributes, relations of esteem or trust, titles, honours, and other privileges). Transferable appropriated goods are also either material (*e.g.* opportunities of using goods in perpetuity or temporarily) or personal (*e.g.* benefits directly conferred by one man on another).

[Marshall's *Principles of Economics*, 2nd ed. bk. ii. ch. ii. iii. iv.—Sidgwick's *Principles of Political Economy*, bk. i. ch. iii. iv. v. These two works are specially instructive in regard to economic distinctions of goods. In addition should be mentioned the economic works of J. S. Mill, Senior, Hermann, Bastiat, Wagner, and Nicholson.] W. E. J.

GOODS, Economic. In English the singular noun Good is usually abstract and psychical; it is usefulness, benefit, or blessing. But by the plural (Goods) is denoted concrete embodiments of usefulness, in short, "commodities" (see Commodity), the singular of which word is employed by economists to represent the missing singular of "goods."

As political economy is usually defined by its relation to wealth, and as wealth is defined as a sum of goods, it is clear that the precise definition and the classification of goods are matters of great theoretical importance. The discussions, growing no doubt out of the remarks of Adam Smith on the physiocrats, between Malthus, Ricardo, James Mill, Bailey, Say, and others on the proper line of distinction between productive and unproductive labour, took in later times the form of a debate on the propriety of including "immaterial goods," services, and legal rights among economic goods. The simplest and most intelligible definition of a commodity, a material means, not unlimited in supply, of satisfying human wants, excludes too much; and there is general assent only to the element of limitation, as it seems obvious that goods of which no "economy" is needed are not economic goods.

To consider this question would be in reality to write a treatise on the whole theory of the fundamental notions of political economy, and it will be enough to refer to the authorities below.

[Marshall, *Principles of Economics*, bk. ii. ch. ii. 1890.—Hermann, F. B. W., *Staatswirthschaftliche Untersuchungen*, 1832, ch. iii.; *Die Güter.*—Schäffle, A., *Mensch und Gut*, 1861.—Wagner, A., *Allgem. B., *Cours complet d'écon. pol.*, 2nd ed., 1840, pt. i. p. 31, ch. i.; *De nos besoins et de nos biens.*] J. B.

GOODWILL,—the expectancy of a continuance, to the advantage of a successor in an established business, of the personal confidence, or of the habit of recurring to the place or premises or to the known business house or firm, on the part of a circle or connection of clients or customers. This expectancy is found to have a marketable value, and may arise from, or be raised in value by, several circumstances, such as the acquisition by the assignee of the sole ownership of the premises in which the old business had been carried on, the assignation to him of existing stipulations in behalf of the vendor, or agreement on the part of the vendor to recommend his successor or to abstain from competition with him. But goodwill in the legal sense, "goodwill without more," or goodwill in the sense of the bankruptcy acts, is restricted to such rights as may pass at law by an assignment of the goodwill without any special stipulation. Under this head will fall the exclusive rights to carry on the old business and to represent that it is the old business which is being carried on, which carry with them the exclusive right to the trade name—if the use of it be not likely to mislead, or be not so used as to mislead the public into a belief that it is the same person who carries on the business or that any of the old members are still in the business—to the trade marks, and any restrictions on others in favour of the business, so long as these are not merely personal, in favour of the original trader. Transfer of the goodwill in the absence of express stipulations leaves the original trader in the same position as any member of the public, free, so long as he does not profess to carry on the old business, to set up a business similar to the one sold, in his own name, where he likes and as he likes, to compete and to solicit old customers publicly or privately, and to represent that he had been a member of the old firm. Goodwill may be voluntarily assigned *inter vivos* as well as bequeathed by will; it is also liable to involuntary alienation upon bankruptcy or insolvency. Where compensation is paid for compulsory purchase of business premises under railway acts and the like, the compensation includes not only the value of the premises, but also as a general rule a sum representing the Goodwill.

[Charles E. Allan, *The Law relating to Goodwill*, London, Stevens and Sons, 1889. Compare Schäffle, *Ausschliessende Rechte;* Böhm Bawerk, *Rechte und Verhältnisse.*] A. D.

GOOGE, BARNABY (1540-1594), published *Foure Bookes of Husbandry, collected by M. Conradus Heresbachius, Councellour to the high and mightie Prince, the Duke of Cleve*, etc., newly Englished and encreased by Barnaby Googe, Esq., London, 1577, 4to. This work was in the main a translation of Heresbachius's *Rei Rusticæ libri quatuor*, etc., Colon, 1570, 8vo; Spiræ, 1595, 8vo; Heidelb., 1603, 8vo. Editions of Googe's work were published in 1578, 1586, 1596, 1601, and 1614, and it became the basis of *The Whole Art of Husbandry in foure bookes*, etc., by Captain Gervase Markham, London, 1631, 4to.

[See notice of Googe, *Dictionary of National Biography*, vol. xxii.] W. A. S. H.

GOSSEN, HERMANN HEINRICH (1810-1858), was born at Düren, then a French village. His father and grandfather were government officials, and he followed the same career, with a want of success which is attributed to his predilection for abstract studies. He is described as amiable and unpractical. He retired into private life 1847; occupying himself first with a project of universal insurance, afterwards with his book entitled *Entwickelung der Gesetze des menschlichen Verkehrs und der daraus flies-senden Regeln für menschliches Handeln*, which was published at Brunswick in 1854.

This work, which had been generally overlooked even in Germany, and is not mentioned in Roscher's History, was brought to light by Professor Adamson, and an account of it was given by Jevons in the preface to the 2nd edition of his *Theory of Political Economy*. It was extremely rare; there probably did not exist a copy in England except one in the library of the British Museum. It was reprinted at Berlin, Prager, in 1889. The work is an attempt to found economics on a mathematical basis, and the author regarded his services in the reform of the method of the science as similar to those of Copernicus in astronomy. We are told by Jevons that Gossen, who had been entirely unknown to him, had "completely anticipated him as regards the general principles and method of the theory of economics," but had been unfortunate in his development of that theory. J. K. I.

Gossen's book contains two elements of unequal value: a somewhat narrow and pedantic application of utilitarian philosophy to politics and ethics, and a very original formulation of the principle of final utility in economics. He starts from the epicurean or utilitarian first principle, "Man wishes to enjoy his life and makes it the aim of his life to raise the enjoyment of his life to the highest possible degree." Gossen maintains in the spirit of Bentham that the object of all men is to obtain the greatest sum of pleasure; in the spirit of Butler that, because this purpose is universal, it must be the design of the Creator. The true revelation given by the Creator is the command, "Man discover the laws of my creation and act according to those laws."

In obedience to this precept we have to investigate the laws of pleasure. They are two. (1) The magnitude of a pleasure continually diminishes up to the point of satiety, the longer we apply a stimulus or pleasure-giving object of constant quantity without cessation (*wenn wir mit Bereitung des Genusses ununterbrochen fortfahren*). (2) There occurs a similar diminution of the pleasure when we repeat the conditions of a pleasure enjoyed before. The initial magnitude of pleasure is less, and the period of enjoyment up to the moment of satiety is shorter.

These laws of our sentient nature are illustrated by diagrams closely resembling those which Jevons independently constructed, except that Gossen prefers to use the simplest form of "curve," viz. the right line. Thus, in the accompanying figure, time is represented by the abscissa (*e.g.* *ad*), and the corresponding magnitude of pleasure by the corresponding ordinate (*de*).

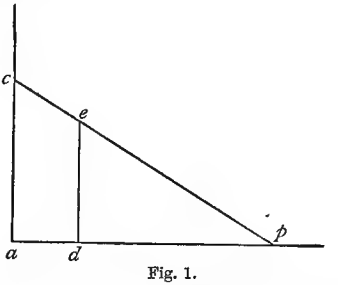

Fig. 1.

The geometrical representation of psychical quantities is defended by the analogy of astronomy, in which science we compute distances of which the direct measurement is impossible. This exaggerated estimate of the mathematical method should be compared with the remarks in the Preface; where Gossen compares his work to that of Copernicus.

Gossen goes on to consider the most advantageous method of employing a given time upon different kinds of enjoyment. He finds that it will be best to leave off each pleasure at a point such that the terminal magnitude of pleasure is the same for each species of enjoyment. This simple principle is worked out by Gossen in considerable detail. Assuming for the sake of illustration the relation between utility and time to be of the simplest, the *linear*, species, he assigns actual numbers, and constructs an imaginary table for the best

employment of a given time (pp. 17-20). He may seem somewhat deficient in the quality of mathematical elegance.

To carry out the purpose of our life we require a knowledge, not only of the laws of pleasure which have been enunciated, but also of the outer world in its relation to our happiness (p. 23). From this point of view there is presented a threefold division of goods (pp. 25-27). The first class denotes articles ready for consumption, *e.g.* an apple, or a coat. The second class denotes materials which require to be worked up before they take a place in the first class, *e.g.* wheat and cloth; also such articles as a pipe, useless without tobacco, a stove, without coal. A third class denotes objects which are altogether of the nature of means; such as fuel used for machines, everything used for production which does not subsist and enure in the finished product.

The law of diminishing utility which was first enounced with respect to time becomes applicable to commodities, primarily those of the first class, and indirectly also those of the second and third classes—if we take quantity of commodity as the independent variable or abscissa, as in the diagram above; the dependent variable or ordinate being, as before, magnitude of pleasure.

We have next to take into account the labour required to produce goods. Gossen's theory of labour is equivalent to that of Jevons, but worked out in greater detail. If, in the

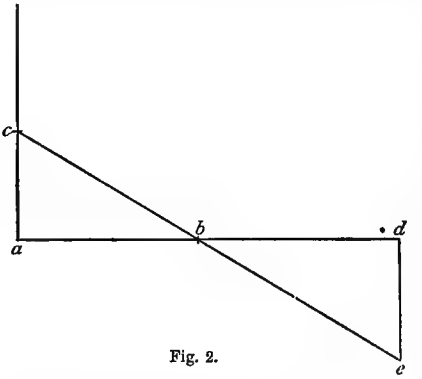

Fig. 2.

accompanying figure (Fig. 2), the abscissa *ad* represents the time during which force is uniformly put forth, the ordinates represent the corresponding utility, beginning with positive pleasure and descending to the pain of fatigue. The same figure serves to illustrate the relation between the quantity produced and the pleasures or pains of production; provided that a constant number of days, or hours, of work goes to a unit of product. But this identity is destroyed, and an additional figure is required when there is a change in what Gossen calls "skill" (*Geschicklichkeit*) or productivity of labour (pp. 40, 42, etc.). The relation between this "skill" and another coefficient described as "capacity for work" (*Arbeitskraft*) forms a nice question of interpretation (cp. pp. 40-42, 48, 53, 58, 64, 73, 108).

The separate representations of the feelings attending production and consumption are ingeniously combined by Gossen. He superposes on the pleasure of consumption the pleasure or pain of work by *reversing* the figure proper to the latter (our Fig. 2); laying down the positive ordinates underneath, not above, the abscissa. The ordinates of the curve *ce* in our Fig. 3 (*Gossen*, p. 39) represent as before pleasure in the way of consumption. The

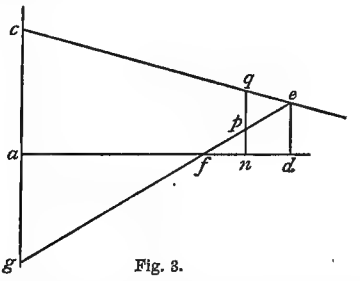

Fig. 3.

ordinates of the curve *ge measured downwards* now represent the pleasure of labour. Thus *ag* is the positive pleasure of production at an initial stage. At the point *f* there is neither pain nor pleasure. To the objective quantity *an* corresponds the negative pleasure, the pain of labour *np*. Hence the total satisfaction derived from *an* is represented by the figure *gegp*. This area is a maximum when the abscissa is *ad*.

This illustration relates primarily to a single product. But it may be extended to illustrate the most advantageous distribution of labour over a variety of employments, the ordinate representing no longer the utility derived from a single source, but from a whole set of objects, in the proportions prescribed by the theory of final utility.

This theory of economic equilibrium, as we might call it, is worked out in immense detail (pp. 40-80). Conclusions tolerably obvious to common sense are enounced with respect to a great number of supposed cases; the enhancement of an existing pleasure (higher pleasure corresponding to the same amount of means), the addition of a new pleasure, either requiring no exertion or derived from labour, a change in "skill," or in "capacity for work," and so forth. Gossen illustrates the conclusions by numerical examples with his usual exhaustiveness.

So far we have investigated the laws according to which the solitary economic man would

regulate his work and pleasures. But in a regime of division of labour there arises the need of exchange. Gossen employs curves of the sort represented in our Fig. 1 in the exposition of a theory of exchange which bears comparison with the constructions of the mathematical economists who have succeeded him. He prettily illustrates the advantages of exchange by the case of two children, one of whom has more bread and butter, the other more milk than he wants (p. 80). Observing that the sum total of utility will vary according to the terms of the exchange, he is led to investigate the arrangement which is productive of "greatest happiness," of which the condition is that the final utility due to the last increment of a commodity should be the same for all persons; a proportion which is extended so as to apply to the distribution of labour as well as commodities. This utilitarian distribution, according to which "each obtains the amount which he can justly claim," tends to be realised in virtue of the correspondence between private and public interest. This sort of "harmony" has not been described more extravagantly by Bastiat (90-100). The realisation of the true paradise is the removal of hindrances to the free play of self-interest.

Before showing how these hindrances are to be removed, Gossen prefixes several miscellaneous theories, some of which may be noticed in the order in which they occur—not a very lucid order.

The theory of rent is investigated by Gossen in some not very inviting symbols. The effects produced on rent by the addition of a pleasure requiring no exertion, by the increase of "skill," and other changes above adverted to, are formulated with characteristic elaborateness (pp. 103-114).

A consideration of the future value of rent leads to a theory of capitalisation, which has some affinities to those which have been propounded by Jevons and by Professor Marshall (pp. 114-118).

Gossen next inquires what are the independent variables, the determining factors of, as we should say, economic equilibrium. His fourfold division of the ultimate elements deserves attention (pp. 120-121).

The next subject which comes up is the measurement of pleasure. Gossen is as sanguine as Jevons about the possibility of constructing demand-curves. He thinks that the mean results thus obtained might serve as a guide to the individual in his efforts to maximise his own pleasure (p. 127).

Among the miscellaneous remarks which follow may be noticed a distinction between necessaries and luxuries: with a fall in price the total expenditure on a necessary decreases, —on a luxury, increases (p. 133 *et seq.*).

Gossen occupies some pages with "verifications," among which he places the proposition that rent does not depend on cost of production. There follows an extensive series of commonplaces (p. 148 *et seq.*) under the head "errors of statesmen and economists."

The "errors" of the moralists are more piquant. Gossen complains that they have disparaged the principle of self-interest. Failing to perceive that "the creation is perfect," they have neglected the motive-power provided by the Creator for his machine. The true religion of the Creator aims at maximising the sum of happiness on the earth. The priests of the true religion are scientific discoverers; its sacraments physical and chemical experiments.

The pedagogues are next arraigned for stereotyping the system of classical education (p. 190).

It remains only to show how to remove the impediments which prevent the law of pleasure being carried out, and earth being turned into a paradise. The "impediments in man himself" are to be removed by a perfect education, of which Gossen prescribes the model. Among artificial or external hindrances is a bad currency, a subject on which Gossen has much to say. He recommends that the state should guarantee the fineness only, not the weight, of the coinage. He disapproves of a legalised rate between gold and silver, speaking with reference to a single state.

Freedom from hindrance does not imply abolition of property (p. 228). But the action of the state must be kept at a minimum. The true church, which is the school, would require no protection.

A system of state-credit or national loan-fund (pp. 239-250), and the nationalisation of land (p. 250), are also recommended.

In conclusion (p. 273) Gossen dwells on the benefits to be expected from the adoption of his recommendations: "*Nothing more is wanted to make earth a paradise*" (italicised in the original).

These speculations appear to be, as Jevons says, of inferior merit. Gossen is guilty of a fallacy to which mathematical economists are peculiarly liable: what may be called the "illicit process" from the principle of utility in economics to utilitarianism in the philosophy of conduct. The logical error is aggravated in the case of Gossen by a certain pedantry and want of humour. His strength lay only in the more mechanical portions of the mathematical theory. He was a man of one idea; but that was an immortal one.

[Preface to the second edition of Jevons's *Theory of Political Economy*, 1879.—*Journal des Économistes*, 4th series, vol. xxx., 1885, p. 68.—*Un Économiste Inconnu*, by Prof. Léon Walras; containing a biographical notice supplied by Gossen's nephew.] F. Y. E.

GOTHENBURG SYSTEM, THE. Spirits are now sold in Sweden, largely also in Norway and Finland, under the "Gothenburg System." From the beginning of the century, the right of distilling brandy had been so identified with land cultivation that a sort of monopoly of a very deadly kind came into existence. Until 1824 there was "unchecked distillation for use of the household." This turned every peasant's home into a centre for the widest and easiest distribution of a very powerful liquor. The results of this "freedom of a necessary industry" were such as to create alarm in every class. In 1830 the long struggle began which resulted in the famous law of January 1855, by which this free household distillation was practically checked. The minimum quantity to be distilled daily at an authorised still must be 300 kans. (The kan = ·5756 gall.) Legal, medical, clerical officials were prohibited from having any advantageous connection with the manufacture, and to the community was given the right to forbid non-licensed traffic in retail form. No liquor legislation ever had greater or more instant effect. In 1853 between 33,000 and 34,000 distilleries were producing above 35 millions of "kans." In 1855 the stills had been reduced to 3481, with a production of less than 10 millions of kans. Further enactments made debts incurred for brandy not recoverable by law, forbade "drinking on credit," etc. Almost every separate provision of the "Gothenburg System" is here *except one*. Each year's reports from country and town made it clearer that the essential parts of this new legislation could be defeated so long as the sale was controlled by private individuals whose profits depended upon the widest possible distribution of brandy. The Gothenburg System meets this difficulty by giving the entire control into the hands of a company that makes no profit from the sales. In October 1865 the first company began its work. The fact that all gains from liquor sales were taken from the private individual and given to the community enabled the authorities to carry out the previous provisions of the law. Sales on credit or for pawn were stopped. Sales on Sundays and holidays were forbidden, also to youths. Food, and a variety of wholesome drinks upon which the seller *can* make profit, must be on hand. The express motive of this legislation to use the profits for the public good is shown in the erection of reading-rooms and coffee-houses in which latter not even beer is sold. The company is steadily extending these benefits beyond the letter of the law. Legally, spirits may be sold to youths of fifteen. The company has extended the age to eighteen. The hours of closing have been reduced from 10 P.M. to 7 in winter, 8 in summer. It does not use all its licenses, nor allow places of sale to be opened in the new quarters of the town. It has reduced the strength of the alcohol from 46 to 40 per cent.

A weakness of the system is the temptation of the commune to use the revenues simply for fiscal purposes. Friends and opponents therefore now demand that the profits of the brandy sales should go direct to the government to be used for the objects which are most closely connected with the evils of intemperance. Norway, especially, has recognised this danger, and is showing interesting results. It is, however, conceded that though "brandy is checked, beer and wine go on apace." The spread of beer drinking, especially in the country, is now so serious as to have brought about an agitation for the company control of beer and wine. A leading Norwegian authority, Director Berner, believes that this final step is only a question of time. Though the "Gothenburg System" has been praised far beyond its deserts, the evidence is irresistible that a very distinct social advantage has been won under its influence.

[Reports that have been published since 1885 by Dr. S. Wieselgrin of Stockholm, now general director of prisons, are of great value, as he is one of the few writers upon this much debated subject who speak without passionate prejudices. An entire summary of his opinions may be found in the *Bericht des III. Congresses gegen den Missbrauch geistiger Getränke*, Christiania, Sept. 1890. This report also contains an admirable paper by H. G. Berner, showing the development of this system in Norway. Both articles are followed by a discussion by those who represent friendly and hostile attitudes toward the system. Important matter may also be found (pp. 55, 61, 66, 116, 121, 156, 383) in the bound vol. of the *Internationale Monatschrift zur Bekämpfung der Trinksitten*, 1891. *Erster Jahrgang*, Bremerhafen, C. G. Tienken.—See *Local Option in Norway*, T. M. G. B.

GOUGE, WILLIAM M. (1796-1863), was born in Philadelphia. He became editor of the

Philadelphia *Gazette* and other journals, and for many years was connected with the treasury department at Washington, and died at Trenton, N.J. He gave special attention to the subject of American money and banking, and his works still remain a principal source of information. He wrote *Short History of paper money and banking in the United States, to which is prefixed an inquiry into the principles of the system, with considerations of its effects on morals and happiness*, Philadelphia, 1833, 2nd ed. 1835, pp. xii., 140, 240. The historical sketch is valuable for the details concerning the organisation of American state banks, and the frauds and abuses associated with their management during a period when there was very lax legislative control. Gouge advised the withdrawal of bank-note issues, and the separation of the fiscal concerns of the government from the banking interest. A portion of this work was republished in England by William Cobbett under the title of *The Curse of Paper Money*. Gouge also wrote *An Inquiry into the expediency of dispensing with Bank Agency and Bank Paper in the fiscal concerns of the United States*, Philadelphia, 1837, pp. 56, in which he advised the establishment of a system of subtreasury offices; and *The Fiscal History of Texas, embracing an account of its Revenues, Debts, and Currency from the commencement of the Revolution in 1834 to 1851-52, with remarks on American Debts*, Philadelphia, 1852, pp. 327. See also in the *Banker's Magazine*, v. 14, July 1859, "The Banks of the United States," pp. 3-9, in which he still insists upon restricting banks to the work of deposit, transfer, discount, and exchange. While employed in the treasury department under Mr. Woodbury, secretary of the treasury, he compiled several valuable reports. D. R. D.

GOULD, Sir Nathaniel (*d.* 1728), merchant of London, was knighted on 14th April 1721. He was a director of the bank of England and member of parliament for New Shoreham, Sussex, from 1700 until his death. He published (1) *An Essay on the Publick Debts of this Kingdom . . . To which is subjoined, An Enquiry into the General Convenience of reducing farther the Interest of our Publick Debts below 4 per cent per annum, in a Letter to a Member of the House of Commons*, London, 1726, 8vo; 2nd ed., 1727; reprinted in 1782, and in Lord Overstone's *Collection of Tracts on the National Debt*, edited by M'Culloch, London, 1857, 8vo. In this pamphlet Gould discussed the sinking fund, showing by the application of the principle of compound interest that it would in course of time more than suffice to pay off the national debt. Gould's work is one of the first in which this argument, which Dr. Price afterwards made famous, is met with. Gould also showed that the debt had been considerably reduced since 1716. His statements were attacked in *A state of the National Debt as it stood Dec. 24, 1716, with the payments made towards the discharge of it out of the sinking fund, etc., compared with the debt at Michaelmas, 1725* [Attributed to William Pulteney and to Archibald Hutcheson], London, 1727, 4to; reprinted in the Overstone collection; and in *Remarks on a late book, entitled, An Essay, etc., In which the evil tendency of that Book, and the Design of its Author, are fully detected and exposed, etc., in a letter to a Member of the House of Commons*, London, 1727, 8vo. Gould replied to his critics in (2) *A Defence of an Essay on the Publick Debts of this Kingdom*, etc., London, 1727, 8vo; reprinted in the Overstone collection. The controversy attracted considerable attention, and was alluded to in the House of Commons, 23rd Feb. 1727-28.

GOURDE. Standard silver coin of Hayti (divided into 100 cents) of the same weight and fineness as the five-franc piece (see Five-franc Piece). F. E. A.

GOURNAY, Jean Claude Marie Vincent de (1712-1759), the son of a rich merchant of Saint Malo, was sent by his father to Cadiz in 1729 and remained there until 1744, engaged in trade. But the young man's mind was not wholly absorbed in his business; and according to his *Éloge*, by Turgot, the fullest account we have of his life, his time was divided between study and his professional occupations and personal relations. From 1744 to 1746 he travelled in England, Germany, and Holland, carefully noting commercial and naval matters and keeping up a steady correspondence with M. de Maurepas, the French minister of navy. In 1746 his partner died and bequeathed him the whole of his fortune, including the estate of Gournay, from which the title under which he is known is derived. In 1748 Gournay returned definitively to France, purchased in 1749 a *charge* of councillor of commerce, and was appointed in 1751 one of the *intendants* of commerce. Having experienced heavy losses in 1758, he resigned, keeping the honorary title, and died in the following year.

Turgot accompanied him in some of his numerous tours of inspection through France, and sums up the opinions on commerce of his master in the following terms: "M. de Gournay concluded that the only object of the administration should be (1) to give to all branches of commerce that precious liberty . . . which they have lost; (2) to favour industry . . . by promoting the greatest possible competition . . . resulting in the greatest perfection in production and the cheapest price for the buyer; (3) to give at the same time to

the latter the greatest possible number of competitors, by opening to the seller all the markets for his produce" (*Éloge*, p. 19, by Turgot, see *Petite Bibliothèque Économique*). "He deemed it impossible that, in commerce left alone, private interest would not be conducive to the general interest" . . . (p. 12). "He was convinced that the money-trade, whose price is the interest paid on money, can only regulate this price with equity . . . by competition and reciprocal liberty" (p. 21). It is with these views, according to Turgot, that Gournay translated the works of Sir J. CHILD and Thomas CULPEPER (Paris, 1754), adding comments which have been lost. Gournay is generally considered as having embodied the "*Laissez nous faire*" of Legendre addressing COLBERT, in the well-known maxim, "*laissez faire, laissez passer*," but Dr. Aug. Oncken in his *Die Maxime Laissez Faire et Laissez Passer* (Berne, 1886, pp. 60-76) ascribes to the Marquis Voyer d'ARGENSON the first half of the formula. Dr. Oncken also refuses to follow DUPONT de Nemours in ascribing to Gournay considerable influence in the development of the physiocratic system (p. 99) and in considering him as a thoroughgoing free trader (p. 109); in fact the *Observations* which are printed along (pp. 72-90) with FORBONNAIS' *Examen des avantages et des désavantages de la Prohibition des Toiles Peintes* (Marseilles, 1755), and which are thought to be written by Gournay himself, though very strong against prohibition, wind up with the proposal of a tax of 10 to 12 per cent on all printed calicoes imported into the kingdom (pp. 87-89). Still it must be allowed that the transition from absolute prohibition to a duty of 12 per cent means something more than "liberal mercantilism" (*Maxime*, p. 109). Excepting his translations, we possess no authentic writings of Gournay. Several are stated to have been written under his direction. This is undoubtedly true of the pp. 254-268 in the first volume of the *Corps d'observations de la Société d'Agriculture de Bretagne* (Rennes, 1760, see note p. 263). Dupont de Nemours is said to have affirmed that the *Considérations sur le Commerce et particulièrement sur les Compagnies, Sociétés, et Maîtrises*, Amsterdam, in 12mo, 1758) were composed by Clicquot Bervache under "the eyes and with the advice of Gournay," and the copy in the Bibliothèque Nationale in Paris bears the MS. note "par De Gournay" in a handwriting of the last century; but M. de Vroil, who inserts a copious analysis of this pamphlet in his *Étude sur Clicquot Bervache* (Paris, 1870), does not support this opinion. E. Ca.

For Gournay's administrative career see *l'administration du commerce au xviii^e siècle* in app. to Biollay's *Pacte de Famine*. Paris, 1885.

GOVERNMENT, ECONOMIC EFFECTS OF. The economic effects of government on society are extraordinarily complex and elusive. In an organic body it is well-nigh impossible to determine exactly the effect which any one organ exerts upon the others and upon the whole. For all the others react upon it. We may ascribe the progress of wealth or of poverty to the working of government, but we cannot be sure how far the government as well as the economic condition of that society is the result of national characteristics and natural conditions. Every general statement respecting the economic effects of different kinds of government must be regarded merely as a rude approximation. Subject to this caution, it may be said that government affects the economic condition of society chiefly in two ways, the one direct the other indirect. The direct economic influence of government is exerted in legislation, in executive action, in the administration of justice, and in foreign and colonial policy. The indirect economic influence of government is the result of its influence upon the character of the people.

I. *Direct economic influence of Government.* —(1) Legislation. Scarcely any law can be framed which will not by a short or long chain of cause and effect produce some economic modification. But a direct economic influence attaches to legislation upon any of the following topics:

(*a*) The law of property determining the modes in which property may be acquired, the restraints imposed on its alienation, the rules of intestate succession, the limits of testamentary power, the degree to which ownership may be subdivided, the incidents of mortgage, the possible kinds of servitudes, the registration of title, and many other subjects.

(*b*) Commercial law, which regulates the making of contracts, the formation and dissolution of partnerships and joint-stock companies, the procedure in bankruptcy, the peculiarities of bills of lading and negotiable instruments, the rights and liabilities of bankers, the protection of patents, trade marks, and copyrights.

(*c*) The law of procedure, which determines in what manner redress for civil or punishment for criminal wrongs must be sought. Its economic influence will vary as it is more or less conducive to obtaining justice in a reasonable time and at a moderate expense.

(*d*) The criminal law, which, by defending liberty of person and security of property, makes industry and commerce on a large scale possible. Its economic usefulness will depend on its being complete, explicit, and severe enough to deter from crime without being so severe as to awaken general sympathy for criminals.

(*e*) Administrative law, which defines the objects of administration, creates the administrative bodies, and regulates their powers and procedure. Under this head may be placed all the laws which deal with national defence, the army and navy, public health, education, the relief of the poor, and the regulation of industry,

whether to protect the producer or to ensure the quality of the product.

(*f*) Financial and fiscal legislation, including all laws determining the standard and denominations of the currency, the incidence of taxation, imposing duties or granting bounties for the encouragement of native industry.

In dealing with the subjects above enumerated the legislator is obliged to consider (1) how much he will bring within the scope of his laws and how much he will leave to individual prudence or virtue; (2) when he is satisfied that legislation is expedient, how much weight should be allowed to purely economic as opposed to moral or political considerations,—in other words, when he should sacrifice the greatest immediate increase of national wealth to promote national security or moral and intellectual progress. The most judicious economists will not maintain that they possess any special knowledge enabling them to give dogmatic answers to these questions. Practical sagacity and political knowledge must determine at any given time the best limit to legislation. Arguments for non-interference based on the natural right of every man to do what he likes, and arguments for interference based on the organic character of the state, do not afford much assistance. The really strong argument for state interference is that co-operation is power, and that the state is the only, or at least the most powerful, co-operative organisation which can be used for certain purposes. The really strong argument against state interference is that it increases the power, in any case enormous, of governments which, under every constitution, monarchic, aristocratic, or popular, are usually composed of very ordinary men, subject to error, to indolence, and to sinister interests.

So, likewise, the choice between the greatest immediate addition to national wealth and some great moral or political gain must be decided, not by the special knowledge of experts, but by broad practical wisdom. But when the legislator wants to ascertain the causes which have resulted in the actual economic condition of society and the extent to which it may be ameliorated by new laws, he may with advantage take counsel of the economist. For such is the complexity of economic phenomena that a new tariff, a new poor-law, or a new regulation of the hours of labour, frequently produces results which its authors never expected and certainly never desired. In order to predict, so far as it is possible, the consequences of economic innovations, special knowledge and habits of scientific analysis are of the utmost value.

(2) *Executive.*—The various forms of administrative organisation and their principal economic effects have been described in another article (see ADMINISTRATION). Here only a few general observations need be added. It is an English tendency to underrate the importance of administration as compared with legislation. For this there are several reasons. Parliament, the assembly which makes laws, is much the noisiest and most conspicuous part of the great machine of government. The administration of national and local affairs has for a long time past been tolerably pure and efficient. Lastly, many things which are elsewhere done by the public administration are here done by private enterprise. Thus we are prevented from realising how much depends on the integrity and efficiency of the administrative body, how terrible may be the consequences where the administrator is inert, corrupt or timid.

(3) *Administration of justice.*—Although the form of the law and the constitution of the courts are settled by the legislature, the quality of the justice actually administered depends on the integrity of the judges, their immunity from intimidation, and their power to enforce their decrees. We hardly realise the importance of the first of these conditions because with us it has been so long fulfilled. But where justice is venal all commercial transactions are affected with uncertainty. There is one law for those who can and will bribe; for those who cannot or will not bribe there is another law. The wrong-doer can escape retribution by dividing his spoil with the judge, and the injured man submits to a loss when he cannot afford to purchase redress. Such a pollution of justice destroys confidence and hope, the mainsprings of industry; and the misery thus engendered may be measured by the eagerness of orientals to find an upright judge. Immunity from intimidation is not less essential than integrity to the righteous dispensation of justice. Judges have at different times been liable to intimidation by powerful individuals —not rare in mediæval England, or by an arbitrary government—as in the reigns of the Stuarts, or by popular agitation, which is the only mode of intimidating that need be feared in western Europe at the present day. In all three cases the result is the same,—the operation of the law is rendered uncertain and the sense of security is deeply wounded. Lastly, there will be little benefit derivable from the integrity or the courage of the courts if they cannot enforce their decrees. Yet this elementary condition of order and economic progress has not been and even now is not universally satisfied in many parts of the civilised world.

(4) *Foreign and Colonial Policy.*—As there is no commonwealth of nations in which each is protected and controlled by an irresistible government, every state must trust to its own strength for the defence of its interests and even of its life. Thus political power is a primary condition of economic development. But nations do not grow into power sleeping. Only by unceasing vigilance, by untiring energy, and

by stubborn fighting courage, can a nation hope to become powerful. War always involves an interruption of industry and a destruction of wealth. But war does not always involve an ultimate economic loss. It may be the only means of securing an economic gain. It has been said that the seven great wars which England waged between 1688 and 1815 left no permanent result except the national debt. It would be far truer to say that the cost of these wars has been returned to England one-hundredfold. They procured for England the free development of her institutions, the supremacy of the seas, the largest share in the carrying trade, a colonial and an Indian empire, —all essential conditions of her economic progress. As founders of English prosperity Wolfe and Clive, Nelson and Wellington, rank with Hargreaves and Arkwright, with Watt and Stephenson. On the other hand, no permanent economic advantage resulted to France from her brilliant victories and European supremacy in the time of the first Napoleon. She sustained grave economic injury in the slaughter of so many of her bravest and most adventurous citizens, in the violent dislocation of her commerce, and in the false direction given to her energies. Thus there is no simple *a priori* rule for determining the economic effect of a foreign policy. Even if such a rule could be found, it would not be sufficient for our guidance apart from moral and political considerations. Colonial policy likewise has an influence upon national prosperity too extensive to be examined here.

II. *Indirect Economic Influence of Government.*—Whatever strengthens the national character and intelligence is economically beneficial. Therefore a political constitution which tends to develop the intelligence and character of the people tends to make them prosperous. In certain stages of civilisation this benefit is conferred by a powerful autocratic government which represses local feuds, breaks down the barriers of local prejudice, and compels a rude population to orderly industry. In other stages of civilisation the same benefit is derived from a large measure of political liberty. Political liberty is indeed a vague term. It means sometimes freedom from foreign domination, sometimes comparative freedom from interference by the national government, sometimes the possession of a vote in deciding who shall govern, and sometimes the right to take an active personal part in administration. But in any or all of these senses it is a means of prosperity to those who are fit to enjoy it.

Foreign domination involves the transference of a certain amount of wealth from the subject to the sovereign community, whether as mere tribute or in discharge of the cost of government and defence; it often involves considerable interference with the commerce and industry of the subject for the benefit of the sovereign community, and it often depresses energy and intelligence by closing or at least narrowing the possibilities of a great career. These disadvantages, however, may be partly lessened, partly compensated, if the dominant people have much to impart to the conquered, whether in better laws and institutions or in improved mechanical appliances or in general intellectual cultivation. The subjugation of barbarous by civilised nations has been one of the principal means of human improvement.

Personal independence, the freedom of the individual, especially the freedom to associate with other individuals for common ends, is essential to the highest economic development. For that development cannot be attained except by a daring, inventive, and original people. Such a people will not submit to unreasonable and vexatious interference, or if it does, it will lose its most valuable qualities. It may continue to be noted for a plodding industry and a minute thrift, but these virtues are not enough to maintain its pre-eminence. The saying that England has been made by her adventurers will be found more or less true of every great commercial community. But even when personal independence has been too much restricted, the possession of a vote and the imagination that one can change the government whenever one has a mind, mitigate the sense of constraint and the consequent loss of energy. Lastly political freedom in the sense of the right to an active participation in public affairs would be highly stimulating to intelligence and character if men generally availed themselves of it. But this is rarely the case in civilised countries, where business, study, and pleasure absorb the energies of ninety-nine citizens in a hundred. It is a common complaint among ourselves that the composition even of the most important local assemblies tends to become worse rather than better. We cannot here consider how far this complaint is well founded. If such a deterioration were real and long continued, it would reduce self-government to an empty form.

GOVERNMENT REGULATION OF INDUSTRY.

Earlier History, p. 239; In the 19th Century, p. 242.

Earlier History.—It will be convenient for the discussion of this topic to divide the survey into three main periods: (1) From the Norman Conquest to the time of Edward I.; (2) from Edward I. to Elizabeth; (3) from the days of Elizabeth to the decay of the mercantile system at the close of the 18th century.[1] In the first of these epochs interference with industry on the part of the government was considerably less than in either of the other two; the regulation of industry was left largely to local and municipal authorities, and that which emanated from the government may be described as of a personal nature, proceeding chiefly from the initiative of the sovereign. In the second period the whole field of national industry is regarded as under the supervision of the government, though much is still left to local municipal or corporate authority. Regulations became national and even international in character, being enacted for a distinctly national purpose; while in the third period the subordination both of industry and commerce to national purposes and national ends is more and more definitely aimed at. Of course in every period the influence of particular classes, whether landowners, merchants, or manufacturers, must be taken into account, as each class endeavours to modify legislation in accordance with its own particular interests.

I. Before the Norman Conquest, which is here taken as our starting-point, legislation on and interference with industry or commerce were only fragmentary in character. Such regulations as existed were chiefly framed by the king to secure the safety of merchants travelling in his dominions, to promote intercommunication and the proper conduct of trade generally (Cunningham, i. 75, and *Laws of Alfred and Ine*). To suffice for themselves in all industrial pursuits was the aim of the various villages, towns, or districts, though "there is no evidence that the early English villages valued their condition of self-sufficiency so highly as to try to check the development of trade, as had been done by German and Indian communities." Moreover it was perceived, at least by Alfred (*Boethius*, i. c. 17), that the common good depended on the interdependence of the various occupations of industry, and on their harmonious development and working. Royal control consisted chiefly in attempting to secure adequate protection for person and property so that this development of commerce and industry might be efficiently carried on. This royal control, however, became more powerful in many ways with the consolidation of the feudal system in England after the Norman Conquest. That system rested almost entirely on royal authority; industry and commerce were regulated largely, when regulated at all, by royal decisions. The distinguishing mark of feudalism as regards industry is that royal authority supports local and traditional custom, while that custom left very little opportunity for the development of individual enterprise. Agricultural industry was hampered by the manorial system and collective ownership of land (see MANOR; AGRICULTURE IN ENGLAND), while prices both of agricultural and manufactured products were regulated by authority, *e.g.* by the ASSIZE OF BREAD AND BEER, which is considerably older than the reign of Henry II., and by the assize of cloth, which, though found in operation in the 13th century, even then refers to the "old assize of the mystery." The development of industry upon anything like a capitalistic basis was interfered with by the system of taxation, which practically discouraged accumulation by the operation of tallages, aids, and fines levied to swell the royal revenue. It should, however, be noted that at this period industry was only affected indirectly by taxation, for the taxes were (i.) not regular, but levied for special occasions of royal need, and (ii.) they fell not on regular incomes derived from industry or trade, or upon industry itself, but on the hoards of wealth accumulated by the rich in whatever walk of life. Also (iii.) in the case of tolls they represented payment given for royal protection. In other matters the whole conduct of industry was subjected to regulations of a local or private character emanating from the gilds (see GILDS and APPRENTICESHIP), or from municipal authority. Almost the only *general* regulation applying to the whole kingdom may be summed up in the arrangement of a uniformity of weights and measures (see ASSIZE OF WEIGHTS AND MEASURES), the assizes of bread, ale, and cloth, and other points in which the king and his court were directly interested as large consumers.

II. The reign of Edward I., inaugurating as it did the system of government, to some small extent at least, by the aid of the representatives of the nation—the first parliament in which all these representatives were summoned together in *one assembly* met in 1295—also inaugurates, as a result of this change in the method of government, a period when the regulation of industry becomes a matter of national and not merely local concern (see Cunningham, *Growth of English Industry and Commerce*, i. 265). It seems to have been the wish of the government of that day that industry should be regulated in the interests of the nation as a whole; not so much in order to gain national power as to increase the national wealth and to afford plenty to

[1] For later period, see FACTORY ACTS; GOVERNMENT REGULATION OF INDUSTRY IN THE 19TH CENTURY.

the people. There seems to have been also a wish to have definiteness and uniformity in prices and in taxation. In taxation, *e.g.*, fixed customs were levied, the half-mark on each sack of wool and on the *prisa recta* of two tuns on each shipload of wine. Anything beyond this was regarded as an occasional subsidy for a special purpose. This taxation interfered, however, to some extent with industry, for, chiefly in order to facilitate the collection of the customs, the export trade was regulated by the "staple" system (see STAPLE). The export of wool, *e.g.*, was hereby forced into definite channels and allowed only at certain ports by Edwards I. and III., who thus asserted the royal right of controlling trade. In other points it may be said that the Edwards legislated for industry with a view rather to the interests of the consumer than of anybody else, though Edward III.'s encouragement of Flemish immigration, in 1331 and other years, seems to point to a definite plan of increasing national wealth by promoting new industries; and his general legislation for the wool trade is a series of attempts to keep up a high price of wool to foreigners—an attempt largely successful, owing to the almost complete monopoly which England possessed in this commodity. The interference with industry that is marked in the reign of Edward III. by the historically famous First Statute of Labourers (the 25 Ed. III. c. i., A.D. 1351) is strictly in accordance with the spirit of the age in which that statute was enacted. It was the custom of the time to regulate prices by authority, and this interference on the part of the government did not cause discontent. Hence parliament was not enforcing a novelty when, in this First Statute of Labourers, and in many subsequent ones, it endeavoured to regulate the price of labour as well as of provisions and cloth. At the same time it cannot be denied that, owing to the peculiar circumstances of the period succeeding the Black Death (see BLACK DEATH), the legislation in regard to wages of workmen and their right to combine tended to become partisan legislation in the interest of the landowning classes who made the laws. Still we must be careful to observe that these statutes are in the main a fair attempt to regulate prices and wages *together*, so that one should follow the other. Another important object of all labour legislation from the 25 Edward III. c. 1 and the 12 Richard II. c. 4, was to secure a sufficient amount of labour for agriculture, as being the most important industry in the country, and also as being that in which the landowning legislators were most nearly concerned. (For a useful summary of the various statutes of labourers, cp. Thorold Rogers, *Economic Interpretation of History*, ch. ii.). In non-agricultural industries we may notice that in the period from Edward I. to, say, Henry VII., government interference becomes more and more marked, as it is more and more needed, owing to the unsatisfactory manner in which the gild system was now beginning to work, and owing to the great development of the manufacturing industries. In the reign of Richard II. this interference begins to assume the character that afterwards developed into the MERCANTILE SYSTEM (*q.v.*) of Elizabeth and the Stuarts, for it becomes an axiom that commerce and industry are to be regulated with the object of promoting national power through national wealth. Hence we find numerous statutes framed to encourage native shipping—the 5 Rich. II. st. I. c. 3 may be called our earliest navigation act—to attract bullion into our merchants' hands (5 Rich. II. st. I. c. 2), and to protect native industry against aliens (as by the 33 Hen. VI. c. 5 and the 22 Ed. IV. c. 3). Now, too, begins more definitely the era of the CORN LAWS (*q.v.*), whereby government tried to encourage arable farming as against the growing practice of sheep-farming for the sake of wool (cp. 12 Rich. II. cc. 3-7), to secure a large agricultural population (7 Hen. IV. c. 17), and to promote corn-growing by allowing the export of English corn (17 Rich. II. c. 7 and 15 Hen. VI. c. 2), and forbidding the import of foreign grain (3 Ed. IV. c. 2 and 23 Hen. VI. c. 5). In the Tudor period this feeling of a national policy grows stronger, and it is felt that the interest of the individual must be sacrificed to that of the nation, if, by so doing, national power will be increased. As national power seemed to depend upon the growth (1) of shipping, as a feeder to the navy; (2) of population, and especially agricultural population, as a feeder to the army; and (3) of treasure, we naturally find (1) the series of navigation acts continued (*e.g.* 23 Hen. VIII. c. 7, 2 & 3 Ed. VI. c. 19), and (2) the statutes of labourers kept up (*e.g.* 11 Hen. VII. c. 22), and the depopulation of rural districts through sheep-farming or migration to towns severely checked (4 Hen. VII. c. 16 applying to the Isle of Wight). Also (3) numerous acts were passed to secure a large supply of bullion for this country (cp. Cunningham, *Growth of Eng. Industry and Commerce*, i. 387). As the gilds were now decaying and their usefulness decreasing, we find the government reducing them more and more under its authority (1 Hen. VII. c. 5) till Somerset, following the policy of Hen. VIII., completed their ruin by confiscating their lands (1 Ed. VI. c. 14, A.D. 1547). At the same time the power of the gilds, especially of those which represented the working classes, being an object of jealousy to the Tudors, the government was by no means loth to interfere with them (cp. also the re-enactment of laws against combinations of workmen by the 2 & 3 Ed. VI. c. 15, and see COMBINATION LAWS).

III. In the Elizabethan code of regulations for industry we find government interference and the desire for the development of national power very strong. So distinctly was this the case that private interests came to be looked upon almost with disfavour, especially in the case of combinations of workmen (see COMBINATION LAWS). Legislation continues much on the old lines in (1) the Navigation Acts of 1 Eliz. c. 13, 5 Eliz. c. 5, and the more famous Acts of 1651 and 1660; (2) the Corn Laws of 13 Eliz. c. 13, of 15 Charles II. c. 7, encouraging the growth and export of corn, and again by the 35 Eliz. c. 7, which endeavours to force all surplus labour into agriculture, and by all the legislation which followed (see CORN LAWS); (3) the protection and encouragement of native manufactures by prohibiting foreign imports (5 Eliz. c. 7) and restricting the export of raw materials that might be worked up at home (as of wool and live sheep, in 8 Eliz. c. 3), while the consumption of native manufactures is to be encouraged, as by the law 13 Eliz. c. 19, providing that men must wear caps of English make. As regards interference with (4) labour and wages, the legislation of Elizabeth has well been termed monumental, and it continued to operate with practically little change till well into the 19th century. The famous Statute of Apprentices of 1563, the 5 Eliz. c. 4 (see APPRENTICESHIP) had for its objects to regulate wages in accordance with prices by assessment, to encourage good service by checking migration from one employer to another, to secure good work by making apprenticeship compulsory—seven years for artisans and longer for husbandry—and to encourage agriculture by making all those who were not otherwise employed serve in husbandry. It was meant to improve rather than to depress the condition of the labourer, and though afterwards much misused by employers, is a curious monument of kindly meant paternal legislation. This act did not apply to new trades that came into existence after 1563, and therefore these were regulated generally by provisions in the patents given to those who started them. In this code of legislation, however, no provision was made for supervising the quality of manufactures, as had been done in previous times (*e.g.* by the aulnager for cloth; see AULNAGER). Hence we find the state now re-organising companies like the old craft-gilds (cp. Cunningham, as above, ii. 48) or granting to *patentees* rights of search and supervision of particular goods throughout the whole kingdom. This naturally led to monopolies being granted to individuals (see MONOPOLY), and monopolies again came to be a source of revenue to the crown. It must be said, however, in favour of the much-abused monopoly system, so prominent under the Stuarts, that theoretically at least it provided for the government a check upon developments of trade that might prove detrimental to national interests.

The policy of the government in its interferences with industry after the Stuart period, and especially after the revolution of 1688, was to develop the industries of the country in every possible way. In the endeavour to carry out this policy England was only following the example of her continental neighbours, the Dutch and the French, for navigation acts and the protection of native industries were not by any means confined to England. The chief points aimed at by English statesmen of the 18th century were (1) the provision of a sufficient supply of raw material (*e.g.* of wool, and even of woollen yarn, 12 Geo. II. 21), by encouraging imports of such commodities and preventing their export; (2) the prohibition of the import of finished goods into British markets, while *e.g.* even Indian muslins and calicoes were subjected to strict regulations lest they should interfere with our linen trade (see 11 & 12 Will. III. c. 10); and (3) attempts were made to encourage the consumption of home manufactures, partly by sumptuary laws (*e.g.* by the 18 Geo. II. c. 38, and 21 Geo. II. c. 26, which imposed penalties for wearing French cambric or lawn), and partly by compelling the use of British commodities in certain cases (*e.g.* sail-cloth, 19 Geo. II. c. 27). The woollen cloth trade in particular was most carefully encouraged (see Cunningham, ii. 340), though both in manufactures and in agriculture the policy pursued tended to foster merely class interests. But if certain classes persuaded parliament to legislate in their own private interests, as one class in particular constantly did, parliament still believed that it was doing its best for the country. This was specially the case when the landed interest was the largest in the kingdom and when, as in the 17th and 18th centuries, agriculture was the foremost of our industries. But when the industrial revolution made itself felt in George III.'s reign, and the new manufacturing interests became more dominant, English industry outgrew very quickly the various regulations and restrictions originally intended for its benefit. The ASSIZE OF BREAD AND BEER, for instance, had even in 1709 to be revised (8 Anne, c. 18); the assessment of wages was fast becoming inoperative, and by 1795 seems almost to have been forgotten (Cunningham, ii. 359). In fact "the introduction of machinery brought about the collapse of the industrial system of Elizabeth"—a system of wonderful comprehensiveness that had gathered up the tentative legislation of previous centuries and left its mark, both for good and ill, on that of centuries that followed it.

H. de B. G.

GOVERNMENT REGULATION OF INDUSTRY IN THE 19TH CENTURY. The history of state action in England, during the present century, may be divided into two periods. In the earlier, the legislature was anxious to avoid interference with the economic and industrial action of individuals. In the later period, the legislature has become more and more disposed to regulate their activity. It must not be supposed that either tendency has operated at any one time wholly unchecked by the opposite tendency. The repeal of old and the enactment of new regulations have been, to a large extent, simultaneous. Nevertheless, there has been a marked change in public opinion, and in legislation on industrial questions. This change, being necessarily gradual and irregular, cannot be assigned to any one year. But the repeal of the Corn Laws in 1846 may be regarded as the last great achievement of the policy of LAISSEZ-FAIRE. Since then the policy of state interference has been gaining the ascendency. The circumstances of England, in the beginning of the 19th century, were propitious to the policy of removing all restraints on the economic action of individuals. The improvement of machinery was revolutionising commerce and manufactures. This revolution rendered the ancient system of regulation, dating chiefly from the reign of Elizabeth, totally inapplicable. The attempt to control prices and wages, to ensure a proper training of the workman, or a satisfactory quality of products, became more hopeless than ever. The incessant change and expansion of industry impressed reflective minds as some vast natural phenomenon which could not be guided or controlled. The middle class, which had gained so much in wealth and in political power by the industrial revolution, was instinctively averse to state control. Confident in its talent for business, its energy, and accumulated capital, It felt that, with freedom, it was more than a match for all competitors. The current philosophy fell in with the instinct of business men. It was deeply tinged by the optimism of the 18th century. The economic theory of Adam SMITH, and the legislative theory of BENTHAM, are alike pervaded by a belief in the beneficence of nature or of Providence. Nature or Providence, according to these theories, so orders human life that the endeavour of each to secure his own happiness produces, automatically, the happiness of all. It follows then, that, in almost every case, the state does most for the general welfare by allowing everybody to do the best he can for himself. And thus, in the first half of the 19th century, the economic facts of the time, the instinct of the class which was acquiring political predominance, and the philosophical theories generally received among thinkers and statesmen, all tended to reduce the action of the state within the narrowest possible bounds.

The result was seen in legislation. The apprenticeship and combination laws were repealed. The exclusive privileges of corporate towns were abolished. The poor law, which had been expanded into a system of supplementing wages out of rates, was reformed, and became merely a provision for the destitute. The protective tariff was gradually abolished. But whilst the old forms of state regulation were disappearing, the course of events and of speculation were bringing about a reaction in favour of state interference. For, as the new industrial system developed, it was found to produce evils which individual action could not remedy. These evils led to legislation, for workers in factories, as early as the year 1802 (see FACTORY ACTS). The wage-earning class, which has gradually acquired the largest share of political power, has always felt that its strength lies in combined action—not in individual enterprise—and has usually favoured the principle of state regulation. At the same time, philosophical reflection has taken new forms. The belief in the beneficence of nature has given place to the doctrine of the struggle for existence. This doctrine is incompatible with the notion that the general interest is best secured by everybody's endeavour to promote his own interest. Thus philosophers have become more willing to accept the deliberate regulation of industry by an authority which, at all events, professes to represent the whole community. The reaction towards mediæval ideas, expressed in the high church movement, and in the writings of Carlyle and Ruskin, has also contributed to lessen the value formerly attached to individual responsibility and individual freedom. A third influence, favourable to the extension of state control, may be found in the literature and philosophy of the most civilised continental peoples—especially of the Germans. At the beginning of this century the English people, isolated by its long war with France, and proud of its achievements in that war, had touched the highest point of arrogant self-confidence. Englishmen were inclined to regard all imported theories with suspicion, and, if they related to commerce or industry, with contempt as well. All this has been changed. The material progress of other nations has raised their standing in English eyes. The political and economic pre-eminence of England has been much reduced. Increased facilities for travel and transmission of intelligence have made the Englishman more cosmopolitan. The vast space which the action of government fills in such countries as France or Germany, and the audacious theories which it has generated, have made a deep impression on the English mind.

Lastly, the benevolent despotism which we have established in India, with at least a wonderful apparent success, has re-acted on English political ideas, and has recommended state action to many who would not have been accessible to speculative arguments.

The practical result of the change in public opinion, insensibly produced by all these agencies, is seen in the sweeping legislation of the last forty years. During that time the state has extended its activity in every direction. Following up its first hesitating interference on behalf of children employed in factories, the state has taken steps to secure the safety, health, and comfort of persons engaged in almost every dangerous or unwholesome occupation, whether in mines, in ships, or in factories. It has provided a complete system of gratuitous elementary education. In Wales it has organised secondary education, and everywhere it has begun to promote technical education. It has established an elaborate sanitary administration. It has increased the functions of the post-office, acquired the telegraphs, and re-adjusted the rates charged for the carriage of goods by railways. It has augmented the burthen of taxes, and the number of workmen and officials whom it employs. It has enlarged both the duties and the revenues of local authorities. But all that the state has done is little in comparison with that which it is incessantly called upon to do. It is invited to appropriate the "unearned increment" of the land, or the land itself, at least in towns; to acquire all mines; to regulate the hours of labour for all workmen; to secure to them and their families good lodgings at low rents; to feed their children whilst at school; to cater for their amusement; to provide them with pensions when past work; to take over one branch of industry after another, as fast as it can find the requisite capital and organise the requisite staff; in short, to enter upon a course of development which would finally make state action co-extensive with the life of society.

It would be difficult, if not impossible, to attempt an exact estimate of what has hitherto been done in extending the action of the state, or to criticise the proposals for its further extension. Few reasonable men will be disposed to agree with the extreme doctrine of *laissez-faire* inculcated by Mr. Herbert Spencer. They will rather incline to judge each new proposal for state interference upon its merits, testing it especially by means of recorded experience. At the same time they will remember that human nature, whilst capable of gradual modification within certain limits, is, in its main attributes, unchangeable. They will remember that the action of the state is, after all, the action of a number of rather commonplace human beings, and they will be slow to accept any political scheme which puts an enormous strain upon the industry, intelligence, or honesty of those who administer the commonwealth.

[Mill on *Liberty*.—Herbert Spencer, *The Man Versus the State*.—Jevons, *The State in Relation to Labour* (English Citizen Series).—Ritchie, *Principles of State Interference*.—Cunningham, *Growth of English Industry and Commerce in Modern Times*.—Toynbee, *Industrial Revolution*.]

GRACE, DAYS OF. See DAYS OF GRACE; BILL OF EXCHANGE, LAW OF.

GRADING. In many markets dealings take place without inspection either of samples or bulk, but upon the basis of certain standard qualities or values, and for this a properly organised system of grading is necessary. Whether the bargains are for consumption or speculation it is equally necessary that sellers and buyers should know exactly what it is they undertake to deliver or receive. In the metal trades the requisite uniformity is obtained by assay. Dealings in bullion on the London market are on the basis of the mint standards. The bars delivered are usually fine, but are reduced to uniformity by calculation on assay. In copper most bargains are in "G. M. B." bars—"good merchantable brands" of about 96 per cent, with allowances for difference in deliveries. In pig-iron there are recognised qualities with different prices for brands of different makers. Raw or thrown silk and wool are capable of containing a considerable amount of moisture, which is not apparent to sight or touch, and which materially affects the value in proportion to weight. It is therefore usual to require a certificate from one of the conditioning houses (see CONDITIONING), as to the proper degree of dryness of every parcel. In mineral oils, quality is tested by special associations, and the certificates of the Petroleum Association in London, and of the United Pipe Line in the United States, are the customary basis of transactions.

In proportion as the articles dealt in are less modified by art, the possibility of bringing them to a fixed basis is diminished, and it becomes necessary to grade them by comparison of their actual condition with some more or less definite standard. Thus the great wheat deals in the States are made in No. 1, 2, or 3 quality, and it is alleged that the arbitrary manner in which a farmer's produce may be graded opens a way to great injustice and fraud. Grading or some means of insuring uniformity of quality is essential in all dealings that are to be settled through a clearing house, as all clearing systems are founded upon the principle that delivery by the first seller is acceptable to the last buyer (see also CLEARING SYSTEM, LONDON; PRODUCE CLEARING).

R. W. B.

GRADUATED TAXATION

Meaning of terms, p. 244; History of, in different countries, p. 244; Athens, Florence, Holland, Great Britain, Switzerland, Australasia, New Zealand, Canada, p. 244; Theory of, p. 246; Arguments for, p. 246; Arguments against, p. 248.

GRADUATED TAXATION, TERM. The term "graduated taxation" is commonly used in contrast to "proportional taxation." Proportional taxation implies the same rate on all amounts of the thing taxed, whether it be property, income, or anything else. Graduated taxation generally means that the rate increases as the amount of property, income, etc., increases. More accurate is the term *progressive taxation*. For in a graduated tax the gradation may be either upward or downward. If the gradation is upward we have progressive taxation; but if the gradation is downward, that is, if the tax rate decreases as the income increases, we have what is technically known as *regressive* taxation, or what the French call upside-down progressive taxation (*progression à rebours*). When the tax rate increases up to a certain point, but remains constant beyond that point, the technical term is *degressive* taxation. That is, the proportional rate is regarded as the normal rate, but on all sums counted downward below this limit the rate diminishes. In one sense it is immaterial whether we call the tax progressive or degressive. But in degressive taxation the proportional rate begins at a comparatively low figure and is considered the normal rate, concessions being made for the smaller amounts; while in progressive taxation the point at which proportion begins is generally put higher up, so that most of the assessments are made at varying rates. The term "graduated taxation" is commonly understood to imply progressive taxation. Strictly speaking the English income tax, with its system of exemptions and abatements below £500, is an example of degressive taxation, and therefore of graduation. But when we speak of the income tax being "graduated," we commonly mean not the present system of degression, but a development of the progressive principle. While graduated taxation therefore technically includes progression, degression, and regression, the term will be here used in the sense of progressive taxation.

Another possible source of confusion must be avoided. If a different rate of tax is levied on different kinds of property or income, we speak not of a graduation but of a differentiation of the tax. But if different rates are levied on inheritances or bequests according to the degree of relationship of the heir or successor, the tax is also called a *graduated* or *progressive* tax. In ordinary cases "graduation" denotes a changed rate for altered amounts; in this case it denotes changed rates for the same amounts going to different persons. In the following discussion the term will be confined to the first and more important case.

History of Graduated Taxation.—The earliest example of graduated taxation is found in Athens. The direct tax (*εἰσφορά*), as levied by Solon (B.C. 596), was an extraordinary property tax divided into four classes. The graduation was introduced not by changing the legal rate, but by changing the assessable portions of the property. Thus the highest class was assessed at the full valuation; in the second class only five-sixths of the property was assessed; in the third class only five-ninths of the property was assessed; while the lowest class was entirely exempt. When we hear of the tax again in the time of Nausinicus (B.C. 380) the principle of graduation was still observed, although in a slightly modified form. In Rome we have no knowledge of any graduated taxation.

In the middle ages there are several examples, due to the growth of the democratic spirit, especially in the towns. There are but few cases of graduation in the general state taxes. In France the principle of *le fort portant le faible* brought about an application of the graduated scale to the poll and hearth taxes in the 14th century. But the assessors generally inverted the legal principle and made the poor pay higher rates than the rich. Based on these French laws were the English graduated poll taxes of 1379 and 1380, repeated in 1513 and 1641; and the graduated income taxes of 1435 and 1449. In the German empire a progressive property tax was imposed in 1512 in order "that the poor should not be so grievously burdened."

It is chiefly in the mediæval towns that graduated taxation was employed. We have full accounts of its history in Basel and other German towns during the earlier centuries of their existence. But the originally democratic character of the towns was soon modified by aristocratic and feudal influences; and the system soon actually became one of real inequality, pressing more heavily on the poorer classes. We know that this was the case on the continent; and when the history of English local finance comes to be written, it will probably be found to be the case here also. In some places, however, the democratic spirit asserted itself more radically. This is especially true of the Italian republics, whose condition at the period of their great commercial prosperity resembled those of modern cities very closely. The Italian cities, and especially Florence, are the chief examples of graduated taxation in the middle ages.

In Florence at first a general property tax (the ESTIMO, *q.v.*) was employed. In 1427 this was supplanted by the CATASTO (*q.v.*), or tax on the capitalised value of incomes from movables and immovables, which itself gradually gave way to the *decima*, or tenth, a tax on the income from immovables only (see DÉCIMES).

The principle of graduation was first applied to the *catasto* in 1443, under the name of *scala* or scale. One of the chief reasons of its introduction was the evasion of the proportional tax on personal property by the wealthy, and the hope to re-establish the balance in some sort in this way. But the Medici eagerly seized on this course of reasoning, and soon converted the graduated tax into an engine for ruining their wealthy rivals. The rates varied at different times during the 15th century; some of the more extreme scales were 4 to 33⅓ per cent of the income, and 8 to 50 per cent. The *decima scalata* was one of the causes of Florence's downfall. But it is to be noted that what was begun by the Medici was continued by the democratic government, and that Canestrini, the historian of the tax, expressly tells us that the fault lay not so much in the graduation as in the frequency and burdensomeness of the taxes, and the utter arbitrariness of the whole tax administration. The graduated tax was levied for the last time in 1529.

During the 17th century we hear but little of graduated taxation. In the 18th century we find more frequent examples, until the revolution of 1789 and especially that of 1848 gave the signal for a far more wide-spread application of the principle during the present century.

In 1742 we find a classified income tax in Holland, a progressive income tax (from 1 to 8 per cent) in Prussia. In Geneva the *taxe des grades* of 1789 was levied on a slightly graduated scale. In England Lord North's tax on inhabited houses in 1778 was graduated. This tax was repealed in 1834; reimposed without graduation in 1851. Graduation on a degressive plan was introduced into it again in 1890. The French tax on rental values of 1791 was also graduated, as was the United States national tax on dwelling houses in 1798. In Holland, Austria, Baden, and Prussia we find extraordinary property or income taxes levied on the same principle during the first two decades of this century. The graduated principle was also applied in a modified form in Great Britain in the Triple Assessment of 1798 and in the income tax of 1799, the full charge beginning only with incomes of £200 (after 1803, £150).

From about the middle of this century dates a more decided movement toward graduated taxation in the continental countries of Europe, and the last decade or two have witnessed a decided extension of the movement in other parts of the world, including Australia and America. While important examples of graduated taxation are found in the monarchic countries of Europe, the most radical attempts to carry out the principle are found in democracies like those of Switzerland, and Australasia.

In Germany graduation is found both in commonwealth and in local finance. The new Prussian income tax varies from $\frac{6}{100}$ per cent on incomes of 900-1050 marks to 4 per cent on incomes above 100,000 marks. In Prussia, as well as Saxony and other German states, incomes are divided into a large number of classes, and a definite amount of tax is payable for each class. The rate, therefore, varies slightly between the highest and lowest limit of each class. In Baden the system of *Steueranschläge* is followed, according to which only a portion of the actual assessed income is taxable in each class. In the lowest class (500-600 marks) one-fifth of the lowest income is taxable, while the total income is taxable only when it exceeds 30,000 marks. This is the same principle as that of Solon's tax in Athens. In many of the German towns there also exist graduated income taxes, ranging from 1 per cent to 4 or 5 per cent, and in some cases even to 10 or 12 per cent of the income. The municipal income tax, as a general rule, is based on the same assessment and the same principles as the state tax. There is no separate system of graduation.

In Switzerland graduated taxation of property or income exists in some form in sixteen of the twenty-five cantons, while the progressive inheritance tax is found in six cantons, graduated taxation of some kind existing in eighteen out of the twenty-five cantons. In regard to graduated taxation of property or income there are three classes of cantons: (1) Cantons with proportional property tax but graduated income tax, Ticino, St. Gallen, Thurgau, and Oberwalden. The highest rate of the income tax does not here exceed 4 per cent. (2) Cantons with graduated property tax, Geneva and Glarus. (3) Cantons with graduated property and income taxes. Most of the cantons with a property tax levy an income tax on income not derived from property (Baselstadt and Baselland levy it on other incomes also). The graduation is generally much sharper in the income tax than in the property tax, and the rate is in some cases almost 10 per cent.

In so far as the technique of administration is concerned, the cantons may be divided into four classes: (1) Those where different proportions of the assessed income or property are taxable in each class, as in Zürich. (2) Those where the income is capitalised at different rates in each class, as in Solothurn. (3) Those which change the rate for each class, or fix upon a definite sum to be paid by each class. This is true of most cantons. In general a definite rate or sum is charged upon the entire income or property. But a few cantons, like Basel, Zug, Schaffhausen, Aargau, and Vaud, assess the stipulated rate upon each successive increment of the entire amount.

There are many interesting but minor points of difference which it is impracticable to dwell

upon here. But the tendency is toward the spread of the principle of graduation and the increase in the scale. The graduated inheritance taxes are found in Bern, Solothurn, Thurgau, Zürich, Uri, and Schaffhausen.

Graduated income taxes are found also in the local taxes of Belgium and Holland, in the national income tax in Holland, and to a certain extent in Denmark and Sweden. In England outside of the degression in the income tax, graduation is found only in the death duties (see DEATH DUTIES; TAXATION), and in the present INHABITED HOUSE DUTY. In France and Austria the chief instance of graduation is seen in the rental or occupancy tax.

In Australasia we find in most of the colonies graduated inheritance taxes, ranging from 1 per cent to 10 per cent (and in Queensland even to 20 per cent). Here are seen not only the highest graduated inheritance taxes in the world, but also the highest graduated property and income taxes. The most recent act is that of 1891 in New Zealand, which, as lately amended, graduates the land tax from 1d. to 3d. in the pound, according to the value. Graduated property taxes are found also in some of the other colonies.

In the United States the income taxes levied during the civil war were sharply graduated, ranging up to 10 per cent. The income taxes levied by the Confederacy ranged from 5 to 15 per cent, and, in the case of corporate incomes, to 16⅔ per cent. Graduated income taxes were also formerly levied in Virginia. To-day a slightly graduated income tax is still levied in North Carolina. The taxes on corporations are graduated in several of the states, as in Maine (where the excise tax on railways varies from ¼ of 1 per cent to 3¼ per cent of the earnings), Vermont, Wisconsin, Michigan, etc. There is now a strong movement looking toward the adoption of the graduated principle in inheritance taxes, and bills to that effect are pending in several states. In Canada graduated inheritance taxes have recently been introduced in Ontario and Nova Scotia.

Theory of Graduated Taxation.—Graduated taxation has been upheld on three grounds which may be termed, for want of better names, the socialistic, the compensatory, and the economic arguments. The socialistic theory has been advanced, not only by socialists proper, but by economists of repute, like Adolf Wagner, who are opponents of socialism in general, but who propound this particular argument under the name of the socio-political theory. They distinguish between the "fiscal" and the "socio-political" periods in public finance. In the last period, which is now beginning, government must regard it as a duty to bring about a more equitable distribution of wealth, and therefore to interfere with the so-called rights of private property. It is the ethical or social reasons which justify graduated taxation. This argument may, however, be unconditionally rejected. Although in all fiscal policy there is an undoubtedly social element, this must not be confounded with the socio-political or socialistic element. From the principle that the state may modify its strict fiscal policy by considerations of general national utility to the principle that it is the duty of the state to redress all inequalities of fortune is a long and dangerous step. If the equalising of fortunes were an acknowledged function of government, it would be useless to construct any science of finance. There would be only one simple principle: confiscate the property of the rich and give it to the poor. This argument for graduated taxation is not very strong.

What is called the compensatory argument has been advanced by writers like Royer in France and General Walker in the United States. The latter, *e.g.*, states that differences in wealth are due in no small degree to the failure of the state in its duty of protecting men against violence and fraud; and that they are in a measure due to the acts of the state itself for a political purpose. Since therefore inequality of wealth is in a measure due to the state's acts of omission or commission, allowance should be made for it in the tax system; and this can best be done, theoretically at least, through graduated taxation. The objection to this theory is that it furnishes no standard. If graduation is *per se* unequal, it is impossible to correct one inequality by another unless it can be shown that the second will in every respect fit into and counterbalance the first. The test is impracticable.

Similar to this, but of somewhat greater force, is what may be called the "special compensatory" argument. This upholds graduation in some one particular tax, on the ground of its acting as a counterpoise to other taxes. Indirect taxes, *e.g.*, it is claimed, often hit the poor harder than the rich; hence the regressive indirect taxes must be counterbalanced by progressive direct taxes, like a graduated rental tax, or a graduated income tax, etc. Proportional taxation is still the ideal, but the departure from proportion in one direction must be met by an equal departure in the opposite direction. Some ultra-conservatives, like Leroy-Beaulieu, advocate graduated taxes for this reason.

Arguments for Graduated Taxation.—The most important of these are what may be called the economic arguments. They turn about the general theories as to the basis of taxation. The older doctrine of taxation was that of benefits. Since protection was deemed the chief benefit conferred by government, taxes were regarded as insurance premiums paid for enjoyment of security. Hence, it was argued, taxation should be proportional to the property or income protected. Some writers, however, maintain

that the benefits to the individual increase faster than his property or income, since most public expenses are incurred to protect the rich against the poor, and therefore that the rich ought to pay not only absolutely but relatively more. Others have said that certain state expenses confer a proportional benefit on all, but that many kinds of governmental outlay have a special value for the rich. Others confessed that the benefits of state action are theoretically enjoyed by all, but maintained that practically the benefits accrue only to the wealthier classes. Others finally tried to prove mathematically that protection increases faster than property or income. A million pounds belonging to one man is in greater risk of being stolen than the same amount distributed among ten men. Hence the insurance premium ought to be higher. All these writers, arch-individualists as they were, therefore were forced to demand graduated taxation, which other individualists branded as arch-socialism.

These arguments for progressive taxation are not very strong, and if there were space it might easily be argued that if protection or benefit is to be the test of taxation, the scale should be graduated downward not upward. But it is unnecessary to do this, because the whole benefit theory of taxation has almost everywhere been abandoned in favour of the faculty or ability theory. Since individuals do not pay taxes in the ratio of the protection of the state, the arguments, whether of proportion or of graduation, founded on this theory are equally inconclusive. The give-and-take theory of taxation has been replaced by the faculty theory.

According to the faculty or ability theory, every man should contribute to the public burdens according to his ability. But does ability connote a proportional or a graduated tax? Originally taxation of faculty denoted a proportional tax on property, then a proportional tax on income. Already in the 18th century, however, the so-called "clear income" theory was developed, according to which only that part of income which exceeded what was necessary for existence was declared taxable. The minimum of existence was exempted. It is readily seen that if a definite sum is always exempt, the resulting tax would not be strictly proportional, but graduated, as to the whole income, although it would be proportional to a certain excess of income.

The original concession was soon broadened. Not only the satisfaction of absolutely necessary wants but the satisfaction of all wants now became the watchword. In other words, the idea of burden or sacrifice was introduced. Faculty or ability to pay taxes was declared to be measured by that proportion of income the loss of which would impose upon the individual an equal burden or sacrifice with his neighbour. All wants vary from the absolutely pressing wants of mere subsistence to the less urgent wants which can be satisfied by luxuries. The sacrifice involved in giving up a portion of what enables us to satisfy our necessary wants is very different from the sacrifice involved in giving up a portion of what enables us to satisfy our less urgent wants. In order to impose equal sacrifices we must tax the rich not only absolutely, but relatively, more than the poor. That is, the tax must be not proportional but progressive. It is simply an application of the final utility theory of value to taxation.

It may indeed be confessed that this theory does not logically result in any mathematically exact scale of taxation. The imposition of equal sacrifice on all tax-payers must always remain an ideal impossible of actual realisation. Sacrifice bears no absolutely definite relation to amount of commodities. No calculus of pains and pleasures can suffice. Moreover, the sacrifice occasioned by a tax, even if it were absolutely measurable, is only one factor in the problem, and may in individual cases be a minor factor. So that it is utterly impossible to say whether the identical tax on people of identical income will produce the same relative pressure or occasion an equal sacrifice. The attempt to ascertain a mathematical scale of progression must necessarily fail.

Nevertheless graduated taxation may be upheld on the faculty theory. For the elements of faculty are twofold, those connected with acquisition or production, and those connected with outlay or consumption. Now as regards the first set of elements, the possession of large fortunes or large incomes in itself affords the possessor a decided advantage in augmenting his possessions. A rich man may be said to be subject in some sense to the law of increasing returns. The more he has, the easier it is for him to acquire still more. From this point of view faculty may be said to increase faster than fortune or income. This element of taxable capacity would not illogically result in a more than proportional rate of taxation.

On the other hand, the elements of faculty which are connected with outlay or consumption bring us back to the sacrifice theory. Now while the sacrifice theory is not sufficient to make us demand any fixed scale of graduation, it cannot be claimed that it leads necessarily to a fixed proportion. If we never can reach an ideal, there is no good reason why we should not strive to get as close to it as possible. Equality of sacrifice, indeed, we can never attain absolutely or exactly, because of the diversity of individual wants; but it is nevertheless most probable that in the majority of normal and typical cases we shall be getting closer to the desired equality by some departure from pro-

portional taxation. If we take a general view and treat of the average man—and the state can deal only with classes, that is with average men—it seems probable that on the whole less injustice will be done by adopting some form of graduation than by accepting the universal rule of proportion. A strictly proportional rate will make no allowance for the exemption of the minimum of subsistence. It will be a heavier burden on the typical average poor man than on the typical average rich man. It will probably be more severely felt, relatively speaking, by the average man who has only a small surplus above socially necessary expenses, than by the average man who has a proportionally larger surplus.

Hence if we base our doctrine of the equities of taxation on the theory of faculty, both the production and the consumption sides of the theory seem to point to graduated taxation, as at all events lacking in neither logic nor justice.

Arguments against Graduated Taxation.— The arguments against graduated taxation are of two classes—theoretical and practical. In the first class the following are frequently urged :—

1. Graduated taxation is arbitrary and uncertain. This is true in a sense, but it proves too much. For an uncertain rate, if it be in the general direction of justice, is nevertheless preferable to a rate which may be more certain but less equitable. A stability which is unjust is not preferable to an instability which works in the general direction of what is recognised as justice. It is possible that the ostensible certainty of proportion may involve a really greater arbitrariness.

2. Graduated taxation is confiscation, because it must end by swallowing up the whole capital. This objection may be completely obviated by making the graduation itself degressive, so that it would become impossible to reach 100 per cent or any like percentage of large fortunes.

3. Graduated taxation is unprofitable, for the yield will be no greater than with proportional taxation. This, even if true, is no valid objection. For it assumes that the state desires to obtain larger revenues, whereas in reality it desires simply to attain greater justice. If graduation is theoretically more equitable than proportion, the given amount ought to be raised by the first rather than by the second method. If indeed graduation involved a positive loss of revenue, the case would be different. But this has been claimed by no one.

4. Graduated taxation acts as a check to industry and saving. This objection would apply only to such an excessive scale as would swallow up the entire surplus of income—and such a scale has never been known or even proposed. For if the receiver of the larger profits, after paying the graduated tax, is still in possession of a larger net income than his neighbour who with a less product pays relatively less taxes, there is no reason why he should cease to produce or accumulate. He will indeed be less wealthy than before, but his surplus will still be greater than if he stopped production. The objection is applicable to the abuse, not the use, of the principle.

The practical objections to graduated taxation are of greater weight. These are :—

1. Graduated taxation tends to augment fraud. Even under the proportional system property and income taxes in most countries, as actually administered, are honeycombed with fraud. The larger the property or income, the greater the opportunity and inducement to undervalue and conceal. The increase of the rates through graduation is apt to greatly accentuate the tendency. The greater the ostensible equality, the greater the real inequality.

2. Graduated taxation will lead to an exodus of capital. This is true only on the assumption that the system is not a universal but a particular one. If a graduated scale is applied in one town only, or in one province or commonwealth only, the tendency toward migration of capital to a neighbouring town or province will be perceptible. The larger the area of the tax system, the less the inducement to migration. But the tendency is always present although its force has often been exaggerated.

3. Graduated taxation, unless applied to the entire property or income, may work practical injustice. In the English local rates, *e.g.*, holding A may be worth more than holding B, but A may be owned by two persons and B by only one. Or the owner of the smaller holding B may have a hundred other small holdings in other parts of the town or country, while the owner of A has only that one. A higher tax on A, because it is the larger holding, would make the poorer man pay more than the richer man. Graduated taxation of property would here involve absolute injustice. The same would be true of many land taxes, of the property tax as administered in the United States, and of the income taxes in those countries where the assessment is made not on the entire income, but, as in England, separately in different schedules. This objection would not apply to cases of actual general income, or general property, or general inheritance taxes. And it is therefore chiefly in these forms of taxation that the most recent application of the graduated principle has been made. But whenever the tax is of a partial character—and this is frequently the case—graduation would be inadmissible and practically dangerous.

While, therefore, graduated taxation is on the whole defensible as an ideal, and as the expression of the theoretical demand for shaping taxes

to the test of individual faculty, it is a matter of considerable difficulty to decide how far, or in what manner, the principle ought to be carried out in practice. Theory itself cannot determine any definite scale of graduation. And considerations of expediency, as well as the uncertainty of the inter-relations between various parts of the entire tax system, should tend to render us cautious in advocating any general application of the principle.

[All the general works on the science of finance discuss this problem. For special studies see Seligman, "The Theory of Progressive Taxation" in *Political Science Quarterly*, vol. viii. No. 2.—more fully, Seligman, *Progressive Taxation in Theory and Practice*, 1894, where a complete bibliography may be found.—Cp. also Sax, "Die Progressivsteuer" in *Zeitschrift für Volkswirthschaft, Socialpolitik und Verwaltung*, 1892; Condorcet, *Sur l'Impôt progressif*, 1792.—Meyer, *Die Principien der gerechten Besteuerung*, 1883.—Neumann, F. GRAHAM, SIR JAMES GEORGE ROBERT (1792-1861), was born at Netherby, in Cumberland. He was educated at Westminster and Christ Church, Oxford; and in 1813, as private secretary to the British minister in Sicily, took part in the negotiations with Murat at Naples. After his return to England he entered upon a political career, and was returned for Hull in the whig interest in 1818. He was a close student of political economy, and now translated its principles into practical action on his father's estate. In the civilisation of the borderland and the improvement of agriculture, he did excellent work. Small tenants, who mainly lived by poaching, were replaced by thrifty industrious farmers; the breed of stock was vastly improved; cottages and farm buildings were rebuilt, and drains were introduced, large tracts of marshy land being thereby reclaimed. Under young Graham's guidance, Netherby farming gained a high reputation among agriculturists. As the result of his studies in political economy, Graham published in 1826 his pamphlet entitled *Corn and Currency*. In this treatise, which gained wide circulation, the writer demonstrated the futility of the efforts made by government to regulate by law the price of money and the price of goods. He also showed that there was an intimate relation between the corn laws and the currency, and his conclusions, as a whole, favoured free trade and free banking. He also took an active part in reforming the system of county finance. Graham succeeded to the baronetcy in 1824, and in 1826 was elected liberal member for Carlisle. In the ensuing year he was returned for Cumberland, and in matters of finance and commercial legislation associated himself with the enlightened policy of Huskisson. Economical reform early attracted his attention, and in 1830 he made his mark in the House of Commons by his motion for the reduction of official salaries, his reputation being further increased by an attack on the salaries received by privy councillors. As an advanced reformer, he was offered by Lord Grey the post of first lord of the admiralty, which he accepted, and was one of the committee of four to whom was entrusted the preparation of the first Reform Bill. While at the admiralty, Graham rendered essential service in reforming the finances of the department. Soon after this, however, he began to recede from his position as a reformer. His last attempt at economical reform was the introduction of a bill for reforming the exchequer office, which was rejected in committee. Graham's abandonment of liberal principles lost him his seat for Cumberland, but he found a refuge at Pembroke. Joining the conservatives, in 1841 he became home secretary under Sir Robert Peel. While retrograde in many matters, Graham cordially supported the free-trade policy of Sir Robert Peel. He expressed his conviction that the duty on imported corn must be abandoned, adding that "the sliding scale would neither slide nor move, and this was its condemnation." Graham supervised the measures adopted for the relief of the Irish famine, and particularly the administration of the poor law. He went out of office with Peel in 1846, and in the succeeding year was returned to the new parliament for Ripon. After the death of Peel in 1850, Graham was the leader of the small but distinguished band of Peelites, and he consistently opposed the tory efforts to restore protection. In 1852 he was elected for Carlisle, and on the formation of Lord Aberdeen's coalition ministry he returned to his old post at the admiralty. He again set himself to the task of securing administrative efficiency and economy. After the fall of the Aberdeen government Graham retained his office in the

ministry as reconstituted under Lord Palmerston, but he resigned in February 1855. Graham was haughty in demeanour, and his speeches, though sometimes brilliant, lacked spontaneity; but he was an able administrator and a model chairman of parliamentary committees.

[Torrens's *Life and Times of Sir James Graham*, 1863.—*The Times*, 26th October 1861.—*Annual Register*, 1861.] G. B. S.

GRAMONT, SCIPION DE, seigneur de Saint Germain, born in Provence during the 16th century, died, it is believed, in Venice about 1638. He was ordinary secretary of the royal closet under Louis XIII.

His *Denier Royal, traicté curieux de l'Or et de l'Argent* (Paris, 1620) is dedicated to M. de Schonberg, superintendent of the finance of France, and is written to prove that "France is one of the least oppressed (*foulé*) kingdoms of the world, and that the king does not so much burden his people as the general outcry might induce people to suppose" (p. 199). His main position is that "gold and silver, which measure the price of all things, have lost much of their former price and value by the great plenty of them which we now have" (p. 72). "The price of money, although it measures the price of other things, is not itself fixed and stable, but changes, rises and falls according to its plenty or scarcity" (p. 119). "It must be admitted that within the last century more than nine hundred millions of gold and silver have passed through the gate of Spain and entered Europe, spreading as they were attracted by the labour and industry of the different nations" (p. 136). Gramont's conclusion is that if the taxes are nominally higher than in former times, they are not so really, for "as the great quantity of gold and silver . . . has lowered their price, it is necessary that the number (of coins) should compensate (their loss of) value" (p. 262).

Gramont also clearly sees that "debtors have won what their creditors have lost" (p. 125). He, however, clings to the traditional opinion that "money does not take its value from the material out of which it is made, but from its form, which is the mark of the prince, and which could bestow value on any vile and abject matter" (p. 13). This opinion, repeated p. 18, does not agree very well with the rest of his argument.

[See Cossa, *Introduction to the Study of Political Economy* (Eng. Trans., p. 175, ed. 1893).] E. Ca.

GRAND LIVRE (Fr.). The register of the public debt of France, created under a decree of the 24th August 1793, in 229 articles, by which all the existing debts at that time were consolidated in a five per cent stock. The Great Book was to form the sole and fundamental title of the creditors of the state, and holders of scrip of all public debts—national, provincial, or communal—were required within a given time to produce their claims, the amount of which was inscribed to their credit nominatively and alphabetically. All titles to bearer were suppressed, and the measure facilitated the confiscation of the property of the church and the *emigrés*. Art. 24 of the decree declared that the interest or *rentes* due to the churches were suppressed to the profit of the republic, which would thenceforth provide for the expenses of public worship. Art. 94 ordered the extinction of all sums due to *emigrés* after payment of claims of their creditors. The total amount of the debt consolidated was 2,556,060,000 frs. in capital, and 127,803,000 frs. in *rentes* or interest. A new *Grand Livre* was created in 1797, when two-thirds of the debt were virtually repudiated, holders receiving a fresh inscription of consolidated thirds, the other two-thirds being paid off in assignats or national bonds of fictitious value. After this operation the inscribed debt, further reduced by annullations, amounted to only 40,216,000 frs. in *rentes*. Subsequent borrowings down to the present time have necessitated the opening of other sets of books, but the formula is still retained and loan bills invariably commence with the words, "The minister of finance is authorised to enter on the *Grand Livre* a sum of *rentes* sufficient to produce a capital of," etc. (see RENTE). T. L.

GRANGERS AND GRANGER LAWS. In 1867 a national secret organisation, known as the Patrons of Husbandry, was formed in the United States. Although its membership was nominally confined to those engaged in agriculture, it grew very rapidly. A local society was called a "grange"—whence the generic term. As granges, these bodies were forbidden by their constitution to engage in political discussions, but were encouraged to advance the interests of farmers along the lines of co-operation, economies in purchases, and an increase in the diversification of crops. In the south and west the Grange movement became active, and established banks, insurance companies, co-operative stores, grain elevators, and warehouses. Although a non-political organisation, it promoted anti-monopoly legislation, particularly against railroads, with a view to lower freight-rates, thus securing as was thought, a freer market for grain. Laws fixing maxima freight and passenger rates were passed in Illinois, Iowa, and Minnesota, popularly known as Granger laws. Although subject to much criticism on the ground that they were unconstitutional, they were sustained by the United States supreme court. The Granger movement declined after 1875, and the granges have retained little influence, save in some sections as social centres in farming villages. (See FARMERS' ORGANISATIONS IN THE U.S.)

[The early history is described by C. F. Adams, Jr., in the *North American Review*, 120 (1875): 394, and the later history by C. W. Pierson, in the *Popular Science Monthly*, 32 (1887): 199, 368.] D. B. D.

GRANT, JAMES (later part 18th century), entered the service of the East India Company in 1769, was made chief sherishtadar, keeper of records, under the board of revenue of Bengal in 1786, and in 1799 was still in the company's service. He wrote *An Inquiry into the Nature of Zemindary Tenures in the Landed Property of Bengal*, 1790, to show that zemindars were officials, not proprietors of the lands which they held, as payment for their services in collecting dues from the peasants, of the sovereign, the sole landowner. His views, though new at the time, have been accepted in the main.

Grant was an expert in local revenue questions, and wrote an *Historical and Comparative Analysis of the Finances of the Subah of Bengal*,—an *Historical Analysis of the Revenues of the Northern Circars*, and an *Historical Analysis of the Revenue of Bengal* (see Appendix to *Fifth Report of Select Committee of the House of Commons on the affairs of the East India Company*).

[Appendices to 2nd edition of *Zemindary Tenures*, 1791.—*List of the company Civil Servants*, 1799.—*Extracts from Harington's Analysis of the Bengal Regulations*.—Grenville's *British India Analysed*.—M'Culloch's *Literature of Political Economy*.] E. G. P.

GRANT, SIR ROBERT (1779-1838), son of Charles Grant the East Indian Director, was a barrister, a member of parliament in 1826, 1830, and 1831, judge advocate general in 1832, and governor of Bombay in 1834. A man of great and versatile ability, he wrote (1) *The Expediency Maintained of Continuing the System by which the Trade and Government of India are now regulated*, and (2) *A Sketch of the History of the East-Indian Company from its first Formation to the Passing of the Regulating Act of 1773*, both published in 1813; and (3) *A View of the System and Merits of the East-India College at Haileybury*, a speech published in 1826. The first of these works is an account of the company's government, and an argument adverse, on political and commercial grounds, to its abolition.

GRAPHICAL OR GRAPHIC METHOD. We have shown in the article on DIAGRAMS how a table of statistical figures may be represented by a curve.

This method of representation, which is much used by engineers and by experimental scientists generally, is now thoroughly established in statistical investigations of economic phenomena.

As was well said by Playfair, the earliest writer to employ this method systematically (who declares his indebtedness to his brother for its conception), when publishing his first book in 1785, we may compare the clearness of expression thus obtained, as contrasted with the difficulty experienced in grasping the same facts when expressed in a table of figures, with a map of the course of a river. This method gives, as is obvious, a much clearer idea of the country traversed than would be afforded by even the most detailed schedules of the latitude and longitude of places through which it flows.

The accompanying diagram (fig. 1) which was published in the *Times* of 2nd February 1893 shows how the fall in the price of wheat during the year 1892 is represented graphically. A single glance at this curve is sufficient to enable the mind to grasp not only the general fact of a fall in price, but also the varying rapidity of that fall in different months, and the slight temporary checks in its course.

It is clear, on a very slight consideration, that no greater accuracy can be obtained in the graphic representation than is afforded by the tables of figures on which it is based, and indeed the curve is less accurate than the statistical tables, unless it be drawn both on a large scale and with great care.

In spite of this, however, it is likely to prove far more fruitful in directing the attention to the salient features of the phenomena represented than the method of tabulating the results in schedules of figures.

In considering such a curve as that which represents the changes in the price of wheat (fig. 2) during a long period of years, the suggestion is obvious that the repeated rise and fall may be due to the operation of causes varying in intensity in different years, but recurring at regular intervals.

If the intervals between successive maxima or minima were of equal length, this conclusion would be a fair one, and it might be possible to extend the curve hypothetically so as to foretell with some degree of certainty future variations.

Such regularity is not to be found in general, owing probably to the intermingling of the effects of many causes recurring in periods of different duration.

It is possible, however, to eliminate some of the fluctuations by drawing a second curve in the manner shown in fig. 2.

In this figure the heavy line shows the variation of the annual average price of wheat, while the thin line gives the six year averages of the same prices.

If there be any cause recurring at intervals of six years, and in that period producing variations of equal amount evenly distributed on either side of the average, so that its effects, if plotted out by themselves, would give a curve regularly repeated at six-yearly intervals, the process of averaging would entirely eliminate these effects, and would leave a curve showing the effects of all other causes when this one

Fig. 1.—Price of wheat per quarter in 1892.

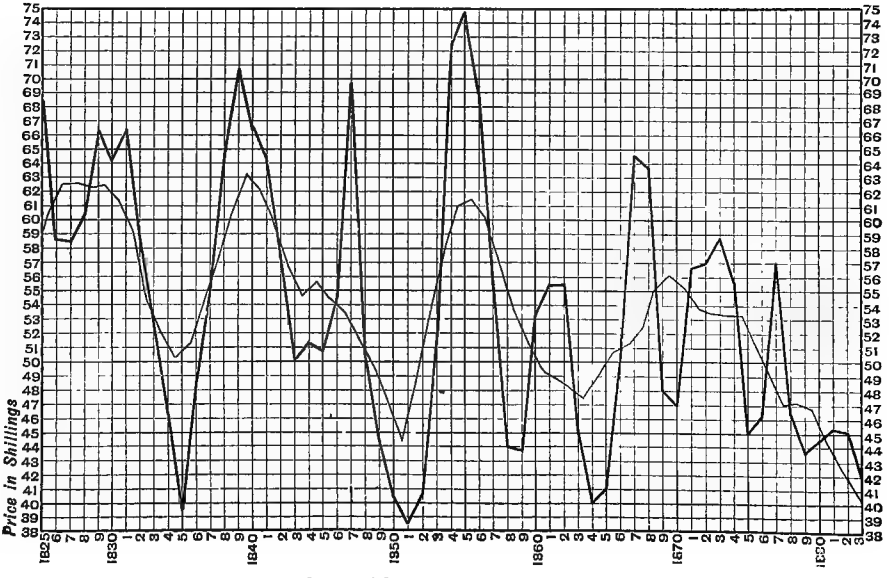

Fig. 2.—Annual and sexennial average price of wheat per quarter, 1825-93.

was omitted. Fluctuations in other periods would be represented on a reduced scale, and those, if there be any, whose period was nearly six years, would be almost completely unrepresented. A three-year or ten-year average would similarly eliminate the effects of other causes repeated at corresponding intervals.

Since the whole variation may be regarded as compounded of variations due to many periodic causes, the repeated application of this device may afford valuable information as to the nature of this complex mixture.

This subject has been carefully investigated by Prof. Poynting, whose paper on the subject in the *Statistical Society's Journal* for March 1884 is most valuable and instructive.

One obvious advantage of this smoothing process is illustrated in the above diagram, where the somewhat violent rise of price in 1847, which was not maintained, and may have been due to extraordinary causes of a temporary nature, is productive of but slight effect in the sexennial average curve, and similarly for the sudden fall in 1870, and for the rise in 1860-62.

The fluctuations of the thin curve are much less irregular than those of the thick line, and suggest a regular variation of longer period. A triennial or decennial average might afford further evidence of such a variation, which is masked in the annual average.

The comparison of two or more curves showing the variations of different phenomena, some-

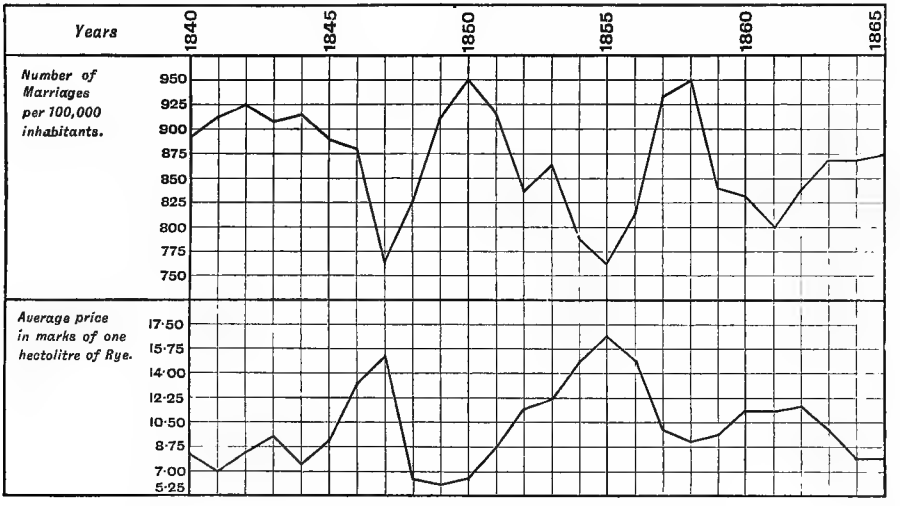

Fig. 3.—Marriage-rate and price of rye in Prussia compared, 1840-65.

times reveals a striking similarity between such variations.

Fig. 3 is a case of such comparison, which is given in Meitzen's work on statistics. In looking at the two curves side by side, it is difficult to avoid the conclusion that in Prussia, during the period 1840-65, the price of so prominent an article of food as rye, regulated in a very powerful measure the possibilities of marriage among the peasants. In other countries, and at other times, the price of food appears to have been but one among several influences of importance, and the agreement between the corresponding curves is in general less marked.

The method of comparison here illustrated has been employed by numerous investigators. Jevons's work on *Commercial Crises and Sun Spots* (in his *Investigations in Currency and Finance*) is one of those best known, and a remarkable agreement is shown between the variations of commercial prosperity and the maxima and minima of spots on the solar surface. Jevons suggested that the terrestrial weather was affected by these sun spots, and thus, through variations in the harvest, the business world was subject to their influence. It is, perhaps, hardly possible at present either to affirm or deny the truth of the connection, and it is necessary to remark that variations in different phenomena due to entirely unconnected causes may show, for considerable periods, a marked resemblance, which resemblance may be found to entirely disappear in the further history of the facts compared.

Very interesting comparisons between the changes in the prices of wheat, cotton, and silver have also been made, regarding which it should be noticed that, assuming the variations to be similar, the conclusion may be that all are due to causes so connected as to produce effects similar in kind or degree, while, on the other hand, it may be that the variation in one has been the cause of the variations in the others.

In making comparisons between two curves

such as those just referred to, it is desirable to choose such a scale for each that the range of variation is similar in both, otherwise the correspondence may be entirely overlooked. As an example of this we may take the diagram (Fig. 4) given by Prof. Marshall in the jubilee volume of the *Journal of the Statistical Society*, comparing the consumption per head of tea and sugar in the United Kingdom for the years 1860 to 1883. The consumption of sugar is represented in pounds, while that of tea is represented in two curves in pounds and ounces respectively. The comparison of the consumption in pounds would appear to indicate a much more rapid increase in the use of sugar than in that of tea, while the close correspondence between the two rates of increase is evident on comparing the consumption of tea in ounces with that of sugar in pounds.

The method we have illustrated up to the present of representing statistical tables, though that most generally employed for economic purposes, is by no means the only one used. For representing the frequency of winds in different directions, lines may be drawn from a point of such length as to represent, on a scale

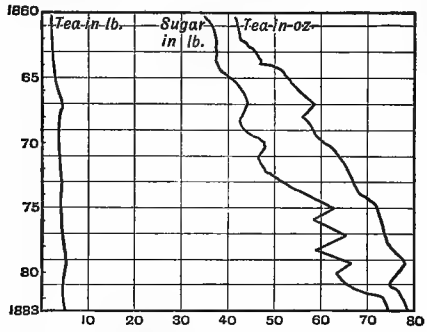

Fig. 4.—Consumption of tea and sugar per head of population in United Kingdom.

agreed on, either the frequency or the intensity of winds from that quarter. The curve which connects the extremities of these lines will express the facts required in a manner hardly possible by such curves as we have used above.

A similar mode of representation may be used to express other facts, as is illustrated in Fig. 5, which is a curve due to M. Janssens, expressing the variations in the death-rate, at Brussels, of children less than a year old and of those less than a month old.

The latter rate is represented by the small inner curve, the former by the outer one. The circle in each case expresses the average for the whole year, and where the curve falls inside it, the rate is less than the average, while in the blackened part, outside of this circle, we have represented the death-rates in excess of the average. The mode of representing time is

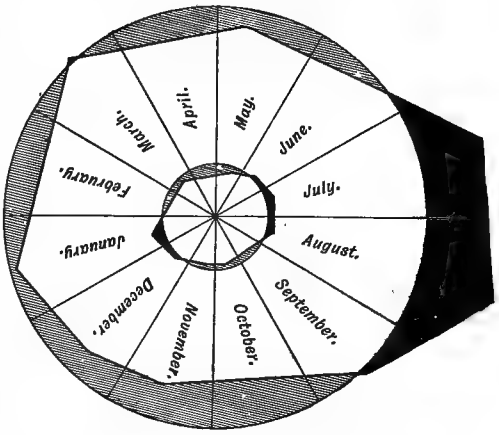

Fig. 5.—Infant mortality in Brussels.

clear from the figure, which shows that the latter part of the summer is that in which the infant mortality of Brussels is highest among children of less than one year old, while the rate exceeds the average among the very young infants both in the winter months and in the middle of summer.

It appears that this method should be especially suitable for the representation of phenomena which recur with some regularity year by year, and should enable the comparison between successive years to be made with much greater ease than is afforded by the curves of the early part of this article.

It is clear that the methods of representation referred to thus far are only adapted to display the simultaneous variations of two quantities, *e.g.* time and price. If it be required to represent the variations of one phenomenon with those of each of two co-existent causes, a surface is the suitable representation, rather than a curve on a plane.

The construction of such surfaces is so difficult that, in general, we are compelled to satisfy ourselves with a series of sections taken parallel to one or other of the three planes of reference.

A very ingenious attempt to represent the changes of economic phenomena, by the use of suitably-shaped figures having three dimensions in space, has recently been made by Dr. Irving Fisher called Stereograms. The description of the devices of this writer would require more space than can be given here, and the reader must be referred to the memoir entitled "Mathematical Investigations in the Theory of Value and Prices" in the *Transactions of the Connecticut Academy*, vol. ix., July 1892.

We can only say here that Dr. Fisher has devised a mechanical apparatus for showing how various prices are altered by a change in the supply of purchasing power, or by a change in the conditions of demand or supply of one of the commodities concerned.

Among modes of representing on a plane the shape of a solid figure, besides that of drawing a series of sections, we have the method of employing a graded series of tints or colours, the deepest tints corresponding to the highest parts of the surface or to its lowest parts at choice.

This method is now very commonly employed for the construction of maps. It is easy to see that a plan of a town which shows every street and house will, by the larger or smaller proportion of its surface occupied by lines indicating the presence of houses, reveal at a glance the comparative degree of crowding of dwellings in its different parts, and a reduced copy, so small as not to show the independent tenements, would still, by the variations in shading, show the varying density of population, so far as the crowding together of dwellings represents that density. The grading of tints shown by such a plan, may be employed for other purposes. Professor Ashley, for example, in his *Economic History*, vol. i. pt. ii. p. 304, employs such a map to show the localities which were more or less extensively occupied by enclosures in the 15th and 16th centuries.

It is obvious that differing tints of the same colour may be replaced by different colours, should such a mode of representation appear more desirable, the significance of each colour being indicated in the margin of the map or diagram.

Another method is to draw contour lines through those points on the plane where the surface, were it constructed, would always stand at the same height above the plane. A series of such contour lines gives a very fairly accurate representation of the shape of the surface. The lines of equal barometric pressure or of equal temperature on weather charts, or the lines where the soundings show equal depth on a chart of a sea or lake, are examples of the mode of representation here referred to.

Charts or maps which show, by any of the methods just named, the statistical variations of the physical or social phenomena of the districts represented, are known as CARTOGRAMS. A simpler though less effective method of indicating such variation, is to place the actual numbers referring to each district in the centre of the space on the map which represents it.

To the comparison of various quantities by drawing squares, circles, triangles, or other figures of such sizes as to be proportional in magnitude to the quantities to be compared, reference has already been made in the article on DIAGRAMS. In regard to these later modes of graphic representation, which are here discussed very briefly inasmuch as their theory is not a matter of difficulty, and in reference to the whole subject, the articles and books quoted may be consulted, and also, among other writings, the articles "La Statistique Graphique," by M. Levasseur, and "On the Graphic Method of Statistics," by Prof. Marshall, in the jubilee volume of the Statistical Society;[1] also Marey, *La Méthode Graphique*. Wm. Playfair, *Lineal Arithmetic, a Real Statement of the Finances and Resources of Great Britain*, etc.,—*Lineal Arithmetic or Charts of Commerce and Revenue*.

A. W. F.

GRASLIN, LOUIS FRANÇOIS DE (1727-1790), was from 1757 *Receveur Général des Fermes* in Nantes, where he left behind him the reputation of an enlightened and zealous administrator. His name, in token of public gratitude, has been given to one of the *places* in that town.

Graslin was a steady and consistent opponent of the tenets of the PHYSIOCRATS on the subject of the PRODUIT NET (*q.v.*) and the consequences they deduced from this principle and applied to taxation. His first work, *Sur l'influence de l'impôt indirect sur les biens fonds*, was written in 1767 in answer to a prize question put, under the influence of Turgot, by the *Société Royale d'Agriculture* of Limoges; the first prize was awarded to M. de PÉRAVY,—who was a follower of the physiocrats in their doctrine on the *produit net*,—and a *mention très honorable* was given to Graslin. Turgot answered by a criticism of Graslin's essay which has been reprinted in the large edition of his *Œuvres* (Paris, 1844, vol. i. p. 439).

Graslin also published his *Essai Analytique sur la Richesse et sur l'Impôt*, Londres, 1767, designed to prove two propositions: "the first, that the produce of land is wealth even when there is no *produit net*, namely when the cost of cultivation is equal to the value of the produce, and the second, that industry, which employs raw material produced by land, is wealth intrinsically, as well as land in its productive capacity" (p. 11). On the subject of taxation he writes: "Not only do the taxes which are improperly called *indirect* [meaning those which are not assessed on the rent of land] not necessarily fall on the landowners, but it is even possible that a tax directly levied on land may be indirectly paid by other contributors" (p. 230). He often quotes the example of Holland, and proclaims the superiority over real and personal taxes of taxes on consumption (p. 303), although he admits that things of first necessity ought never to be taxed (p. 310).

Graslin is by no means a despicable controversialist, but, as was observed by Dupont de Nemours (*Œuvres de Turgot*, i. p. 416, ed. 1844), he spoils his work by "a slight affecta-

[1] For a good example see *Return with Diagrams showing the Consumption, from 1861 up to the latest date, of Tea, Coffee, Cocoa, and Chicory, of Alcoholic Beverages, and of Tobacco, compared with the increase of population*, 329, Treasury, 1894. See also reference to stereogram in MARRIAGE RATE, also to diagram in MATHEMATICAL METHOD OF POLITICAL ECONOMY.

tion of metaphysics," and his language is often wanting in precision and accuracy.

As Graslin's work preceded the *Wealth of Nations* by nine years, it has been thought that he might have attended the course of lectures delivered by A. Smith in Edinburgh from 1751 to 1754. There is, however, no proof that this had been the case. The fact that his work bears *Londres* on the title-page does not even render it certain that he had ever been in London.

[*Correspondance Contradictoire entre M. Graslin, de l'Académie Économique de Saint Pétersbourg . . . et M. l'Abbé Baudeau, auteur des Ephémérides du Citoyen, sur un des Principes fondamentaux de la Doctrine des Économistes* (London, 1779).]

E. Ca.

GRASWINCKEL, Dirck, born 1600, studied law, became, 1645, "advocaat-fiscaal der grafelykheids-domeinen in Holland" (advocate-fiscal of the count's domains in Holland), died 1660 at Mechelen (Malines). Besides his political writings he gained great renown by his economical work: *Placaetboek op het stuk van de Leeftocht* (Collections of Edicts on the subject of Food), Leyden, 1651. The 1st part is merely historical, the 2nd, critical; it deals principally with (*a*) the question of export of corn, whether this should ever be forbidden or not. Government, he says, has a right to forbid it in periods of very high prices and famine, when every country has to take care of itself in the first place; but in other cases export ought to be free; (*b*) the question of forestalling. Though dealing in corn is to be permitted, forestalling should not be allowed.

His love for free trade in respect of exports does not prevent him from advocating import duties as a means of raising the price of corn. Like Boisguillebert, he looks on a high price of corn, although resulting from this cause, as a sign of national well-being. A. F. v. L.

GRATUITOUS UTILITY. Bastiat divides utilities into those which are *gratuitous* and those which are *onerous*, the former being free gifts of nature, while the latter directly or indirectly involve effort in their acquisition (see Goods, Classification of). It is assumed that whatever is gratuitous in the above sense is also common to all. This distinction leads up to Bastiat's characteristic doctrine that value is the relation of two services exchanged. Very briefly the argument is as follows. No one will give anything in exchange for that which can be obtained gratuitously by a mere act of appropriation; hence the phenomenon of exchange-value can arise only in connection with onerous utility. But the recipient of an onerous utility is saved an effort, and when an effort is saved a service is rendered. Hence any exchange of onerous utilities is in effect an exchange of services. This position that the source and measure of value are to be found entirely in the *services* which are embodied in onerous utilities has, as Cairnes observes in his well-known essay on *Bastiat*, "the unmistakable ring of an axiom of natural justice." "*Services pour services*"—what can be more just? We have a manifest "economic harmony." Unfortunately the term *service*, as used by Bastiat, is highly ambiguous. There is throughout more or less confusion as to whether services are to be measured by the effort exerted by the man who performs the service, by the effort saved to the purchaser, or by the usefulness of the service; and this constitutes a fatal flaw in the argument. Another fundamental distinction of Bastiat's—that, namely, between value and wealth—is based upon the distinction between gratuitous and onerous utilities. Gratuitous utilities cannot from their nature possess exchange-value. They are, however, regarded by Bastiat as very important constituents of wealth. The counter theory, which identifies wealth with value, is declared by him to be the glorification of obstacles; since, if through some revolution in nature those things which are now produced with toil and sacrifice could be obtained gratuitously, they would on this view cease thereby to be wealth. This is not the place in which to discuss the question here raised, which is one of admitted difficulty, particularly in connection with the measurement of wealth (see Sidgwick, *Principles of Political Economy*, bk. i. ch. 3). It may, however, be pointed out that whatever definition of wealth be adopted, political economy has comparatively little concern with gratuitous utilities. To a great extent they do not admit of appropriation, at any rate by individuals; if appropriated, they are still not made the subject of exchange; and they are not the produce of human labour. Hence there arise no economic problems relating either to their production or their distribution. But, on the other hand, even if they are technically excluded from wealth, the economist is bound to attach importance to gratuitous utilities whether as factors in the production of onerous utilities or as rendering the production of onerous utilities needless.
